Although converted to Christianity and baptized by the Moravians as "Gideon," Teedyuscung rarely interacted with other converted Indians. Continually opposing the authority of the IROQUOIS over his people, he mastered the art of Indian diplomacy and claimed to represent several groups of Natives in the buffer zone along the NEW YORK–Pennsylvania border. He acted as a cultural broker with colonial authorities. Teedyuscung allied with the British during the SEVEN YEARS' WAR. In his later life he falsely assumed the role of "speaker" for many Native groups.

### Tekakwitha, Kateri (Catherine) (1656–1680) *candidate for Catholic sainthood*

Known by French Catholics as the "Lily of the Mohawks" and the "Genevieve of New France," Kateri Tekakwitha

is one of the first Native American women candidates for beatification by the Roman Catholic Church. Tekakwitha led a short but difficult life. Her Algonquin mother, raised primarily by French settlers, was a Christian, and her father was a Mohawk. Both died in 1660 in an epidemic of smallpox, which left young Tekakwitha badly pockmarked and partly blind. Six years later, a French expeditionary force led by the Marquis Alexandre de Prouville de Tracy burned her village, Ossernenon.

In 1667 three Jesuit missionaries stayed in Tekakwitha's newly constructed town, exposing her to Christian theology and impressing her with their piety. On Easter Sunday 1676, Tekakwitha converted and was baptized by Father Jacques de Lamberville, a Jesuit. She took the name "Kateri" (a Mohawk pronunciation of "Catherine") at her baptism. Rebuked by other members of her tribe, who were struggling to maintain their own spiritual beliefs against the onslaught of Christian missionaries, Tekakwitha interpreted their persecution as a testament to the strength of her faith.

Tekakwitha escaped in 1677 to Kahnawake, a community of Native American Christians in Canada. There, she led a life of extraordinary sanctity, dedicating herself to prayer, penitential practices, and care for other people. She took a vow of chastity in 1679. She died a year later, but not without leaving an important spiritual legacy. Devotion to the Venerable Kateri Tekakwitha has spread among Catholics in Canada and the United States, with many making annual pilgrimages to Caughnawaga, where her relics are preserved.

—Billy G. Smith

### tenants

From the late 16th through the late 18th centuries the English moved from a feudal system to one of private landholding. The men who worked hardest for that change appropriated land and made it less available to others. Many people found themselves forced to rent land because they could not pay the fees associated with these changes. From roughly 1585 to 1763 (and beyond) English landowners tightened their grip on arable land, political power, and capital, increasingly defined those who did not own land as "the poor," and excluded these landless men from politics. Many tenants found themselves thrown into grinding, landless misery after failing to pay rents because of death, DISEASE, injury, poor harvests, or bad weather. While land practices changed in England, most of the rest of Europe maintained a system in which most people leased land for short periods of time (one to five years), paid high rent (upwards of 70 percent of their harvests), and stood well outside the world of political power.

The promise of land in the New World lured poor migrants from places like Scotland, England, Wales, Ireland,

France, and Germany. They hoped to get what they could not have at home—land—and to become independent householders. Some early colonial landowners aspired to amass huge estates to create a manorial system that resembled landed estates in Europe. They succeeded in places like NEW YORK's Hudson Valley and in MARYLAND. The availability of land in the New World made tenancy less desirable for anyone who could afford to buy it. By the end of the 17th century land sales directly to farmers made land ownership more common in America than in Europe. Even landlords in the Hudson Valley and in Maryland had to entice prospective tenants with low rent (typically 10 percent to 25 percent of their harvests) and long leases (from 60 years to two generations). Still, tenancy attracted primarily those people too poor to buy land.

Tenants throughout North America followed traditional agricultural production practices, and they tended to live frugally. Most built utilitarian houses, barns, fences, and other buildings from the lumber they harvested when they cleared wilderness. Landlords often required tenants to pay rent with a specific crop, such as wheat, but most tenants grew a variety of crops to minimize risk. If one crop failed, they could still survive off the others. In northern colonies they grew wheat, corn, oats, barley, vegetables, and cultivated some fruit trees. In the south some tried to grow TOBACCO as a cash crop. Most farmers also kept a few cattle, pigs, sheep, and chickens for FOOD and sometimes cows for milk. While men in the household worked in the fields and cared for some of the ANIMALS, their wives and daughters typically kept a vegetable and fruit garden near the house, made and repaired clothes, churned butter, cooked all the meals, and cared for the children and some of the animals. Women also worked in the fields during periods of intense labor, such as planting and harvesting. Indeed, everyone on the farm contributed to a household's success.

Tenants did not enjoy the same kinds of independence as freeholders. Many landlords restricted their access to markets and MILLS off the manor and demanded that tenants sell surplus goods to landowners first. Some tenants found their status kept them from participating in politics because nearly all of the colonies required adult males to own a certain amount of property to qualify for SUFFRAGE. Thus, they could neither vote, serve on juries, nor hold political office. As in the Old World, tenants in the New World found themselves on the outside of political power.

Tenancy increased in 18th-century British North America as population growth fueled by immigration and natural increase created more crowded conditions in many colonies, like in New England. In VIRGINIA landed tycoons kept as much as half the land in the colony off the market by requiring that rich men will their estates to only one son. At the same time, more and more people moved into the Middle Colonies, where tenancy had a foothold in the 17th

century. These migrants found that available land was in short supply because landlords refused to sell it or sold it at highly inflated prices. They had little choice but to become tenants. By 1763, even in places like MASSACHUSETTS and PENNSYLVANIA where most people had owned land, tenancy was on the rise throughout British North America.

### **Tennent, Gilbert** (1703–1764) *revivalist*

Presbyterian minister and a leader of the GREAT AWAKENING, Gilbert Tennent was born in Vinnescash, County Armagh, Ireland, on February 5, 1703. He was the first child of William Tennent, Sr. (1673–1746), a University of Edinburgh-educated Scots-Irish Presbyterian clergyman, and Katherine Kennedy, whose father was a well-known Presbyterian minister. Gilbert Tennent came to North America with his parents in 1718. While William

Gilbert Tennent (Library of Congress)

Tennent, Sr., served congregations in NEW YORK and PENNSYLVANIA, he educated his oldest son so thoroughly that in 1725 Gilbert Tennent received the degree of Master of Arts from YALE COLLEGE despite his lack of a baccalaureate degree. A moving religious experience in 1723 led Gilbert Tennent into the ministry. The PHILADELPHIA Presbytery licensed him in 1725 and in 1726 ordained and installed him in New Brunswick, NEW JERSEY. He served that and neighboring congregations until 1743.

During the 1730s and early 1740s Tennent was one of the most active “New Light” revivalists during the Great Awakening. He preached the necessity of “experiential religion” to his own congregation and sometimes intruded, uninvited, into others as well. When the English evangelist GEORGE WHITEFIELD arrived in North America in 1739, Tennent introduced him to his colleagues. He accompanied Whitefield on a preaching mission in the Middle Colonies in 1740 and to New England in 1741. Extremely censorious toward “Old Light” associates whom he suspected were not sufficiently spiritual, Tennent condemned them harshly in a sermon titled *The Danger of an Unconverted Ministry*.

The alleged enthusiastic and disorderly ministry of the Presbyterian New Lights led to their expulsion from the Synod of Philadelphia. Under Tennent’s leadership they formed the New Brunswick Presbytery and joined with northern colleagues to form the Synod of New York. In 1743 Gilbert Tennent left New Brunswick to serve Whitefield’s Philadelphia followers, who formed the Second Presbyterian Church. There he tempered his ministry, preaching to other congregations only when asked, and spoke no longer extemporaneously but from a manuscript. He explained that his new congregation needed EDUCATION, not exhortation. Tennent’s father, William Tennent, Sr., had established the “Log College” in the valley of the Neshaminy Creek in southeastern Pennsylvania, where he educated numerous Presbyterian ministers. After it closed in the early 1740s, Gilbert Tennent and others founded a college at Elizabethtown that became Princeton University. From 1746 until his death he served as a trustee of the new institution. In 1753 he went with SAMUEL DAVIES on a two-year fund-raising tour for the college. Tennent’s later moderation enabled him to assist in the PRESBYTERIANS’ reunion in 1758.

Little information about Tennent’s family life has survived. His first wife died in 1740, and he married Cornelia De Peyster Clarkson in 1742. She died in 1753. His third wife, whom he married sometime before 1762, was Sara Spoffard, with whom he had three children. Tennent’s health declined during his last two years. He died in 1764 and was buried under the center aisle of his church.

*Impact on the First Great Awakening in the Middle Colonies* (New York: Greenwood Press, 1986).

—John B. Frantz

### **Tennent, William, Jr.** (1705–1777) *minister*

Presbyterian minister William Tennent, Jr., was born on June 3, 1705, in County Armagh, Ireland. He was the second child of WILLIAM TENNENT, SR., clergyman and educator, and Katherine Kennedy, daughter of the prominent Presbyterian minister Gilbert Kennedy. His parents were Scots-Irish. In 1718 Tennent, Jr., moved to North America with his family. He was educated at what was called the “Log College” that his father founded in the Neshaminy area of southeastern Pennsylvania, primarily for the preparation of Presbyterian clergy. He studied also under the supervision of his older brother, GILBERT TENNENT, who served congregations in and around New Brunswick, NEW JERSEY.

The PHILADELPHIA Presbytery ordained and installed Tennent, as minister of the Freehold, New Jersey, congregation, where he succeeded his deceased brother, John (1706–32). He held this position until his death in 1777. Throughout his ministry he was faithful to his calling, visiting his parishioners frequently and preaching regularly to his congregation and to others who invited him. His moderately Calvinistic sermons were well received. He served as a trustee of the Presbyterian College of New Jersey, later Princeton University, and resisted vigorously Royal Governor William Franklin’s attempt to transform it into a public institution. During the GREAT AWAKENING of the 1730s and 1740s, William Tennent, Jr., was a “New Light” who participated in religious revivals. He accompanied Samuel Blair and John Rowland on evangelistic tours to MARYLAND and VIRGINIA. When the Presbyterian Church split, he became an important member of the New Light New Brunswick Presbytery and Synod of NEW YORK.

Because he concentrated so intently on his ministry, he neglected personal matters. A dishonest manager mismanaged his land and caused him to fall into debt. Too busy for romance, a friend advised that a wife could manage his finances effectively and provide “conjugal enjoyment.” The friend introduced him to Catherine van Burgh Noble, whom he married in 1738. They had six children. He died in 1777 and was buried beneath the floor of his church in Freehold.

—John B. Frantz

### **Tennent, William, Sr.** (1673–1746) *minister, educator*

Presbyterian minister and educator William Tennent was born in 1673, probably in Scotland, to John Tennent, Jr., an Edinburgh merchant, and Sarah Hume, from a powerful

Scottish border clan. In 1695 Tennent earned a Master of Arts degree from the University of Edinburgh. He was licensed by a Scottish presbytery and served briefly as a chaplain to Lady Anne, the duchess of Hamilton. By 1701 he had moved to Ireland and was received by the Synod of Ulster. Nevertheless, in 1704 he was ordained by the Church of Ireland (Anglican).

Tennent's dissatisfaction with his situation in Ireland caused him to emigrate with his wife and five children to North America in 1718, where he renounced Anglicanism and became a member of the Presbyterian Synod of PHILADELPHIA. He served congregations in East Chester and Bedford, NEW YORK, until 1726, when he moved to Bucks County, PENNSYLVANIA, and served congregations at Bensalem, New Town, and Neshaminy. At Neshaminy he made his most significant contribution.

Not only did he preach an evangelical Calvinism, but he educated others to follow his example. Having received a classical EDUCATION at Edinburgh, he taught young men, including his four sons, Hebrew, Greek, Latin, and theology. Initially he taught students in his home. In 1735, however, he constructed a building that opponents called contemptuously the "Log College." Almost all of Tennent's students became Presbyterian ministers who led the GREAT AWAKENING in the Middle Colonies. The Log College they had attended was a model for academies that they established. Increasingly infirm, Tennent began to curtail his activities in 1742. The "Log College" had closed by the time of his death in 1746.

Details about Tennent's personal life are scarce. In 1702 he married Katherine Kennedy, daughter of a prominent Irish Presbyterian minister. Because of the expenses involved in feeding and HOUSING many of his students as well as in raising four sons and a daughter, he usually struggled with indigence.

## theater

Theater had a dim reputation in 17th-century British America. Many American towns and colonies outlawed dramatic productions because supposedly they were associated with promiscuity, drunkenness, and other vices. Colonists who staged amateur productions, such as the three VIRGINIA men who were prosecuted for staging a play in 1665 or the group of Harvard students who produced *Gustavus Vasa* in 1690, often ran into trouble with authorities. In contrast, New France (Quebec) supported frequent theatrical productions from the 1640s onward.

Religious plays were particularly popular and formed part of the curriculum at Jesuit and Ursuline schools. In the West both Spanish colonists and NATIVE AMERICANS staged religious dramas for their communities.

The geography of colonial theatrical productions changed markedly in the early 18th century. Infighting between religious and civil authorities in New France led the colony's bishop to outlaw public theater (including school productions) by 1699. Subsequent French colonial productions were few and amateurish. On the other hand, the British colonies became more interested in theater as the influence of PURITANS and other religious dissenters waned. A professional theater opened in Williamsburg, Virginia, in 1717, only to close six years later. NEW YORK CITY acquired a theater in 1733, CHARLESTON in 1735. By the Revolutionary era several American cities had permanent professional theaters.

British colonial theater was an offshoot of English and Irish provincial theater; American colonists made few innovations in the genre. Young, unsuccessful, and impoverished actors immigrated to the colonies to jumpstart their careers. John Moody, an Irish actor, founded a theater company in Jamaica in 1745, and in 1749 Thomas Keane and Walter Murray organized a professional theater troupe in PHILADELPHIA. The members performed a repertoire of dramas by Shakespeare, Addison, Dryden, Fielding, and other English playwrights in Philadelphia, New York, and Virginia. Theater was a popular diversion in colonial cities (except Puritan BOSTON), but the quality of colonial theatrical productions was quite poor. Not until after the Revolution did British-Americans develop an independent theatrical tradition characterized by distinctively American settings and themes.

## Theus, Jeremiah (1719?–1774) artist

Jeremiah Theus, a colonial artist, was the son of a Swiss Protestant immigrant to Orangeburgh, SOUTH CAROLINA. He moved to CHARLESTON in 1740, where he lived for more than 30 years, marrying twice and fathering nine children. He first advertised his services as a sign and coach painter but soon managed to establish a business as a portrait artist. Early in his career Theus ran an ART school, where he taught painting "in every branch." It is not known where he acquired his skills.

His painting style remained somewhat static throughout his career, with the quality of his work only occasionally matching that of his metropolitan contemporaries.

Traveling throughout the Lower South, Theus painted hundreds of portraits of the region's wealthy planter and merchant CLASS, including Gabriel Manigault, Colonel Daniel Heyward, and Elias Ball. His prodigious output makes him one of colonial America's most important artists. Theus also contributed to one of Charleston's most impressive buildings, St. Michael's Church, where he used his skills to gild the interior and the steeple. The substantial income he received from his various pursuits made him a member of Charleston's elite. He maintained substantial properties in the town, owned four slaves, and was an active participant in the South Carolina Society—a charitable club founded by Huguenots and subsequently populated by wealthy ARTISANS and MERCHANTS. When he died in 1774, he left an estate worth thousands of pounds sterling and was eulogized in the local newspaper as having been a “very ingenious and honest man.”

—Emma Hart

### **Tituba** (1674?–1693) *accused of witchcraft in Salem*

Tituba, an enslaved woman, has become central to scholars' understanding of the 1692 Salem WITCHCRAFT hysteria. She was the first of the accused to confess, yet she was spared execution. Who was Tituba and what role did she play in this tragic drama? Historians, after hundreds of years and numerous volumes, continue to disagree and to discover new information. Earlier accounts isolated Tituba in her surroundings; historians now emphasize the cultural exchange of differing beliefs that arose between nonwhites and Puritans. Despite this progress, however, many uncertainties persist; the documentary record is thin.

Tituba's nativity and the vicissitudes of her life have confounded scholars for centuries. Historians once claimed, and some still do, that Tituba was an African. Documents most recently discovered, however, suggest that she was very likely an Arawak Amerindian born and raised in Guiana. Captured and shipped as a slave to Barbados in 1674, Tituba was purchased by Samuel Parris (subsequently a key figure in the Salem witchcraft episode), then moved first to Boston and then to Salem, Massachusetts, in 1689. By the time she arrived in Boston, Tituba supposedly had married John Indian; at some point, she may have had a child, Violet Indian.

Considered as peripheral in the past, Tituba is now indispensable to understanding the rise and spread of the witchcraft persecutions, which began when four young girls suffered from “bizarre physical symptoms,” purportedly resulting from her witchery. As a servant in the Parris household, Tituba had close contact with his daughter, Betty, one of the afflicted girls. Out of concern for the child and at the urging of Mary Sibley, a neighbor, Tituba and John Indian mixed up a witchcake of rye meal and Betty's

urine that they baked in ashes. They fed it to the dog, which was supposed to reveal who had bewitched the children. Parris learned about the cake and demanded the culprits' names. When the girls identified Tituba, the ordeal began.

Historian Elaine G. Breslaw has argued that Tituba, an Amerindian outsider, deftly and defiantly manipulated Puritan fears. As one of the first to testify during the trials, Tituba's fantastic tales of witches in Salem set the stage for the hysteria that ensued. Over 150 people were arrested on suspicion of witchcraft. Her elaborate descriptions and naming of others, combined with the girls' histrionics and Parris's bombastic sermons, contributed to condemning a number of women and a few men to the gallows. One man was pressed to death. Others languished in jail. Twenty-four people died.

Once the hysteria subsided, Tituba recanted her confession and thereby escaped execution. However, she did not escape punishment; she was confined in jail for 13 months. Furious that the court only incarcerated Tituba, Parris refused to pay her jail fees. There she remained until someone unknown purchased her in 1693. Tituba never appeared in the historical documents again.

Breslaw, *Tituba, Reluctant Witch of Salem: Devilish Indians and Puritan Fantasies* (New York: New York University Press, 1996); Peter Charles Hoffer, *The Devil's Disciples: Makers of the Salem Witchcraft Trials* (Baltimore: Johns Hopkins University Press, 1996); Bernard Rosenthal, “Tituba's Story,” *New England Quarterly* 71 (1998): 190–203; Veta Smith Tucker, “Purloined Identity: The Metamorphosis of Tituba of Salem Village,” *Journal of Black Studies* 30 (2000): 624–634.

—Leslie Patrick

### **tobacco**

The production of tobacco was a significant component of the colonial ECONOMY. The demands of that production encouraged the growth of INDENTURED SERVITUDE and SLAVERY in the Chesapeake area colonies as well as the expansion of white colonists onto Indian lands.

Many NATIVE AMERICANS cultivated *tabacum* and *rustica*, two of 60 species of the genus *Nicotiana* of the Solanaceae, or nightshade, family. They ingested it by chewing, snuffing, and drinking, and even with enemas, but mostly by smoking. Tobacco was used for medicinal, ceremonial (especially peacemaking), and religious purposes. Practice and belief varied, but hallucinations (induced by strong nicotine content or mixing with other substances) were widely construed as representing communication with spirits occupying tobacco plants.

Europeans initially viewed tobacco medicinally, especially after Spanish physician Nicholas Monardes rated it

This engraving shows tobacco leaves being pressed, cured, and packed by slaves. (Hulton/Archive)

a panacea in 1571. CONSUMPTION increased as availability rose and prices fell. English imports, 25,000 pounds in 1603, reached 38,000,000 by 1700; meanwhile prices declined from 40 pence per pound in 1618 to 1 pence by the 1660s. Mass consumption, with 25 percent of adults smoking a pipeful each day, appeared in England by the 1670s and in much of Europe by 1750. Pipes were favored initially (although Iberians, like Native South Americans, preferred cigars), but snuff became more common in the 18th century. Consumption was not restricted by CLASS, race, or GENDER, although 18th-century elites incorporated tobacco into genteel rituals, while others used “sot weed” for their own hallucinogenic and recreational purposes.

Tobacco was cultivated in Amazon settlements and Guiana from 1609, Bermuda and VIRGINIA from 1612, and MARYLAND from 1634, and the CARIBBEAN colonies St. Kitts, Barbados, Providence Island, Nevis, Antigua,

and Montserrat were founded on tobacco. From the mid-17th century island production declined in favor of cotton, INDIGO, and especially sugar.

The Chesapeake region became the New World’s largest producer, exporting more than 100 million pounds in 1771. Tobacco proved so profitable after JOHN ROLFE’s experiments in JAMESTOWN beginning in 1612, Virginians dedicated their efforts almost totally to producing tobacco and failed to grow sufficient food, thereby contributing to the colony’s near collapse. Despite falling prices and wartime disruptions, tobacco remained fundamental to the Chesapeake economy and society: “our meat, drinke, cloathing and monies,” according to Reverend Hugh Jones in 1699.

Cultivation required about 50 acres of land per worker, accounting for rapid but scattered settlement. Although LABOR intensive, the crop yielded little economy of scale,

and small farms remained common in the Chesapeake area. From the 1680s the supply of indentured servants declined, and larger planters amassed sufficient capital to buy slaves. Chesapeake area slaves increased rapidly, from 1,708 in 1660 to 189,000 in 1760, rising from 5 percent to 38 percent of the population. From the 1660s law and custom forged greater distance between the races, and this allowed development of semiautonomous African-American community, culture, and resistance. A slaveholding plantocracy appeared by the 1690s, consolidating its wealth dynastically. It developed a genteel “tobacco culture” that emerged from a consignment system of direct market and social relationships with British MERCHANTS. Material inequality rose (70 percent of white householders owned land in 1660, but only 50 percent by 1760), yet white racial solidarity increased as Euro-Americans envisioned themselves as part of a superior race. Wider access to markets, credit, and imported goods (including slaves) through Scottish merchants in the Chesapeake region raised standards of living among most white people after 1730, creating a more stable white society.

### Tomochichi (1650?–1739) chief

Tomochichi was the chief, or *mico*, of the Yamacraw tribe whose village was adjacent to John and MARY BOSOMWORTH MUSGROVE’s trading post, later to be the site of the town of SAVANNAH. Tomochichi was born in the mid-17th century and during his CHILDHOOD lived in the Creek town of Coweta. The Yamacraw were a small, isolated group who had been expelled from the main Creek lands some years earlier. Tomochichi believed that his people were best served by a close trading relationship with the English, first in Carolina, later in GEORGIA. The English provided them with weapons for defense and with trade goods. When JAMES OGLETHORPE landed on Savannah bluff in February 1733, Tomochichi was quick to forge an alliance with the assistance of the half-Creek, half-English Mary Musgrove. He summoned the Creek to meet with Oglethorpe and arranged for the first land concessions in Georgia to the English. His friendship with Oglethorpe ensured that the infant colony received supplies, advice, and technological aid from NATIVE

AMERICANS. When Oglethorpe returned to England in 1734, he took Tomochichi with him, presenting him to King George II (1727–60) and the Georgia trustees and gaining favorable publicity for the colony in the process. On his death in 1739, Tomochichi was accorded a formal burial by Oglethorpe; his tomb still stands under a monument in one of Savannah’s squares.

—Timothy James Lockley

### trade and shipping

Trade was the foundation of the early American ECONOMY, with commercial ties extending in many directions. Colonists established exchange with NATIVE AMERICANS that ranged from casual to well-developed enterprises. Settlers also participated in transatlantic trade, primarily with England and the West Indies. In addition, an internal trade network developed involving both backcountry and coastal communities. Over time the nature and extent of these networks changed, reflecting the growth and development of colonial America.

Before the arrival of Europeans, Native Americans engaged extensively in trade with one another, and archaeologists have found evidence that goods sometimes were transported across the continent. Most items traded were items of luxury rather than necessity. European colonists were often very interested in trading with Natives because animal furs and pelts gained high prices in the Old World. JAMESTOWN residents traded metal pots, fishhooks, and traps for foodstuffs and furs. MASSACHUSETTS settlers exchanged iron tools, cloth, firearms, and liquor for furs. In the Middle Colonies Indians sold fish, pelts, and venison at town markets.

In the Carolinas traders bought deerskins from the WESTO, Creek, and CHEROKEE Indians. This trade proved significant, accounting for 18 percent of Carolina’s total export earnings before 1749 and remaining at roughly 10 percent until 1775. Carolinians also engaged in trading Indian slaves. Between 1690 and 1710 perhaps 12,000 Indians were exported from the Carolinas to the northern colonies and the CARIBBEAN. This trade increased tensions between settlers and nearby Indians, set off a series of wars, and disrupted the deerskin exchange. As a result, Carolinians abandoned this SLAVE TRADE by the 1720s.

Over time the FUR TRADE became highly organized and one of the most valuable enterprises in the British and French colonies. Some tribes, acting as intermediaries, collected furs from Indians hunting as far west as the Great Lakes. The furs were then traded to colonial MERCHANTS and exported to Europe. As fur-bearing ANIMALS in some areas grew scarce, trade gradually shifted northward. The HUDSON’S BAY COMPANY, established in 1670, focused its operation on fur-rich areas in northern Canada.

Colonists also engaged in transatlantic trade. In the early years of settlement planters and merchants in VIRGINIA exported TOBACCO to England. New Englanders shipped grain and lumber to the West Indies and fish to southern Europe. In exchange colonists imported such goods as molasses, coffee, salt, and wine.

Beginning in the 1650s, Parliament began to issue a series of acts to control trade within the empire. They required that certain enumerated commodities be shipped only to England, on English ships with British (including colonial) crews. Although these policies restricted some aspects of colonial trade, they also protected and stimulated many commercial enterprises. Colonists had a guaranteed market for many of their exports. Their SHIP-BUILDING industry also profited; by the mid-18th century nearly one-third of all British ships were American made. Moreover, many policies were often evaded by colonists and not strictly enforced by Parliament.

The American colonies formed an important link in the transatlantic trade that saw goods flow to and from colonial North America, the West Indies, and England. American merchants shipped furs, naval stores, tobacco, rice, and INDIGO to England. They exported grains, fish, lumber, and livestock to the West Indies. In return colonists imported manufactured products from England and slaves and molasses from the West Indies. Through this route most black slaves were brought to the British mainland colonies.

Between 1619 and 1760 approximately 400,000 slaves were brought to the thirteen colonies. British slave-trade companies supplied the bulk of the slaves, but American merchants, most of them based in RHODE ISLAND, organized the sale of slaves in the colonies. During the 18th century Rhode Island merchants controlled 60 to 90 percent of North America's trade in African slaves.

The colonies also developed internal trade networks. Backcountry farmers sold surplus grain and fresh vegetables to coastal communities. Rice and tobacco from the southern colonies were shipped north and exchanged for meat and grain. By 1760 roughly 30 percent of the total tonnage of colonial ships was destined for other American mainland ports.

These various trade connections combined to stimulate growth and development. The populations of port cities like BOSTON, NEW YORK CITY, and PHILADELPHIA increased, as did job possibilities for merchants, shopkeepers, shipbuilders, ARTISANS, and others in trade-related industries. This intercolonial trade likewise promoted the development of roads and interactions among colonists.

The changing dynamics of trade with England reflect the maturing of colonial America. During the early 17th century the value of exports far exceeded the value of imports, reflecting the relatively low standard of living con-

sistent with early settlement. By the early 18th century the value of imports from Britain was greater than exports to the mother country; this trend continued throughout the century. This transformation in trade indicates the changing consumption patterns of North America before the Revolution.

## travel

Early Americans traveled primarily for work. Judges moved from town to town to preside at circuit courts. Ministers, who were responsible for more than one congregation or had no fixed place, traveled to folks eager to hear them preach. Peddlers took to the roads to sell their wares, and traders moved around in the colonial interior to exchange goods with Indians. Occasionally, travel was motivated by an official function. WILLIAM BYRD II journeyed with a small group to mark the boundary between Carolina and VIRGINIA. Colonial leaders met with NATIVE AMERICANS to negotiate treaties and form trading partnerships. Representatives left home for meetings of the assembly.

Water transportation offered the easiest, cheapest, and most favored form of travel. PENNSYLVANIA farmers avoided the bumpy wagon ride by loading their grain onto shallops and relying on the network of rivers to move their produce to market. Southern planters transported their TOBACCO from their farms to the docks of JAMESTOWN or CHARLESTON for shipping to European or British markets. Because tobacco was bulky and fragile, they avoided the jostling from uneven roads and depended upon inland waterways to carry their crop to eastern ports. According to one source, "it was easier and less traumatic in good weather to sail from London to Boston than to reach Charleston from Massachusetts by horse."

Taverns were the first hotels and motels in early America. By law they were required to provide nourishment and lodging for humans and horses. The 1692 MASSACHUSETTS law was typical: "The ancient, true and principal use of Inns . . . is for the Receipt, Relief and Lodging of Travellers and Strangers, and the Refreshment of persons upon lawful Business." Colonial authorities tried spacing taverns at convenient distances; if an individual wished to open a tavern, claiming that they were conveniently located on a well-traveled road offered the most compelling argument. Because people used both land and water transportation, public houses in the Middle and New England colonies were located on public roads and

ferry landings. Very few taverns existed in the Chesapeake region, Lower South, and western regions of the colonies. While surveying the Virginia-Carolina border, William Byrd and his party were forced to camp for much of their journey. Travelers in these regions often had to impose upon private homes for lodging. Virginia law acknowledged the inadequate number of taverns by requiring plantation owners to furnish lodging for passersby.

Travel for most colonists was uncommon. The vast majority of early Americans rarely ventured beyond home, church, and fields, with an occasional trip to market. Only wealthy individuals had the luxury of travel for leisure. Dr. Alexander Hamilton, for example, journeyed from his home in Annapolis, MARYLAND, to New England and back seeking a cure for his ill health. Sons of elite planters or New England leaders often crossed the Atlantic for a European tour or for advanced EDUCATION. Elites moved from their city homes to their country dwellings to escape the summer epidemics.

If travel was unusual for most colonists, it was even rarer for women. SARAH KEMBLE KNIGHT, who journeyed from BOSTON in 1704, complained bitterly about having to stay in taverns, but she was unable to avoid them altogether. At Mr. Havens's inn she was disturbed all night by "the Clamor of some of the Town toppers in the next room, Who were entred into a strong debate." Women did venture inside the tavern. However, respectable women preferred to avoid the discomfort and the risk to their reputations.

The mode of transportation was related to an individual's social and economic status. The earliest settlers moved around primarily on foot. Once horses were introduced, only poorer members of society continued to walk. When Benjamin Franklin moved from Boston to PHILADELPHIA, he followed a typical pattern. He started his journey by sea and then walked from Amboy to Burlington, NEW JERSEY.

Stagecoaches improved travel markedly. They first appeared in 1752, covering the 50 miles between Burlington and Amboy, New Jersey. From these points ferries connected travelers with Philadelphia and NEW YORK CITY. Another stage route linked these two port cities in 1766. If the weather cooperated, travelers could expect to make the trip in two days. One year later stagecoach service was established between Boston and Providence. Soon after, the stagecoaches connected Salem with Boston and Boston with Portsmouth, NEW HAMPSHIRE. The reliability of the stagecoach increased the amount of travel in the colonies.

### **Turell, Jane Colman** (1708–1735) *writer*

Born into a BOSTON Congregationalist family, Jane Colman was precocious, memorizing scripture and reciting the catechism at an early age. Her minister father, Benjamin, to

whom she remained close all her life, encouraged her intellectual development, praising her couplets and hymn lyrics and engaging in epistolary dialogues to improve her writing skills. Poor health resulted in a sedentary CHILDHOOD, and by the age of 18 she had read every volume in her father's library, frequently staying up all night with a book.

At 19 Jane Colman married Ebenezer Turell, a Harvard-educated minister, and they moved to Medford, MASSACHUSETTS. Turell continued to write after her marriage, reading daily and setting aside time each month to compose. The Turells had four children, only one of whom survived infancy. The stress of repeated pregnancies, in addition to her poor health, probably hastened Turell's early death.

Women who pursued literary activities in early America stepped outside the usual female role. Even her supportive father reminded Turell not to prioritize writing over her traditional duties; Turell admitted that she found this difficult. She never sought publication, instead distributing her work privately among friends and family. Although Turell wrote in a variety of ways and on many topics, the only writings that remain are the ones that Ebenezer Turell chose to publish with his memoir. He destroyed her humorous essays so that all would know she prioritized religion, morality, and childbearing.

### **Tuscarora**

During much of the colonial period the Tuscarora Indians inhabited the region of western NORTH CAROLINA known as the Piedmont. Linguistically, they were distantly related to the Five Nation IROQUOIS of upstate NEW YORK. At some point in the pre-Columbian period they had separated from them and relocated in the South, where they engaged in a mixed ECONOMY of hunting, gathering, and AGRICULTURE. The Five Nations (Seneca, Cayuga, Onondaga, Oneida, and Mohawk) occupied a very powerful position in the East, and the Tuscarora maintained an alliance with them through much of the colonial period. The Iroquois frequently traveled to the South on raids against their joint enemies, the CATAWBA. The Tuscarora, speaking an Iroquoian language and knowledgeable about the Piedmont region, were a valuable ally to the Five Nations.

During the colonial period the Tuscarora became heavily involved in trade with the British. By the 1700s Indian nations were jockeying for position with the Europeans to receive the best and highest quantity of trade goods. This issue, as well as British encroachment on Tuscarora lands, made the Piedmont a tremendously volatile place. Furthermore, British colonists seeking Indian slaves paid

the Tuscarora's enemies handsomely to raid their villages and capture them. In retaliation for this and other offenses, the Tuscarora killed an English trader and attacked the English settlers' plantations in an event known as the TUSCARORA WAR (1711–13).

The North Carolina colonists received help from SOUTH CAROLINA, which sent troops to defend the colony. The joint force from the Carolinas routed the Tuscarora, driving them into the interior. After suffering hundreds of casualties, the Tuscaroras assessed their situation and arranged to move northward to join their allies among the Five Nations Iroquois. Although the Tuscarora had been negotiating with the Five Nations before the war, their recent losses made their situation desperate, and they moved into the region occupied by the Oneida. In the early 1720s the Iroquois officially accepted the Tuscarora as the Sixth Nation, giving them the right to speak in the confederacy's councils. After the 1720s the Iroquois as a whole suffered from a gradual loss of autonomy. With the Tuscarora's fortune tied to the confederacy, they suffered when the SEVEN YEARS' WAR ended with the French departure from North America. Without the need for an Indian ally against their French and Indian foes, the British took greater license in encroaching upon Iroquois lands in upstate New York.

### Tuscarora War (1711–1713)

The Tuscarora War was a conflict in a region now encompassed in the state of NORTH CAROLINA between the English settlers of the Carolinas and their NATIVE AMERICAN allies and the TUSCARORA Indians. The area to the west of the coastal plain in the American South, called the Piedmont, had been the site of numerous skirmishes between the Tuscarora, settlers from VIRGINIA and the Carolinas, and other Indian tribes. By the early 18th century most tribes in the Southeast had become heavily

dependent on European trade goods such as guns, metal cooking utensils, and metal tips for arrows. As the Indians became increasingly dependent on their European neighbors for trade, the English settlers grew more desirous of Indian lands in the Piedmont. For the Tuscarora this was extremely problematic, as they were the easternmost tribe in the Piedmont. As Carolina settlers were encroaching upon their lands, they were also using the Tuscarora's enemies to raid their towns, capturing Tuscarora villagers and selling them to the Carolina planters as slaves. Devastated by these events, the Tuscarora sought council with their allies, the Five Nation IROQUOIS from upstate NEW YORK, who shared many of the Tuscarora's enemies and with whom they were linguistically related.

During a council with the Iroquois in 1710, the Tuscarora asked the Five Nations to allow them to live in Iroquoia (the upstate New York territory occupied by the Iroquois Confederacy) to escape the frequent abuse by their neighbors. However, while negotiations were underway, the Tuscarora at home captured and killed a British trader named John Lawson. After the murder the Tuscarora swept through the Carolina plantations in violent retaliation for the incursions on their land. North Carolina, fearful of further attacks, solicited help from their SOUTH CAROLINA neighbors. The South Carolinians forged a two-pronged attack, one led by John Barnwell, the other by James Moore, Jr. Made up of settlers as well as some Shuteree, Sugaree, and Cheraw enemies of the Tuscarora, the war parties fell upon the Tuscarora, killing many of them and capturing others, who were then forced into SLAVERY in the South. Those who escaped fled to the Oneida, one of the eastern members of the Iroquois Confederacy, where they found refuge. The Tuscarora lived in the Susquehanna Valley of New York and eventually became the Sixth Nation of the Iroquois Confederacy in the early 1720s. The war remained in the minds of many Tuscarora, who, with their new allies, continued to raid the southern tribes in the next decades.

## **Van Rensselaer, Maria Van Cortlandt** (1645–1689) *businessperson*

Maria Van Cortlandt Van Rensselaer was a tenacious woman who administered one of the major land grants in the NEW YORK colony for more than 12 years until her son could inherit it. Born in NEW AMSTERDAM in 1645, Maria Van Cortlandt married Jeremias Van Rensselaer, the director of the patroonship of RENSSELAERSWYCK, when she was 16 years old. After 12 years of marriage, her husband died, leaving her with six young children and a disputed claim on the 1-million-acre estate.

With no adult children to assume her husband's responsibilities, Maria Van Rensselaer managed the patroonship for slightly more than 10 years. She negotiated land deals, collected rents, administered an extensive payroll, oversaw the construction of houses, and marketed beavers, planks of wood, grain, butter, peas, cattle, and horses to NEW YORK CITY, BOSTON, the West Indies, and various Indian groups. This prodigious activity yielded little profit, a source of great concern to family members in North America and in Holland who benefited from the proceeds of the patroonship.

While sorting through complex tax matters, title claims, and the debts incurred by her husband's family, Van Rensselaer also contended with challenges to her son's right to inherit control of the patroonship. Family members in Holland as well as in-laws in America tried to control the estate or to expropriate large pieces of territory. Maria Van Rensselaer prevailed over the Livingstons, the Schuylers, and the Dutch Van Rensselaers to see her son come into his inheritance with a clear patent from the English royal governor in 1685. She had little time to savor the quiet life she so craved, dying just two years after her son's patrimony was secured.

Her letters from this period survive and chronicle the bad harvests, calculating politicians, grasping relatives, and irate TENANTS with which this physically frail woman had to contend. In one of those letters, she described herself as

a “sorrowful widow who with God’s help . . . seeks to bring up her children and tries to satisfy every one, which in the sorrowful state in which I am at present often makes me sigh.” Despite setbacks, Maria Van Rensselaer managed to keep her “colony” intact for more than a decade.

## **Vargas, Diego de (Diego de Vargas Zapata y Luján Ponce de León y Contreras, Don Diego de Vargas)** (1643–1704) *government official*

Spanish colonial governor of NEW MEXICO, Diego de Vargas (Diego de Vargas Zapata y Luján Ponce de León y Contreras) was chosen to retake New Mexico after a successful rebellion by NATIVE AMERICANS. In 1680 the PUEBLO Indians revolted after decades of forced religious conversion, mandatory labor, and the destruction of traditional life patterns. They drove the Spanish south to El Paso, Texas, and killed more than 100 Spaniards. Two factors, to establish defensible territory against Native American attack and to recolonize through mission-building, especially in the face of European competition, were the essential elements that led to de Vargas's reconquest of New Mexico. De Vargas himself was eager to retake the lands he had been driven from a decade earlier.

De Vargas's first duty was to quash rebellious Pueblo Indian tribes in the area of El Paso. The Pueblo tribes pledged their loyalty to the returning Spanish governor and his forces, who then marched on to reconquer Santa Fe, New Mexico. Pueblo Indians in the Santa Fe area were surprised by the return of the Spanish and submitted to De Vargas's return. He was also able to convince the Indians of his intent to reestablish Spanish rule peacefully, and he gave pardons to all the Pueblo involved in the revolt.

De Vargas's initial return to New Mexico was to secure reconquest. With a semblance of security reestablished, he began to focus on colonization. He returned to New Mexico in 1693, bringing settlers, friars, and more soldiers with him. Many Pueblo Indians rose up against Spanish rule, forcing De Vargas again to capture Santa Fe. Despite this and other small-scale confrontations in 1696, de Vargas was able to maintain the Spanish hold on New Mexico. Apache Indians killed de Vargas during a campaign in 1704.

## Vermont

Originally inhabited by the Abenaki tribe, the area that would become Vermont was first explored by Europeans in 1609, when it was claimed for France by the SAMUEL DE CHAMPLAIN expedition. French settlers occupied Isle La Motte in 1666, an area claimed by both the French and the Dutch under vague and largely unsurveyed land grants. By 1724 a number of Dutch squatters, fleeing the NEW YORK tenant system, had settled on the Hoosic River, many believing themselves to be in French Canada. Although the 1763 Treaty of Paris placed the entire region in British hands, negating the French and Dutch claims, it introduced new problems as the colonies of both New York and NEW HAMPSHIRE issued land titles in the area to speculators. By 1764 more than 20 townships were sponsored by New Hampshire speculators, leading to New York efforts to dislodge them. Some settlers, like Ethan Allen and his family, took advantage of the situation and bought New Hampshire grants while using force to drive off the New Yorkers. In 1777 Vermont declared itself independent and remained a separate republic until 1791, when the federal government reached an acceptable compromise over the New York grants, and Vermont joined the union as the 14th state.

## Virginia

Virginia was the first permanent English settlement in North America. Two earlier British colonization attempts, at Roanoke Island in present-day NORTH CAROLINA and at Newfoundland, ended in disaster. Still, James I hoped to

give the English a foothold in the New World and provide a bulwark against Spanish settlements in the CARIBBEAN. In 1606 he granted the VIRGINIA COMPANY OF LONDON, a joint-stock company formed to speculate in American lands, a patent to an enormous region of southern North America, stretching from the CHESAPEAKE BAY to the Pacific coast. In May 1607 the Virginia Company founded a settlement at JAMESTOWN on the James River, which flows into the mouth of Chesapeake Bay.

Virginia Company entrepreneurs cherished grandiose visions of the colony's potential, both as a tool for Christianizing and "civilizing" local NATIVE AMERICANS and, still more importantly, as a supplier of precious metals, furs, and other valuable raw materials, but the colony floundered because the Virginia Company settlers refused to perform the agricultural and other LABOR necessary to support themselves. They neither farmed, fished, hunted, nor gathered; observers reported that men died of sheer "idleness." The Jamestown settlement was organized as a military expedition, and the Virginia Company's servants likely expected to live off the land and endure high death rates. The English settlers may also have suffered from pellagra, a nutritional DISEASE that leads to apathy and anorexia, or from dysentery resulting from drinking polluted water from the James River. Whatever the cause, however, the first years of the Jamestown settlement were a bitter tragedy of violence, MORTALITY, disappointed hopes, and squandered opportunities.

The Native Americans who lived along the Chesapeake Bay viewed the English settlement ambivalently. At the beginning of the 17th century approximately 20,000 Native Americans lived in the Chesapeake region. The region's preeminent political power was the POWHATAN CONFEDERACY, a diplomatic league of 32 ALGONQUIN-speaking tribes founded by POWHATAN's father in the 16th century. Powhatan, who led the confederacy when the English arrived, hoped to establish a lucrative trade with the new settlers; indeed, he gave them maize to help them through the first difficult winters in Virginia. However, in 1609 the English settlers, who had grown dependent on the crops supplied by Powhatan's people, began to raid Native American communities for FOOD. In an illogical burst of anger, the English killed the Indians who had been supporting them and destroyed their crops. Powhatan retaliated by trying to starve the English settlers out, resulting in catastrophic mortality.

The Virginia Company did not accept defeat; it shipped many new immigrants and livestock to Virginia to revive the faltering colony. Moreover, it launched a vigorous war against the Powhatan Confederacy. By 1613 the Virginia Company colonists dominated the region between the James and York Rivers, and in 1614 Powhatan reluctantly accepted a peace treaty. Virginia's disastrous early years

were followed by a decade of unsteady growth in which several important precedents were set. In 1612 JOHN ROLFE began experimenting with a hybrid strain of TOBACCO that was particularly well suited to the Virginia climate, and for the first time Virginia Company speculators began to see a return on their investments. The introduction of tobacco profoundly affected Virginia's social and economic structure. It was a highly labor-intensive crop and so, in order to recruit sufficient labor, the Virginia Company established the headright system in 1616. It granted a specified number of acres to each immigrant or the person who paid the immigrant's passage and encouraged immigration (by families and single women as well as men); some wealthy colonists amassed substantial plantations by importing indentured servants from England and collecting their headrights. African slaves were first brought to the colony in 1619, but early planters relied mainly on the labor of white indentured servants. In 1619, too, the Virginia Company convened the HOUSE OF BURGESSES, the first representative assembly in colonial North America.

Nevertheless, the Virginia colony remained highly unstable. A series of typhus and dysentery epidemics washed over the settlement between 1617 and 1624; by 1624 more than 85 percent of the colonists who had immigrated to Virginia since 1607 were dead. Meanwhile, Powhatan's successor, OPECHANCANOUGH, marshaled anti-English forces with the Powhatan Confederacy and on Good Friday, March 22, 1622, launched a surprise attack on the Jamestown settlement, killing nearly 350 people, a quarter of Virginia's English population. This attack initiated a destructive 10-year war, but the English Crown did not wait until the war's end to reorganize the colony's government. In 1624 the Crown revoked the Virginia Company's charter and made Virginia a royal colony.

The first decades of royal rule were a prosperous period for the English colony in spite of the continuing problems of disease, famine, and war. By 1640 Virginia's English population had risen to 10,000, while the region's Native American population had declined to an equal

An engraving of a map of Virginia by Ralph Hall (Hulton/Archive)

number. In 1645 the English settlers finally captured Opechancanough; his execution marked the eclipse of the Powhatan Confederacy, whose power declined steadily thereafter. Although the English had conquered Virginia, settlers continued to live in squalid conditions; even the wealthiest planters occupied rough houses of one or two rooms. At least three-quarters of immigrants arrived as indentured servants, having bartered their labor for a number of years (usually between four and seven) in exchange for passage to Virginia. Most indentured servants were single young men; the colony's GENDER ratio was highly imbalanced throughout the 17th century. Free women married quickly (men who courted female indentured servants sometimes offered to buy their freedom), and the high mortality rate enabled planters' widows to amass substantial estates, making them prizes on the marriage market. Tobacco remained the principal crop; soil exhaustion pushed English settlers farther and farther into what had once been Indian territory.

In the 1670s long-simmering social tensions erupted in a violent episode that became known as BACON'S REBELLION. The Susquehannock Indians, who lived along the upper Potomac River, opposed white settlers' encroachment on their land. In response Nathaniel Bacon led frontier planters and landless settlers on raids of Indian villages, killing many Natives. Virginia governor SIR WILLIAM BERKELEY tried to suppress Bacon's raids to preserve social order, but his opposition exacerbated a second axis of conflict: that between the established Virginia gentry and restless freedmen (former indentured servants), who embraced Bacon as their champion. In the spring of 1676 Bacon's troops looted and burned Jamestown. The rebellion collapsed quickly after Bacon's death in October. Nevertheless, it profoundly frightened the planter gentry and probably spurred the transition to slave labor in the colony in the late 17th and early 18th centuries.

Virginia planters adopted slave labor for several other reasons. By the late 17th century economic conditions in England had begun to improve, stemming the flow of indentured servants to British North America. At the same time Virginia's demographic regime stabilized so that the majority of European and African immigrants now survived their first few years in the colony. Slaves cost more than indentured servants; it was not cost effective to purchase slaves unless most of them survived longer than a typical indentured servant's term of four to seven years. Around the 1670s, however, it became clear that slaves were a better long-term investment. In addition, the supply of slaves increased and their price declined. The wealthiest planters consequently began to switch from servant to slave labor. Social tensions contributed to their choice; the supply of good land available to ex-servants was decreasing,

and established planters did not want to expand the pool of restless freedmen, laborers, and squatters who threatened their hegemony. By 1700 slaves probably outnumbered indentured servants. Virginia planters did not make the transition from servant to slave labor all at once, however. White indentured servants continued to labor beside African and African-American slaves on Chesapeake area plantations well into the 18th century.

This important transition to SLAVERY was accompanied by the expansion and codification of Virginia's black code. Initially, slavery was regulated by local custom rather than law; many mid-17th century African laborers held an ambiguous status between servant and slave, and quite a few eventually obtained their freedom. In the 1660s, however, the House of Burgesses began to pass laws defining slaves' status as property and blocking off potential paths to freedom: Children of slave mothers were deemed to be slaves; conversion to Christianity did not justify emancipation; the murder of a slave by his or her master did not constitute a felony; slaves could not own firearms. Wealthy planters probably hoped to co-opt the political support of poorer white people by attaching political value to "whiteness"; the concepts of black slavery and white liberty became intricately entangled in the minds of 18th-century white Virginians. In 1705 the Burgesses' restrictive laws were collected in a comprehensive Virginia Slave Code. By then the vast majority of Africans and AFRICAN AMERICANS living in Virginia were held as slaves.

Between 1700 and 1770 approximately 80,000 slaves were imported to Virginia and MARYLAND. Most grew tobacco on properties that ranged in size from small farms, where a handful of slaves and servants labored beside the white family, to sprawling, villagelike plantations worked by 100 or more slaves. Eighteenth-century Virginia slaves were healthier and longer-lived than their counterparts in the Caribbean and South America due to better nutrition, a less extreme work regime, and a less deadly disease ENVIRONMENT. By the 1730s the Virginia slave population had begun to grow by natural increase; it was the first slave population in the Americas to do so. Over the course of the 18th century slaves created a syncretic African-American culture, fusing social and religious traditions from several regions of AFRICA with European influences. MUSIC, DANCE, funeral rites, naming patterns, and CREOLE dialects that blended vocabulary and grammatical patterns from various African and European languages all played a pivotal role in early African-American culture. In the 1760s and 1770s many African-American slaves converted to Christianity and began to fuse Christian beliefs and customs with African religious traditions to form a distinctive mode of Afro-Christianity. African-American culture also influenced white Virginians' material culture, accents, musical tastes, and cuisine.

Virginia was not only the oldest of Britain's mainland North American colonies but also the most populous. After the early years its population grew steadily from 18,700 people in 1650 to 58,600 in 1700 and 340,000 in 1763. Slaves constituted slightly more than a quarter of Virginia's population in 1700 and more than 40 percent by 1760. The colony's white social structure included large planters who owned 20 or more slaves and from one to several plantations; small planters who owned fewer than 20 slaves and one small-scale plantation; backcountry and tenant farmers who grew tobacco and cereal crops on small farms, relying primarily on family rather than slave labor; and indentured servants. ARTISANS and shopkeepers congregated in small towns such as Williamsburg, but in spite of the House of Burgesses's attempts to encourage the creation of towns, Virginia remained overwhelmingly rural throughout the colonial period. The county was the principal unit of local government; in the absence of towns, colonists congregated at court days, militia musters, and rural stores and taverns. In 18th-century Virginia about 60 percent of adult white men held enough land to qualify for the vote. This was an unusually broad SUFFRAGE by European standards. Large planters monopolized the House of Burgesses, which soon superseded the governor's council in political influence.

Eighteenth-century Virginia was a firmly hierarchical society. The Tidewater gentry exercised power not only through political and judicial service but also through patronage and material display. In contrast to 17th-century planters, who often lived in small, bare houses, their 18th-century counterparts constructed elegant Georgian mansions on their estates. Weddings, funerals, and other lifecycle events were celebrated with elaborate banquets and parties that could last as long as three days. Churchgoing was another important occasion for social display; the local elite congregated in the churchyard and made a regal entrance just before the service began. Large planters often marketed tobacco, obtained consumer goods, and did business for smaller neighboring planters, thus drawing them into semidependent relationships. It was also customary for political candidates (mostly large planters) to "treat" voters (mostly small landowners) with liberal allowances of FOOD and ALCOHOL on election days, effectively purchasing their votes not with money but with promises of hospitality and patronage. The social status of the Tidewater gentry within the larger BRITISH EMPIRE remained ambiguous, however. In spite of the enormous influence they exercised in Virginia, many of them struggled with a perennial sense of cultural inferiority to the British gentry they sought to emulate.

The backcountry's social structure differed considerably from that of the Tidewater region. Although many wealthy planters speculated in backcountry lands, few

actually lived in that region, nor were there many slaves in the colonial Virginia backcountry, because most backcountry farmers could not afford to purchase them. After the 1720s new immigrants, many of them German and Scots-Irish, flooded into the Virginia Piedmont; by the 1750s European settlement had reached the edge of the Appalachian Mountains. The new immigrants raised livestock and grew cereal crops and low-grade tobacco on the rich Piedmont soil. Some enjoyed a comfortable standard of living, although they never approached the Tidewater gentry in wealth or political influence; the poorest were squatters, who led a precarious existence without legal title to their land. In the wake of the SEVEN YEARS' WAR the British government attempted to relieve tensions between white settlers and Native Americans in the Ohio Valley by issuing the Proclamation of 1763, which forbade white settlement west of the Appalachians. Many frontier settlers resisted this decree, which contributed to Virginians' growing resentment of British colonial rule.

Virginia's early intellectual and religious life was relatively calm and undistinguished. Because Virginia was a royal colony, the ANGLICAN CHURCH was established as the colony's official church, and all taxpayers contributed to its support. Most white Virginians adhered to the Anglican Church, at least nominally, but the Chesapeake region lacked the religious fervor of the Puritan and Quaker colonies. Anglican clergymen—mostly ENGLISH IMMIGRANTS—exercised little social authority. New backcountry settlements often lacked churches; itinerant ministers performed marriages and baptisms, although many couples cohabited without marrying. The educational situation was similarly bleak. In the 17th century schools were few and far between; wealthy planters sent their children to England for schooling, others simply did without formal EDUCATION. In the 18th century many planter parents hired private tutors for their children or sent them to small local schools, but offspring of poorer families enjoyed little chance to study. The COLLEGE OF WILLIAM AND MARY was established at Williamsburg (soon to be the new capital of Virginia) in 1693. The college's elegant buildings introduced the Virginia gentry to the architectural principles of Christopher Wren and inspired a spate of mansion construction, but the college's academic standards were initially low. Careful parents sent their sons to northern institutions to protect them from the dissipations of Williamsburg.

The character of Virginia's religious life changed dramatically during the GREAT AWAKENING, a wave of evangelical religious revivals that spread throughout the mainland British colonies in the mid-18th century. The Great Awakening reached the Virginia Piedmont in the mid-1740s, but its full effect was not felt until the 1760s. Every layer of Virginia society, from rich planters to slaves,

responded to evangelical preaching. The BAPTISTS and METHODISTS, the two leading evangelical denominations, grew rapidly; the revivals also reshaped and invigorated Scots-Irish Presbyterian congregations. Intriguingly, evangelical PROTESTANTISM attracted many African-American slaves to Christianity for the first time. Slaves attended revivals, preached, and joined Baptist and Methodist congregations; for a few decades in the late 18th century many Virginians belonged to interracial churches. (In the early 19th century most of these congregations splintered into separate African-American and white meetings.) The Great Awakening utterly transformed Virginia society in the decades before the American Revolution. Indeed, the revivalists' preaching style and their emphasis on challenging established authority may have prepared Virginians to embrace the Revolutionary rhetoric of liberty. As the largest and oldest mainland colony, Virginia was often in the spotlight and played a leading role in early Revolutionary protests.

### Virginia Company of London (1606–1624)

Responding to a petition to private individuals with connections of family and interest in Raleigh's and Gilbert's earlier colonies, James I promulgated a charter in 1606 authorizing new English colonies in America under the aegis of two joint-stock companies: the Virginia Company of London, whose grant allowed them to plant colonies from present-day NORTH CAROLINA to Long Island, and the Virginia Company of PLYMOUTH, with colonization rights extending over the New England area.

The Virginia Company of London was primarily a business venture whose goal was to realize a profit, although the company's appeals for investors were couched in terms of broader national and religious interests. A factional cross-section of the English aristocracy capitalized

and led the Virginia Company of London, which established the JAMESTOWN colony in 1607. The “ancient companies” and the great London MERCHANTS, especially Sir Thomas Smith, who served as the company's treasurer, brought to the enterprise their experience of trading with Russia and the Levant. The Rich family, particularly Sir Robert Rich, the second earl of Warwick, aspired to realize the old dream of a PRIVATEERING base in the New World from which to strike at Spain and its treasure fleets. Many landed gentry, eventually championed by Sir Edwin Sandys, invested heavily in the company, hoping that lucrative returns would shore up their incomes, which, heavily dependent on fixed rents, were being rapidly eroded by inflation. Meanwhile, humanitarians and clergy among the founders would assist the unemployed poor who were flooding London by making them indentured servants to work the company plantation. They also aspired to make the Virginia Indians “civilized” and acquire Christian allies and customers for English-made trade goods, the demand for which would stimulate the English domestic ECONOMY. These conflicting goals and interests bred division, suspicion, and intrigue that undermined the cooperation needed to solve the immense problems of debt and insolvency entailed by the expense of sustaining the Jamestown colony until it could become profitable.

Peopling, governing, capitalizing, and making profitable the Jamestown colony was an experiment without precedent, except perhaps the failed Roanoke colony and the brutal English colonization of Celtic Ireland, models that boded ill for English-Indian relations. Unable to find a lucrative export, misruled and beset by DISEASE, unable to feed itself or to keep peace with the POWHATAN Indians, Jamestown floundered, forcing company officials down a path of repeated, but ultimately futile, reforms. The company secured a second charter in 1609 that limited royal control of its affairs, brought the colony under the control of “one able and absolute Governor,” and permitted public sale of stock. Its third charter in 1612 gave control of the financially promising Somers Isles (Bermuda) and allowed fundraising through a public lottery. Dissatisfied with the management of the London merchants, smaller stockholders in 1619 initiated another round of reform and eventually ousted treasurer Sir Thomas Smith, replacing him with Sir Edwin Sandys.

Sandys recruited more than 3,500 settlers for Virginia, many of whom were the unemployed poor forced into INDENTURED SERVITUDE. The company made land grants to private individuals in return for quitrents and established “particular plantations” farmed by TENANTS along the James River, further encroaching on Indian lands. Bowing to stockholder unease over burgeoning and exclusive TOBACCO production, Sandys encouraged the production of commodities such as iron, potash, and lumber. The

company set up a representative assembly that quickly became a means for the wealthiest colonists to control the LABOR of tenants and servants, maintain their own power, and subvert the company's will, especially its discouraging of tobacco cultivation. The failure of the reforms to produce profits and the Powhatan uprising in 1622 accelerated internal dissension among the stockholders, causing

Charles I to dissolve the company in 1624 and declare Virginia a royal colony.

## wage and price controls

Most 17th-century European states and towns instituted wage and price controls to regulate the local economy. Both the traditional concept of the “moral economy” (an economy regulated by social principles rather than market forces) and the newer theory of MERCANTILISM (the idea that the state should regulate commerce in order to foster its own power) promoted the use of such controls. Moreover, early modern Europeans generally assumed that prices and wages should remain stable over time. Colonists often quibbled over the details of wage and price controls, but both the governors and the governed favored economic regulation.

The English Statute of Artificers (1562) provided a model for colonial regulations of laborers’ hours and wages. It was often difficult to adapt statutory law to local conditions, however, so in most cases justices of the peace actually set maximum and minimum wages. The scarcity of labor in the American colonies tended to drive wages up, to the consternation of those who believed that the real value of work varied little from one place to another. Wages in the American colonies remained higher than wages for comparable work in England, but colonial courts nevertheless indicted some laborers for accepting “excessive” wages. Local officials also regulated the fees that millers, tavern keepers, ferry owners, gravediggers, and other essential community functionaries were permitted to charge.

The quintessential price control was the assize of bread, which specified the proper size, quality, and price of a loaf of bread. Local officials regulated the price of other essential goods, such as meat, leather, bricks, and nails, as they thought necessary. Shipping costs naturally drove up the price of many imported goods, but colonists were initially reluctant to make allowances for this; in the early 17th century BOSTON merchant Thomas Keayne was prosecuted for incorporating shipping costs into the price of imported nails. Indeed, colonial courts vigorously punished individuals who violated the doctrine of the moral economy.

Colonial governments also outlawed market manipulations such as “engrossing” (creating a monopoly) and “forestalling” (buying up the entire stock of a particular commodity) to drive up the costs of goods.

Local economic regulations fell into decline in the mid-18th century. A new generation of economic theorists questioned the value of commercial regulation, while an increasingly diverse and mobile population questioned the concept of a moral economy structured to promote community welfare. Nevertheless, popular support for economic regulation occasionally resurfaced in wartime or during periods of rapid inflation. In the midst of Revolutionary boycotts in 1774, the Continental Congress called on colonial governments to punish price gougers.

## Walking Purchase of 1737

In the mid-1730s the Lenape Indians (called DELAWARE by Euro-Americans) still owned much of Bucks County and the Lehigh Valley in eastern PENNSYLVANIA. As proprietors of Pennsylvania, Thomas and John Penn (the sons of WILLIAM PENN) and their agent, JAMES LOGAN, conspired to remove the Delaware from these lands. Logan argued that a copy of a deed dated 1686 proved that the Lenape had sold all lands that could be walked in a day and a half north of the previous boundary in Bucks County. Nutimus, a Delaware elder, denied that the deed included his land between Tohickon Creek and the Lehigh River. When the IROQUOIS of NEW YORK sided with the proprietors, the Delaware acquiesced.

In preparation for the “walk” James Logan directed men to clear a path so the “walkers” could move swiftly. From Wrightstown on the morning of September 19, 1737,

three young settlers, Solomon Jennings, James Yeats, and Edward Marshall, accompanied by two Delaware observers, walked north at a very rapid pace. They covered much more ground than Nutimus, Lapowinsa, and other Native leaders expected. In the afternoon, when the walkers crossed the Lehigh River, the Indian observers departed. Lapowinsa refused to send others, objecting that the Penns had “got all the best land, and they might go to the Devil for the bad.” The walkers slept overnight near Hockendauqua, Lapowinsa’s town. The Delaware refused to allow the Euro-Americans to enter the town because they were holding a religious ceremony. The walkers passed Kittatinny (or Blue) Mountain before lunch on September 20, 1737, then continued to a point near present-day Jim Thorpe. After a total of 18 hours only one man completed the entire 64 miles. James Logan drew the boundary there, extending the line northeast to the Delaware River, and set off 10 square miles near Hockendauqua for a reservation called the Indian Tract Manor.

In the 1740s and 1750s the Penns sold lands in the area of the Walking Purchase to growing numbers of European settlers. Some Natives stayed in the region, while others moved west to the Susquehanna and Ohio Valleys. In 1755 many Delaware allied with the French to push out the colonists during the SEVEN YEARS’ WAR. The British and colonists defeated the French in 1763, but not the Delaware. Conflict between NATIVE AMERICANS and settlers continued in the area through the American Revolution.

### **Walter, Thomas** (1696–1725) *composer*

Thomas Walter composed religious music in early America. Born in Roxbury, MASSACHUSETTS, the son of a minister, Thomas Walter was the grandson of INCREASE MATHER. Although his family tried to shield him from the world, Walter was precocious and earned a reputation for brilliance and conviviality. Despite early association with theological radicals, Walter was ordained in 1718 and installed as assistant pastor to his conservative father. He married Rebekah Belcher on Christmas Day, 1718, and they had one daughter.

In 1719 Walter entered a public dialogue with the theologian John Checkley, debating the order and government of the church. Walter sought to improve the quality of congregational singing at this time, compiling songbooks and preaching sermons on the importance of MUSIC in worship.

In 1721 he published his best-known hymnal, *Grounds and Rules of Musick Explained; or, an Introduction to the Art of Singing By Note, Fittest to the meanest capacity*. This text contained hymns in three parts and emphasized simple technique. Walter’s connection to the Mathers, one of the most influential families in colonial New England, meant that his work drew particular attention. This hymnal went through eight editions by 1764, and a few songs remain in use today.

Walter volunteered to be vaccinated for SMALLPOX, which Increase Mather supported. He nearly died when someone threw a bomb into the room where he lay recovering after the inoculation. Shortly afterward Walter contracted consumption and died after a lengthy and painful illness.

—Victoria C. H. Resnick

### **wampum**

Wampum, or *wampumpeag*, were manufactured strings of purple and white whelk and clam shells found in the Narragansett Bay and Long Island Sound regions of New England. ALGONQUIN Indians worked the shells by grinding and drilling them into small tubular pieces, polishing them, and stringing them together to fashion belts and rectangular matlike pieces.

Before European arrival belts and sections of wampum were sacred objects among New England Indians, denoting the power and prestige of their holders. Wampum usually adorned only SACHEMS or other prominent persons to evince rank and dignity; ordinary Natives rarely possessed or accumulated much. It was exchanged during rituals and used as payment of tribute between peoples, as dowry, and as signs of friendship and diplomatic relations. In their designs wampum belts could also mark special events or occasions, acting as a type of mnemonic or commemorative device recording local history. Wampum thus functioned as both a symbol of personal or tribal identity and as a medium in the culture of gift exchange that marked both inter- and intragroup interactions among New England peoples.

The coming of European colonists transformed the meaning and usage of wampum. Discovering its immense value among many of the peoples they encountered and realizing its potential to facilitate trade and amity with them, first Dutch and later English settlers attempted to corner its manufacture in the 17th century by establishing relations with the Mohegan, NARRAGANSETT, and PEQUOT, who controlled the coastal areas of Long Island Sound, where true wampum shells were found. These Natives obtained metal drillbits from Europeans to replace stone varieties, and wampum production grew far beyond earlier levels. Wampum began to lose much of its formal ceremonial meaning and to take on characteristics of currency. It

The Wolf Treaty belt, representing the alliance of the Mohawks with the French. The wolves symbolize the “door keepers” of the league. (*Library of Congress*)

was used to purchase goods or services. An exchange rate was computed in English money, and a market in counterfeit shells emerged. Wampum ownership became more common among ordinary Indians, and Native peoples from other regions who previously had not participated in its exchange were increasingly drawn into a nascent wampum ECONOMY. Historians have referred to the transformation of wampum shells from sacred and symbolic objects to commodities and versions of money under European influence as the “wampum revolution.”

## war and warfare

Organized violence to achieve a particular end existed in North America long before the arrival of Europeans, but the colonists introduced new motives for and methods of warfare that resulted, when combined with Native American traditions, in a blend of the two that is distinctly American. During the colonial period wars were fought between different groups of NATIVE AMERICANS, between colonists from European nations and Native Americans, and between rival colonists, although there is a good deal of overlap in these categories.

Conflicts among Native Americans along the East Coast usually did not entail a large loss of life. Instead, small groups might be killed or captured for adoption into tribes. Wars between Native Americans were transformed by the introduction of new weapons, especially firearms. The adoption of the horse by the Plains peoples transformed their ways of war, which would become a major factor as Europeans, and later white Americans, spread

west. European colonization also introduced a new motive for inter-Native American warfare—access to trade with the new arrivals.

Wars between colonists and Native Americans tended toward raids and reprisals. Europeans were frustrated by the unwillingness of their foes to stand and fight, while Native Americans were mystified by European concepts of battlefield discipline. The colonists turned to such tactics as the destruction of crops and homes when they could not bring their enemies to battle. As they were often unable or unwilling to differentiate between different groups of Native Americans, they tended to strike whatever group was handy, even if that group was friendly. Native Americans generally came from a raiding tradition of warfare that involved striking at isolated outposts and killing or capturing the entire population. Both sides tended to view the other's methods as barbaric and inhuman.

Wars were also common among colonists of rival European powers as they struggled to control the Atlantic World. A series of four major struggles between the British and French resulted in the end of French claims to mainland North America. While these wars were closely related to conflicts on the European continent, they assumed a different character. North America was ill suited to European open-field tactics. It lacked many open fields where linear tactics could be applied (the battle on the Plains of Abraham outside Quebec in 1759 is a notable exception). Despite their reluctance to adopt supposedly “barbaric” methods, colonists combined their European traditions with Native American techniques. This blending was aided by the recruiting by both England and France of substantial numbers of Native American allies. The French more often adopted their allies' tactics, while the English stuck closer to their traditions and used Native Americans as auxiliaries.

Whether involved in the great struggle for continental domination and empire or the smaller but no less violent disputes on the colonial frontier, warfare was an important part of the Native American and colonial experiences.

From these experiences came a blend of European and Native American styles of fighting—a uniquely American way of war.

**Ward, Nancy** (1738?–1824) *tribal leader, diplomat*

Nancy Ward was an influential CHEROKEE leader. Biographical details are uncertain because of the lack of written records. According to legend, she was born about 1738 at Chota in eastern Tennessee. First named Nan'yehi, she married a Cherokee warrior whom she accompanied to battles. When her husband was killed at the 1755 Battle of Taliwa, Ward seized his gun and forced the enemy to retreat. After that action she was called Ghigau, or “Beloved Woman,” the highest courtesy title given to Cherokee women. In the Cherokee's matrilineal society Ward gained power, privileges, and responsibilities, including voting rights in the General Council. She married Bryant Ward, a white trader, in the 1750s, but he abandoned her to return to his family in SOUTH CAROLINA.

Serving as an ambassador, Ward negotiated peace with white people who settled on Cherokee lands despite the royal Proclamation of 1763, which recognized NATIVE AMERICANS' land rights. Ward interceded in 1776, when she learned of Cherokee plans to raid white settlements on the Holston and Watauga Rivers, warning white people and saving a white woman captive. Ward learned to weave cloth and tend livestock, part of the transformation of GENDER roles among the Cherokee as women began to work cloth while men farmed. The first Cherokee to own cows and slaves, Ward introduced dairy husbandry to supplement their diet.

Ward protected the Cherokee's interests during peace talks with John Sevier in 1781. Four years later she negotiated on behalf of the Cherokee for the Treaty of Hopewell, the first treaty discussed with representatives of the United States. Aware that white people wanted Cherokee lands, Ward worried about the fate of her tribe. Gradually Native American women's political power waned, but Ward insisted on voicing her opinions. At the 1808 Women's Council that she led, Ward emphasized that the Cherokee should not sell more land to whites. Nine years later she advised the Cherokee to wage war to preserve their territory.

After her tribal lands were sold in 1819, Ward relocated to an inn she managed near the Ocoee River. She died in 1824, five years before women were denied voting and office rights by the Cherokee constitution and 14 years before the southern Cherokee were forcibly removed to western reservations.

**War of Jenkins' Ear** (1739–1743)

The War of Jenkins' Ear began in 1739 and involved the international ambitions of Britain and Spain. Although the fighting did not begin in earnest until 1740, the event that led to the conflict occurred nearly 10 years earlier. In 1731 Captain Juan de Leon Fandino, a Spanish naval officer, boarded a British vessel off Havana's coast. Fandino accused British captain Robert Jenkins of SMUGGLING. During the search an argument ensued, and in the heat of the altercation Fandino sliced off Jenkins's ear. Throwing the ear at Jenkins, Fandino reportedly exclaimed “Take this to your king and tell him if he were here I would do the same.”

As tensions increased between the British and Spanish in North America, Jenkins returned to London with ear in hand. Addressing Parliament, Jenkins described his altercation with the Spanish sailor and, to prove his point of Spanish savagery, produced the preserved ear. Although the Jenkins incident was one of numerous altercations along the North American frontier, his ear became a rallying cry for aggressive action. As Parliamentarians protested Spain's belligerency on the coast, further developments near FLORIDA increased tensions. When the British established GEORGIA, SLAVERY was prohibited. This prohibition was supposed to create a buffer zone between British SOUTH CAROLINA's slaves and Spanish Florida's offer of asylum to those who successfully ran away. Despite their best efforts, British planters could not stop escaped slaves from reaching freedom in Florida. FORT MOSE continued to threaten the peace in South Carolina, and in 1739 Britain declared war against Spain, supposedly for Jenkins' ear but more important because of the threat of slave unrest.

In the fall of 1739 slaves in Stono, South Carolina, revolted. For those involved the ultimate goal was passage to ST. AUGUSTINE and freedom. Fort Mose, once an abstract threat to British control, became an immediate concern for the very survival of Britain's southern colonies. Hoping to drive the Spanish from Florida, Georgia founder and general JAMES OGLETHORPE led troops on a mission to take St. Augustine in the spring of 1740. Although the

British destroyed numerous frontier outposts, including Fort Mose, they could not remove the Spanish from St. Augustine. As the British advanced the residents of St. Augustine sought protection in the city's large stone fort. While the Spaniards waited for reinforcements to arrive, Oglethorpe shelled the city. The fort, however, proved impenetrable to the British attack; the British ultimately left Florida in defeat on July 4, 1740.

—Shane Runyon

**Warren, Mary Cole** (1653–1697?) *farmer*

Mary Cole was born at the family TOBACCO farm, St. Clement's Manor, in MARYLAND to prosperous English Roman Catholic immigrants Robert and Rebecca Cole. The first daughter of five children, Mary learned to read the Bible and to sew. Like many Maryland children of the 17th century, Mary became an orphan when her mother died in 1642 and her father a year later. While many orphans suffered abuse or neglect at the hands of strangers, Mary was more fortunate in that Robert had both inventoried his possessions and chosen guardians to provide materially and spiritually for his offspring. Neighbor Luke Gardiner raised the children and sent Mary to live for a short time with her grandmother in England. Following the custom of the day, daughters received movable property from estates, and, accordingly, Mary inherited 11 cattle, a feather bed with sheets, an iron pot, an 18-gallon copper kettle, and a spice mortar when she came of age. By 1673 she had married tobacco planter and innkeeper Ignatius Warren of Newtown Hundred. Mary then disappears from the historical record. It is not known if Mary had any children, and it is believed that she died, aged about 45, before Ignatius went bankrupt.

**Weiser, Johann Conrad** (1696–1760) *German-American interpreter*

Johann Conrad Weiser helped maintain the alliance between the IROQUOIS Indians and the British. He was born November 2, 1696, in Affstätt, Württemberg, in present-day Germany. Responding to the constant warfare and destruction of their homeland and following the death of his mother, in 1710 Weiser's family heeded the advertisements of the British colonies and joined other migrants from the Palatinate to the New World. After several months

in NEW YORK CITY the Weiser family moved to upstate NEW YORK, joining other Palatines in the Schoharie Valley. When Conrad was 16, he lived in a village of Mohawk. By the end of his visit he had learned to speak Iroquoian fluently, had begun to understand Native American culture, and had developed what would become lifelong friendships. In 1729 Weiser moved from Schoharie and settled in the Tulpehocken Valley of western Berks County, PENNSYLVANIA, where he joined other German migrants and established a prosperous farm. In religious matters he was an active member of the local German Lutheran church and, during a time of personal spiritual crisis, spent time among the religious community at Ephrata. Like many other prosperous farmers and tradesmen, Weiser speculated in land after his arrival in Berks County. Through his investments he cultivated a relationship with the proprietary government that proved mutually beneficial.

His experience with NATIVE AMERICANS as a youth was advantageous for both the Pennsylvania government and the regional Indian confederacies. In 1731 Weiser accompanied Shikellamy, a chieftain of the Oneida, to PHILADELPHIA for negotiations with provincial officials, serving as translator for both parties. Over time Weiser became renowned for his skill at mediating between the agents of the Penn family and the area tribes, earning the name "Holder of the Heavens" for his services. Through his efforts the province was able to maintain peaceful relations with the Native Americans throughout much of the 18th century. On several occasions he assisted with the negotiations for land purchases, as in the notorious WALKING PURCHASE OF 1737 with the DELAWARE Indians. His diplomatic skills extended beyond Pennsylvania, as his efforts also improved Native American relations with MARYLAND and VIRGINIA. His last great act was at Easton in 1758, when he persuaded Native Americans of the Ohio Valley to sever ties with the French. By the time of his death in 1760, Weiser had also succeeded in mediating relations between German and English interests in Pennsylvania as well as among white settlers and the Native Americans.

**Wesley, John** (1703–1791) *minister*

John Wesley was born in 1703 in Epworth, Lincolnshire. The son of an Anglican rector, Wesley was educated at Christ Church College, Oxford, and was ordained as an

John Wesley (Library of Congress)

Anglican priest in 1725. While at Oxford, Wesley, together with his brother Charles and GEORGE WHITEFIELD, formed a “Holy Club” known as the Oxford Methodists to discuss spiritual issues. Although Wesley gained a reputation for piety and came to the notice of the GEORGIA trustees as a result, his time at Oxford seems only to have deepened his sense of spiritual inadequacy. However, when the trustees offered him the chance to be a missionary to the Indians while acting as the minister in SAVANNAH, Wesley accepted.

Wesley arrived in North America in February 1736 in the throes of a spiritual crisis but determined to bring a new religious discipline to Savannah. Even at this young age, Wesley’s implementation of Anglicanism was more rigorous than that of many other ministers. While his sober habits and his willingness to hold regular services in Savannah earned him the initial respect of colonists, Wesley eventually fell foul of his own stern morality. Like his brother Charles, who had taken the post as minister in Frederica farther south, John found that Georgians did not enjoy having their numerous faults and moral failings repeatedly

pointed out to them. Charles returned to England after only six months, but John remained in Georgia for nearly two years.

His strict moral code earned Wesley the animosity of Savannah’s citizenry, but his personal failings brought Wesley’s downfall in the colony. Wesley had formed an attachment to Sophia Hopkey, niece of Thomas Causton, who managed the trustees’ store and was one of the most powerful and influential men in Savannah. Many, including JAMES OGLETHORPE and Causton, believed that the pair would marry. However, when Sophia rejected a marriage proposal from Wesley and wed another man instead, Wesley reacted by singling out the newlyweds for criticism. After Sophia missed several church services, Wesley felt justified in denying her Holy Communion. The decision caused an uproar and led to a defamation suit from Sophia’s husband, John Williamson. Under this threat of court action, Wesley fled Savannah in 1737.

Despite claiming later that his time in Georgia had been a success, it is clear that Wesley failed to have a significant impact in colonial America. However, shortly after his return to London in 1738 Wesley underwent a religious conversion experience and embarked on a nationwide evangelical revival. Until his death in 1791 Wesley shaped religious revivalism in England and North America and the future of the Methodist faith.

### Westo

The Westo were a Native people of the Middle Atlantic and Southeast region during the middle and late 17th century. They played a significant role in the early stages of European colonial incursion into North America, acting both as partners to the expansionary English colony of Carolina as well as feared enemies of Spanish FLORIDA and the Native peoples within its orbit of MISSIONS and towns. The Westo are best known as allies of early English settlers of Carolina, with whom they formed a tenuous partnership in the 1670s that featured trade in firearms and English goods, Indian slaving, and mutual defense. Contemporary descriptions of them survive in reports and narratives by English colonial agents, like Dr. Henry Woodward, who spent much time among them as the representative of Carolina.

The exact identification of the Westo has caused confusion among historians because of migrations between the Chesapeake region and the Lower South as far as central GEORGIA. Their ethnohistory remains mysterious; some scholars have suggested an Iroquoian connection that places their origins in the Northeast, others a Yuchean background that implies southern roots. Because the Westo ranged across a southeastern imperial landscape contested by both Spaniards and English, European documents concerning them include incongruous mentions and conflicting information. English settlers in the Chesapeake area knew the Westo initially by the name Recohockrians, a people of the James River region with whom they had several confrontations in the 1650s. Spaniards in Florida first met the group through Native refugees fleeing the raids staged by Westo, armed with English guns, deep into the Southeast in the early 1660s. Spaniards called the Westo *chichimecos*, a term the Spanish also used in other New World settings to denote fierce and uncontrollable Indians who threatened Spanish and Native settlements.

The English in Carolina during the 1670s sought powerful Native partners to help support their fledgling colony, and the Westo, described by one correspondent as “bold and warlike,” fit their requirements. For most of that decade Westo served as the primary Native allies of Carolina, providing Englishmen with the Indian slaves, deerskins, and defensive protection that fueled that settlement’s expansion. Indeed, English officials and traders often seemed quite wary of their Westo partners, fearful that they might turn upon Carolina. Correspondents spoke of the arrangement between Westo and Carolinians in terms that belied the power of the Natives and the weakness of the colony; one admitted that “if trade were not permitted the Westos . . . they would cut all [our] throats.”

Disputes between English traders and the Westo escalated in the late 1670s, and Carolinians moved to destroy their Native partners, who now seemed less likely to submit to the colonial arrangement. The motivation for the Westo War of 1680 originated with planters and traders who dominated the Indian trade; the lords proprietors of Carolina saw the campaign from England as ill-advised and charged local leaders with putting personal gain before the welfare of the colony. Despite those objections, Carolinians along with newly allied Savannah Indians attacked the Westo. By 1683 correspondents claimed there were “not fifty Westos left alive, and those scattered,” and the Savannah had usurped the role of primary Native allies of Carolina, a station clearly as fraught with peril as opportunity.

**Wetamo** (d. 1676) *leader in King Philip’s War*

Wetamo was an influential leader whose life reflects the increasing tensions between NATIVE AMERICANS and English colonists. Born to a distinguished Native American family, Wetamo took Wamsutta, the son of the Wampanoag leader and the older brother of METACOM, for her husband. Following her husband’s mysterious 1664 death while in English custody, Wetamo became the sachem of the Wampanoag town of Pocasset, a position of authority that placed more than 300 warriors under her guidance and made her a political power in her own right. She also embarked upon a second marriage to Petanauet, the sachem of a smaller Wampanoag community. This relationship became a casualty of the split among the Native Americans when Metacom’s War erupted in 1675. Her husband cast his lot with the English, while Wetamo, who had tried to keep the peace, joined with Metacom. Because of family ties to Metacom, she had firmly opposed concessions of land and authority to the English. The war went badly for Wetamo’s side, and in the summer of 1675 she fled to the safety of the neutral NARRAGANSETT. According to New England Indian ethics, the Narragansett were obliged to honor a request for refuge, but the English interpreted Wetamo’s arrival as a hostile act and invaded Narragansett territory. Wetamo resumed fighting with her new husband, Quanopin, one of the Narragansett leaders. Together the two successfully invaded the town of Lancaster, MASSACHUSETTS. With Wetamo proving to be a formidable foe, the English sought her defeat for military reasons but also because the lands that Wetamo held would pay for the cost of the war. In 1676, with the English in hot pursuit, the newly widowed Wetamo fled through a field and tried to cross a river in the area of PLYMOUTH. She drowned. When the English discovered her body a few days later, they cut off her head and placed it on a pole at Taunton.

**Wheelock, Eleazar** (1711–1779) *missionary, educator*

A leading exponent of the GREAT AWAKENING, Wheelock trained Native American missionaries and founded DARTMOUTH COLLEGE. Born to a prosperous farm family in

Windham, CONNECTICUT, Wheelock graduated from YALE COLLEGE in 1733 and two years later settled into a pastorate at Lebanon, Connecticut. He preached widely in his home state and in neighboring MASSACHUSETTS. Interested in the conversion of NATIVE AMERICANS to Christianity, Wheelock in 1754 entered the missionary field by starting a school for Indian youths. The school would remove Native American children from what Wheelock viewed as the destructive influence of their parents, and he aimed to train the young men as missionaries to their own people. Not surprisingly, recruitment of Native Americans always proved a challenge, but Wheelock filled the seats by attracting white students. This new institution, known as Moor's Indian Charity School, was established in Lebanon, Connecticut. Because all the Native Americans were charity students and only about a third of the white scholars paid tuition, Wheelock supported his school by raising funds through various means, including targeting missionary societies of Great Britain and their American branches.

Among Wheelock's more prominent students were Samson Occom, a Mohegan, and Joseph Brant, a Mohawk. Wheelock hoped to produce students who would convert their people, but the school's record in Indian EDUCATION was mixed at best, and much of Wheelock's energy was devoted to fundraising.

Further adding to his woes, the number of Indian students dwindled steadily, with many of the students complaining that the school required more labor than studying. Wheelock eventually had to concentrate on recruiting Indian students from Canada after the IROQUOIS completely rejected his overtures and other Native Americans expressed reluctance to send their children to work with him. Occom traveled to England to raise funds but later complained that Wheelock's school resembled *Alba Mater* ("White Mother") rather than *Alma Mater*. At no time had Indians outnumbered white people at the school. In 1769 the school moved with 30 students to Hanover, NEW HAMPSHIRE and became Dartmouth College. Despite its goal of Native American education, Dartmouth produced only three Native American graduates in the 18th century.

—Caryn E. Neumann

### **Wheelwright, John** (1592?–1679) *minister*

The founder of Exeter, NEW HAMPSHIRE, John Wheelwright was a minister who became involved in religious controversy in early MASSACHUSETTS. He was born in Lincolnshire, England, the son of Robert Wheelwright and Katherine Mawer. A large landowner, Robert Wheelwright had the

means not only to send his son to Sidney Sussex College, Cambridge, but also to leave him a substantial estate. After receiving a B.A. in 1615 and an M.A. in 1618, Wheelwright was ordained a priest and became vicar at Bilsby. A critic of the Church of England, Wheelwright lost his Bilsby living in 1632. Following the death of his first wife, Marie Storre, Wheelwright married Mary Hutchinson, a union that eventually led to an alliance with his new sister-in-law, ANNE MARBURY HUTCHINSON.

In 1636 Wheelwright and his family joined the Puritan migration to Massachusetts, where he quickly became involved in the controversy surrounding his sister-in-law. Anne Hutchinson accused the clergy of the colony, except JOHN COTTON and Wheelwright, of preaching a covenant of works. Hutchinson and her supporters promoted the appointment of her brother-in-law as a minister for the congregation in BOSTON. After a powerful minority in the congregation, led by former governor JOHN WINTHROP, blocked the appointment, Wheelwright accepted a position in Mount Wollaston.

Wheelwright, however, could not steer clear of controversy. He accepted an opportunity to give a Fast Day sermon in Boston in early 1637. Wheelwright outraged many when he argued, as had Anne Hutchinson, that too many church members knew Christ only through the good works they performed rather than acknowledging that justification came through faith alone. The province's General Court found Wheelwright guilty of sedition and banished him to New Hampshire shortly before they likewise banished his sister-in-law.

In 1644, after receiving conciliatory letters from Wheelwright, the General Court lifted his banishment. In the mid-1650s he sailed to England but returned to Massachusetts shortly after the restoration of Charles II. He became pastor at a church in Salisbury and died there in 1679. Wheelwright remains a significant figure largely because of his alliance with Anne Hutchinson, an accomplished woman who challenged a patriarchal culture.

### **White, Andrew** (1579–1656) *missionary*

Known as the "Apostle of Maryland," Andrew White was a missionary to Indians and often involved in religious controversy. Born in England, he studied in France and took vows there as a Roman Catholic priest in 1605. He returned to England, where priests were prosecuted following the Gunpowder Plot. Banished, White fled to Belgium, where he became a Jesuit. He returned to London in 1612, then alternated between missionary

work in that city and teaching positions on the European continent for 21 years.

In 1633 White wrote a promotional tract encouraging settlers to move to MARYLAND; he also wrote a version in Latin for the Jesuit leaders. Cecil Calvert approved both the terms that White offered to would-be settlers and his glowing descriptions of the land. In November 1633 White and two other JESUITS accompanied the first Maryland colonists. He wrote several widely circulated accounts of the voyage, EXPLORATION, and settlement, in Latin and English, describing the local vegetation and geography, using wry humor, and including information on the Indians of the area. White devoted much of his time as a missionary to Indians and to learning their languages. In 1640 he baptized Chief Chitomachon of the Canoy, along with several other important members of the tribe. Accounts of this episode appeared throughout Jesuit LITERATURE and inspired other priests to go as missionaries to the New World.

During political struggles in Maryland White was captured and sent in chains to England on charges of being a Roman Catholic priest. Acquitted because he had been forced to return to England, he fled to Belgium and started a never-completed history of Maryland. After his 1650 return to England White repeatedly requested to be allowed to visit Maryland but was refused; he died in England.

—Victoria C. H. Resnick

George Whitefield (Library of Congress)

### **Whitefield, George** (1714–1770) *evangelist*

George Whitefield was the itinerant evangelist whose preaching spread the religious revival known as the GREAT AWAKENING throughout British America. From his native Britain he made several voyages to North America, preaching to open-air crowds from MASSACHUSETTS to GEORGIA to proclaim a message of spiritual rebirth and personal salvation.

Born in Gloucester, England, Whitefield attended Pembroke College, Oxford. There he met Charles and JOHN WESLEY and joined the “Holy Club,” a group of men who followed John Wesley’s method of focused scriptural study and prayer. One evening as he studied, he suddenly felt an overwhelming sense of God’s presence, pardon, and love—a spiritual rebirth. This experience transformed his religious life and became the central core of his preaching. His description of this conversion, *A Short Account of God’s Dealings with the Reverend Mr. George Whitefield* (Philadelphia, 1740), was widely sold in Britain and America.

Whitefield was ordained a deacon in the Church of England in 1736, and two years later he followed the Wesley brothers to Georgia. Although they had left by the time that Whitefield arrived, he became active in the new colony, preaching and starting schools in SAVANNAH and outlying settlements. After four months Whitefield

returned to England to raise funds to establish an orphanage in Georgia.

On January 14, 1739, Bishop Martin Benson ordained Whitefield an Anglican priest. However, his evangelistic emphasis on spiritual rebirth and his collecting money for personal causes angered the established clergy, and Church of England pulpits generally were closed to him. He preached in public halls and outdoors, with crowds growing as his oratorical fame spread.

Returning to North America in 1739 with funds and supplies for the Georgia orphanage, he spent most of this visit as an itinerant evangelist, preaching at stops from PHILADELPHIA southward along the East Coast. Arriving in Georgia in January 1740, he opened the orphanage (Bethesda) and settled many orphans there, although angering some people by wresting the children from families already pledged to care for them. In CHARLESTON Whitefield became involved in a preaching duel with the Church of England commissary, Reverend Alexander Garden. Both men’s attacks were subsequently published, adding to the enmity between Anglicans and Whitefield.

The remainder of his life followed a similar pattern. He made six more visits to North America, generally collecting

funds for the orphanage and visiting the major urban centers from BOSTON to Savannah. Often he traveled on horseback, preaching daily to crowds gathered in open fields. His eloquent voice and uncanny ability to speak to the needs of his audience inspired and enthused the crowds. He was clear about his own mission: He had come to plant; others would water and reap the harvest. Skillfully using advertising techniques, he provided newspapers with his itinerary and articles on his preaching campaigns in Britain. He steadily produced printed works and corresponded with a network of evangelical clergymen, sending them notices of his latest publications and sermons. Even opposition from major church leaders expanded into pamphlets that attracted notoriety.

His message was consistent. God was spreading across the Atlantic world a “GREAT AWAKENING” to the power of spiritual rebirth. Diligent biblical study was the means by which individuals might appropriate that new birth for themselves; its reality would become evident in amended lives. In this he remained theologically a Calvinist, stressing that though no one had the certainty of God’s “election” (salvation), the proclamation of God’s love should be made available to all.

Recent scholars stress the importance of Whitefield’s work in enabling revolutionary discourse. His travels throughout the colonies and his refusal to be identified with a particular church or sect provided a unifying vocabulary. The effectiveness of his preaching in arousing individual action inspired a later generation of patriot orators. His message of individual empowerment and his castigation of religious leaders who had abandoned their ecclesiastical responsibilities gave courage to common people who would later hold governors, even the king himself, accountable for their misdeeds.

Whitefield’s oratorical skills were stunning. Benjamin Franklin, a religious skeptic, relates how he was inspired by Whitefield’s sermons. Although initially resolving not to make a donation when the collection plate was passed, Franklin was so impressed during the course of the sermon that he emptied his pocket into the plate.

Whitefield died in Newburyport, Massachusetts, in the midst of a revival journey through New England. His collected works were published after his death.

**Wigglesworth, Edward** (1693–1765) *minister, writer*  
Edward Wigglesworth was born in Malden, MASSACHUSETTS, the son of MICHAEL WIGGLESWORTH, a Puritan

minister and author of the popular 1662 poems *The Day of Doom* and *Sybel Sparhawk*. He was educated at Boston Latin School and HARVARD COLLEGE, graduating from the latter in 1710. After a decade of preaching at several churches and teaching at Boston Latin School, Wigglesworth became Harvard’s first Hollis Professor of Divinity in 1721. Nine years later he received a doctorate in divinity from Edinburgh University in Scotland. Following the death of his first wife, Sarah Leverett, he married Rebecca Coolidge. The couple had four children.

Wigglesworth remained at Harvard for the rest of his life, twice declining the rectorship of YALE COLLEGE. Despite increasing deafness, he had a distinguished career as an educator and theologian. He also served several years as a commissioner for London’s Society for Propagating the Gospel among Indians. The mid-18th-century evangelical movement known as the GREAT AWAKENING posed a particular challenge to “Old Light” theologians like Wigglesworth. Intensely critical of itinerant ministers like the famed Englishmen GEORGE WHITEFIELD, Wigglesworth charged that such men caused considerable religious disorder with their emphasis upon emotion and enthusiasm, views he published in *A Letter to the Reverend Mr. George Whitefield* (1745).

Although he railed against the “New Light” ministers, Wigglesworth was willing to reconsider his own religious views, and an examination of his published sermons and pamphlets reveals a shift away from predestination, the notion that God arbitrarily determined one’s salvation. Over time he began to embrace Arminian beliefs, acknowledging the free will of individuals and the importance of good works in assuring salvation. This is most evident in a work he published very late in life, *The Doctrine of Reprobation* (1763). Wigglesworth was also involved in an important public policy debate. In 1720 he published a number of letters in opposition to a proposed land bank scheme to improve farmers’ access to credit, a proposal Wigglesworth believed would lead to crippling indebtedness. Despite his opposition, Massachusetts instituted a land bank two decades later. Still, Wigglesworth’s was an important voice in the religious and secular controversies in 18th-century Massachusetts.

—Larry Gragg

**Wigglesworth, Michael** (1631–1705) *poet*

Michael Wigglesworth was a popular religious poet who warned the PURITANS to follow their God. Born in England, he immigrated with his family in 1638, settling in New Haven, CONNECTICUT. CHILDHOOD illness left him

physically unwell for the rest of his life. Wigglesworth was educated at HARVARD COLLEGE and taught there briefly.

In 1654 he moved to Malden, MASSACHUSETTS, to serve as minister. He preached there for several years without being ordained. Wigglesworth's diary from this time describes his confusion, illnesses, sexual desires, and doubts about his calling. Marriage to a cousin, Mary Reyner, in 1656 and the birth of a daughter helped ease his mind, as did living with his mother and sister. At last ordained in 1657, ill health frequently necessitated the hiring of substitute preachers.

The 1659 death of his wife and troubles with his parish in 1661 led Wigglesworth to write "The Day of Doom." This lengthy poem vividly describes the horrors of Judgment Day for the community according to Puritan doctrine, using familiar scriptural passages and millennial fears. Written in common meter and using an internal rhyme scheme, it is easy to memorize, as many did; for more than a century, "The Day of Doom" was the most popular poem in New England.

Profits from this work permitted Wigglesworth to visit Bermuda, where he studied medicine and attempted to regain his health. He returned to Malden a year later to find that his congregation had hired a replacement, so he became the town doctor. Wigglesworth continued writing; his best known work from this period, "Meat Out of the Eater" (1669), emphasizes the instruction of individual souls, arguing that affliction is a purifying experience.

In 1679 Wigglesworth scandalized Malden by marrying his much younger housekeeper and subsequently fathering six children; he married a third time in 1791. His health and spirits improved, and in 1686 Wigglesworth returned to the pulpit, remaining there until his death.

**Willard, Samuel** (1640–1707) *minister, essayist, theologian*

Part of the second generation of New England PURITANS, Samuel Willard promoted and defended orthodoxy in an era of change. Born in Concord, MASSACHUSETTS, to Simon and Mary Willard, Samuel entered HARVARD COLLEGE in 1655. In 1663 he began preaching at Groton. A year later Samuel wed Abigail Sherman, who bore him six children. Widowed in 1676, Willard married Eunice Tyng in 1679 and fathered 14 more children. When Groton was destroyed in 1675 during KING PHILIP'S WAR, Willard moved to BOSTON and soon joined the South Church. After a brief span as copastor, Willard became a full minister in the church in 1678.

A conservative, Willard championed the New England theocracy and did much to obstruct the inroads of BAPTISTS and QUAKERS. He saw Antinomianism as a distortion of the essential elements of Christianity, such as revelation, and in his preachings he sought to preserve the balance of divine sovereignty and human responsibility. His major concern was to devise a system by which checks and balances would preserve the cause of orthodoxy. To protect the faith, Willard tried to halt the excesses of the 1692 Salem witch trials by urging caution in the accusing individuals and by arguing that greater evidence than suspected WITCHCRAFT was needed for prosecutions. Unable to stop the hysteria at Salem, Willard sought to atone for the hangings by arranging a day of humiliation. A prolific author, he produced 50 works, including *Covenant Keeping* (1682), an exploration of the key elements of Puritanism, *Heavenly Merchandise* (1686), an examination of the meaning of truth, and *A Compleat Book of Divinity* (1726), a full statement of the Puritan synthesis. Always interested in strengthening orthodoxy, Willard helped secure a charter for Harvard College that would protect the interests of Puritanism. In 1701 he became the president of the college. Shortly before his death Willard prepared a number of sermons on the sacraments that elaborated upon traditional views. Among other points, he argued that the second commandment established the ministry, and therefore public maintenance of the church (opposed by Quakers) was not a human choice but a divine order.

**Williams, Roger** (1603?–1683) *founder of Rhode Island*

The founder of the RHODE ISLAND colony, Roger Williams was an advocate for the cause of religious liberty in colonial New England. Likely born in 1603, Williams spent the majority of his life embroiled in controversy and exile. After graduating from Pembroke College of Cambridge University (1627), Williams accepted an Anglican post as the private chaplain of William Masham. During his tenure in this position, Williams aligned with the Puritan efforts to reform the Church of England. With the threat of persecution looming for such dissenters and nonconformists, Williams followed his friend JOHN WINTHROP to the New World, landing at Nantasket, MASSACHUSETTS, on February 5, 1631. Initially excited about the arrival of the young minister, the Massachusetts Bay Colony soon lost interest in Williams due to his tendencies toward separatism—a movement of strict CONGREGATIONALISTS

Exiled by the Massachusetts Bay Colony for his radical religious views, Roger Williams found asylum among the Narragansett Indians in what became the colony of Rhode Island. Shown is *Roger Williams and the Narragansett Indians*, a 19th-century engraving by J. C. Armytage and A. H. Wray. (Library of Congress)

who questioned the piety of the established New England churches. Convinced of the illegitimacy of an established church, Williams entered a polemical war with JOHN COTTON over the issue of religious liberty. This controversy culminated in Williams's banishment from Massachusetts Bay on October 9, 1635.

After a difficult winter in the New England wilderness, Williams entered an agreement with the NARRAGANSETT to occupy a tract of land at the headwaters of Narragansett Bay. With the aid of Native American allies, Williams established the settlement of Providence, which soon became a haven for other exiles, such as ANNE MARBURY HUTCHINSON and SAMUEL GORTON. Shortly after settling at Providence, Williams assisted in founding the first Baptist church in North America (1638). Even though his adherence to the Baptist faith ended in 1639, his affiliation

with Baptist principles fostered his friendship and cooperation with John Clarke, who founded a Baptist congregation at NEWPORT, Rhode Island. Hoping to secure the right to freedom of worship, Williams returned to England in 1643 to seek a charter for his fledgling colony. After a brief yet intense struggle, Williams successfully petitioned for a royal charter in March 1644 (although it was not officially signed until 1663).

With the colony's charter granted, Williams again turned his attention toward the dangers of established religion. His *Queries of Highest Consideration* (1644) addressed the hesitancy of other dissenters toward religious liberty. Williams followed this collection of 12 questions with *The Bloody Tenent of Persecution, for Cause of Conscience* (1644), which was received with much criticism, including public burning in London. These volumes,

along with *The Bloudy Tenent Yet More Bloudy: By Mr Cottons Endeavor to Wash it White in the Blood of the Lambe* (1652) and *The Examiner Defended* (1652), relate Williams's arguments against the establishment of religion and for religious liberty.

In addition to striving for religious freedom, Williams labored on behalf of NATIVE AMERICANS both politically and religiously. In the political realm he questioned the right of the Europeans to seize Indian lands. When the Massachusetts Bay Colony banished Williams, he turned to his Native American allies, in particular the Narragansett chiefs CANONICUS and MIANTONOMO, for land. Not only did Williams believe the Native Americans owned North America, he also supported their right to worship as they pleased, as evidenced in *Christenings Make Not Christians* (1645), in which he argues against forced conversions. His interaction with Native Americans prompted Williams to publish *A Key into the Language of America* (1643). Largely due to the influence of this volume, Williams often served, albeit not always successfully, as a mediator between the colonists and the various tribes.

—Richard A. Bailey

**Wingina (Pemisapan)** (d. 1586) *Roanoke sachem*

Wingina was an ALGONQUIN overlord of the Albemarle and Pamlico Sound (NORTH CAROLINA) area during Raleigh's first two expeditions to establish the first English colony in America. Ruling the Roanoke Algonquin from his principal town, Dasamonquepeuc, on the mainland immediately across the sound from the Roanoke Island colony, Wingina was informally allied through kinship with the werowances of the neighboring Weapemeoc and Choanoke tribes. Wingina ruled Roanoke Island itself through his brother, the werowance Granganimeo, who hospitably greeted and feasted Philip Amadas and Arthur Barlowe, the two MARINERS dispatched by Raleigh in 1584 to reconnoiter sites for his proposed colony. When Richard Grenville's expedition arrived to establish a colony in 1584 (see Volume I), Wingina immediately directed his people to plant crops and set fish weirs for the English in return for their trade goods. From these first friendly encounters, the English mistakenly concluded that the Indians would, in Thomas Harriot's words, come to "honour, obey, feare, and love" them.

His "love" of English trade goods and "fear" of their seemingly supernatural powers shaped Wingina's initial friendly but cautious policy toward the English. His proximity to the Roanoke colony allowed Wingina to become

the intermediary for coveted English goods, which he funneled into the already existent intertribal trade networks, thereby enhancing his influence over neighboring tribes. The absence of women and children among the English and the spreading devastation of European DISEASE induced a fearful belief in Wingina—who himself became "so grievously sick that he was like to die"—that the English had risen from the dead and could kill people from a great distance with invisible bullets. Fear quickly overcame love.

Grenville's burning of the Secotan town of Aquascogok in retaliation for the theft of a silver cup and Ralph Lane's armed extortion of scarce POWHATAN foodstuffs throughout the winter of 1585–86 convinced Wingina that the English meant to deal with his people in a violent, military manner. After the deaths of Granganimeo and his "savage father" Esenore in April 1586 silenced the most powerful pro-English voices on Wingina's council, Wingina signaled a new policy of resistance by changing his name to Pemisapan. The Roanoke and the neighboring tribes withdrew from the English, broke their fish weirs, refused to plant corn for them, and eventually formulated a plot to kill Ralph Lane and the colonists. Raiding Esenore's memorial service, Lane took Skiko, the Secotan werowance's son, hostage. When Skiko eventually revealed the details of Wingina's plot, Lane and 25 armed Englishmen raided Dasemunkepeuc. Wounded in the ensuing fight, Wingina escaped. Lane's Irish servant boy pursued the werowance into the forest, emerging shortly thereafter "with Pemisapan's head in his hand." The murder of Wingina left the Roanoke temporarily leaderless but implacably hostile to the English.

—James Bruggeman

**Winthrop, John** (1588–1649) *colonial governor, diarist, religious leader*

No other single figure is so completely identified with the Puritan movement that founded the MASSACHUSETTS Bay colony as is John Winthrop. A firm believer in the godly commonwealth of "visible saints," Winthrop was the leading figure in Massachusetts for 19 years. His history of the colony, written in the form of annals, provides a closely detailed account of the first two decades.

John Winthrop was the son of Adam Winthrop, a lawyer and the lord of the manor of Groton, and his second wife, Anne Browne, the daughter of a trader. Winthrop attended Trinity College, Cambridge, but left without taking a degree. He then became an attorney himself, being admitted to both Gray's Inn (1613) and the Inner Temple

(1628), received the lordship of the manor of Groton from his father (1619), and was appointed an attorney for the Court of Wards and Liveries in London (1626). Winthrop had become a devout Puritan while still at Cambridge, and suffered along with other PURITANS in England during the restrictive era of Archbishop Laud. Winthrop decided to emigrate with his family to New England when Charles I granted a charter incorporating the governor and company of the Massachusetts Bay, and he was quickly drawn into a leadership position.

Winthrop's Puritan ideology was stated clearly in "A Model of Christian Charity," a secular sermon he delivered aboard the *Arbella*, flagship of the first fleet of Puritan immigrants in 1630. "We shall be as a city upon a hill," he warned his fellow emigrants, so that if they should fail to build their new Jerusalem properly, the entire world would see their disgrace. Winthrop helped to establish BOSTON in September of 1630 as the capital of a Puritan commonwealth. Winthrop, like most other English settlers, argued that the Puritans of Massachusetts had a legal right to the land despite the Native American inhabitants. It was, to English thinking, a vacant land "which we took peaceably, built a house upon it, and so it hath continued in our peaceable possession ever since," land the settlers had "taken and possessed as *vacuum domicilium* [which] gives us a sufficient title against all men."

John Winthrop (Library of Congress)

Far from wanting a democracy for Massachusetts, Winthrop attempted to transfer the English concept of CLASS to the colony. He reluctantly gave in to the pressure from the freemen of the colony to have more control of and say in the government. Political dissensions arose between Winthrop and his rival, THOMAS DUDLEY, in 1636, the same time that the Antinomian crisis of ANNE MARBURY HUTCHINSON threatened the colony. Winthrop proved successful in defending the colony's actions against her, denouncing Hutchinson, whom he called "a woman of ready wit and bold spirit." Hutchinson and her followers were banished despite the support of Governor Henry Vane and Reverend JOHN COTTON. At the same time as the Hutchinson controversy, Winthrop was accused of being too lenient with ROGER WILLIAMS; Winthrop was suspected of harboring and assisting Williams both before and after his exile from the Bay Colony.

In the same year that the Massachusetts General Court divided itself into two houses of deputies and magistrates in 1643, Winthrop finally saw realized his goal of a protective league among the New England colonies of Massachusetts, PLYMOUTH, CONNECTICUT, and New Haven, with the notable exception of RHODE ISLAND. Winthrop, however, still followed an individual course when he privately assisted the French Acadian official La Tour against his rival D'Aulnay, despite the protests of the confederation commissioners. Winthrop was singled out for impeachment in 1645 as an example of the magistrates attempting to take too much power away from the freemen. He was acquitted and delivered a secular sermon on the acceptance of liberty as instituted by God.

Winthrop was a sometimes vain and arrogant Puritan, often at odds with those around him and deeply stung by any criticism of his actions, but he was aware of these faults and communicated them through his journal and published writings. Winthrop was also the foremost defender of Massachusetts against all perceived foes, whether other religious adherents, Crown officials, or NATIVE AMERICANS. He thought the colony should be spiritually and secularly combined in a "Godly" Puritan commonwealth.

—Stephen C. O'Neill

**Wistar, Caspar** (1696–1752) *businessperson*

Caspar Wistar (Hans Caspar Wüster) became a colonial leader and glass manufacturer. He was born in February

1696 in Waldhilsbach, a small village in the Palatinate, in present-day Germany. The first-born son of a forester or hunter, Wistar received little formal EDUCATION. Instead, he worked for his father, hunting and fowling, until he was 17, when he began a four-year hunting apprenticeship. In 1717 the “Lord of all Lords inspired” Wistar to TRAVEL to PENNSYLVANIA.

Wistar was one of 100,000 German-speaking immigrants who arrived in British North America during the 18th century. Unlike many of these immigrants, he avoided INDENTURED SERVITUDE because he could pay for most of his transportation costs. On his arrival Wistar worked briefly for a soap maker and then apprenticed as a brass button maker. Four years after his voyage he purchased a prime city lot in PHILADELPHIA and set up shop as a brazier and a merchant. In addition to buttons, he sold dry goods, hardware, made-to-order long rifles, and German-language LITERATURE. In 1726, after joining the Society of Friends (QUAKERS), Wistar married Catherine Jansen, the daughter of prominent Quakers in Germantown. By the early 1730s he was speculating in backcountry land. In the process he provided credit to his fellow German-speaking immigrants squatting on the land, aided the Penn family in clearing land titles, and earned tremendous profits. In 1738, relying on knowledge from his forestry background and skilled European glassblowers, Wistar established the United Glass Company in Salem County, New Jersey, the business for which he is best known. In each of his enterprises Wistar succeeded by creatively adapting his European knowledge to his American circumstances. He also made shrewd use of his ethnic identity to craft a position as mediator between GERMAN IMMIGRANTS and their Anglo-American neighbors. When he died in 1752, Wistar, who still considered himself primarily a brass button maker, left his widow and his six adult children a large estate valued at 26,000 Pennsylvania pounds.

## witchcraft

The widespread belief in witches and witchcraft was transported to the colonies from Europe. Colonists, especially in MASSACHUSETTS and CONNECTICUT, believed in a very real devil and very real witches. It was common belief that some women and men signed the devil’s book, thereby gaining power over their neighbors through sorcery. Many colonial communities had a “wise” woman or man, someone who had a store of folk knowledge and traditional

MEDICINE, and these people often faced the possibility of persecution. Single women were particularly vulnerable to accusations of witchcraft, in part because they lacked much power and in part because some widows had inherited land and wealth from their husbands, placing them in an unusual situation in 17th-century New England.

Suspected witches in Europe were executed on a vast scale in both Protestant and Catholic countries. The English colonies in America copied Europe, but on a much smaller, more personal scale. Many authorities, particularly the PURITANS, took the Biblical command “Thou shall not suffer a witch to live” literally. The New England colonies witnessed 57 trials for witchcraft between 1647 and 1691, although only a few cases were tried in NEW YORK and VIRGINIA. Witchcraft cases began to occur sporadically in the colonies during the 1640s. The handful of accusations, indictments, and trials for witchcraft in Virginia and New York resulted in only one conviction, in 1655. The convicted Virginia warlock (male witch) was sentenced to 10 lashes and banishment. Authorities in Connecticut and Massachusetts, however, were more zealous, executing at least 14 people found guilty of witchcraft. The cases of witchcraft before 1692 were usually characterized by reasonably fair legal proceedings and a skeptical attitude. Even in the New England colonies, more than 70 percent of those brought to trial for witchcraft were acquitted. Trials in New England for offenses other than witchcraft usually ended in acquittal only 10 percent of the time.

The “supernatural” element of witchcraft cases made them popular topics for gossip and publishing. One particular case in BOSTON, that of the widow Glover (a Gaelic-speaking Irish Catholic) who was executed in 1688, attracted the attention of the Puritan reverend COTTON MATHER. He published a detailed account of the case, complete with descriptions of the symptoms of possession, the following year in his *Memorable Providences Relating to Witchcraft and Possessions*. He warned the people of Massachusetts of the threat of a witchcraft epidemic as punishment for running away from their former religious conviction. Mather’s prediction soon came true.

The outbreak of the infamous witchcraft hysteria in Salem Village, Massachusetts, began in January 1692. A group of local girls gathered in the home of Reverend SAMUEL PARRIS, the minister of the parish. They listened to stories told by TITUBA, a slave of the Parris household who arrived in the colonies from Barbados. The girls joined Tituba in rituals, then, fearful of being caught after acting possessed, accused Tituba of being a witch. Tituba in turn accused two other women of being witches. Events spiraled out of control as various factors, long-standing feuds, jealousies, and family rivalries made the situation more serious. The group of girls, the “afflicted children,” began

This 1876 engraving depicts a Salem witchcraft trial. (*Library of Congress*)

accusing dozens of people, until finally more than 200 were arrested and jailed on charges of witchcraft.

Governor Sir William Phips, arriving home in Boston with Reverend INCREASE MATHER (Cotton's father) and the second Massachusetts charter in May, commissioned a special Court of Oyer and Terminer, hoping to put an end to the hysteria. The court began to try several of the accused witches, relying heavily on eyewitness testimony and "spectral evidence," which manifested its presence in the fits of screaming and frenzied behavior of the girls. The court initially found all accused witches guilty and convinced many to confess to escape the gallows by identifying other witches. Most who maintained their innocence were convicted and sentenced to death.

Indictments during the hysteria ranged from a few social outcasts to prominent and wealthy colonists, including MERCHANTS and even a minister. Seventy-five percent of those accused of witchcraft were married or widowed women between the ages of 40 and 60 years old, while most of the accusers were single adolescent girls between 11 and 20. Fourteen women and five men were convicted and executed by hanging. One older man, Giles Corey, was pressed to death by stones for not entering a plea of guilty

or not guilty at his trial; his final words reportedly were "more weight." One man and three women died in jail.

Legal proceedings against 156 people from 24 towns had been initiated by the end of September. Several leading ministers, notably Increase Mather, began to doubt the legality of the proceedings in Salem, especially the use of the spectral evidence. Governor Phips, whose wife was among the accused, suspended the proceedings and dismissed the court. General pardons were soon issued. When the newly created Massachusetts Superior Court of Judicature (with many of the Salem court's judges) convened in January, spectral evidence was not admitted. The remaining cases were quickly acquitted and the hysteria subsided. Many jurors publicly apologized for their verdicts four years later, and in 1714 the Massachusetts legislature officially exonerated the victims.

The Salem witchcraft hysteria was the final and largest outbreak of witchcraft in the colonies. Isolated accusations would occasionally appear afterwards, in Virginia in 1706 and in PHILADELPHIA as late as 1787 (where one woman was killed), but nothing came close to the scale or the religious intensity that surrounded the Salem trials. By the mid-18th century, prominent colonists like Benjamin

Franklin made open fun of accusations of witchcraft. Skepticism marked legal proceedings against witches after 1692. The lessons of Salem had apparently been learned.

### **Wolfe, James** (1727–1759) *soldier*

James Wolfe was the British general who captured Louisbourg and Quebec during the SEVEN YEARS' WAR, thereby helping to ensure a British victory in that conflict. Wolfe was born in Westerham, England, the elder son of General Edward Wolfe. At the age of 14, James joined the British army, in which he served with honor during the War of the Austrian Succession (1740–48) and against the Scottish pretender to the throne, Charles Edward Stuart, in 1746. Early in the Seven Years' War Wolfe was serving as a brigadier general under Major General Jeffrey Amherst when he captured the French fort at Louisbourg, Nova Scotia, in July 1758. In failing health Wolfe returned to England, where the British political leader William Pitt promoted him to the rank of major general and returned him to Canada to lead the expedition against the French at Quebec. In June 1759 Wolfe led about 9,000 troops up the St. Lawrence River and camped on the river island of Orleans, across from Quebec. Built on a high bluff overlooking the river, the city was easy to defend. General Marquis de Montcalm, the French commander, kept his troops inside the fortress city. As a result Wolfe ordered a frontal assault east of the city on July 31, but the French repelled it. For more than a month the British siege of Quebec lingered. Finally, on September 12, Wolfe surprised Montcalm by secretly moving 5,000 soldiers up the river and onto the Plains of Abraham west of the city. Montcalm realized that he must either face the British in an open battle outside the city or be cut off by land and river. The next day the British defeated the French, and the city surrendered a few days later. However, Wolfe died of a third wound suffered in the battle, his career cut short at the age of 32. This victory essentially won the war for the British in North America, although Montreal did not fall for another year. The Treaty of Paris officially ended the war in 1763.

### **wolves**

"The wolves in Carolina are very numerous, and more destructive than [other] animal[s]," wrote naturalist MARK CATESBY in 1743. "They go in droves by night, and hunt deer like hounds, with dismal yelling cries." This was the ALGONQUIN park wolf, *Canis lupus lycaon* (sometimes called the eastern wolf and thought by many modern taxonomists to be related to the red wolf), a canid that once inhabited the broadest range of any North American subspecies. When the first Europeans arrived the range of the Algonquin wolf stretched from Hudson Bay south along the eastern seaboard to FLORIDA and west as far as eastern Minnesota, where it likely intermixed with another subspecies, the Minnesota wolf (*Canis lupus nubilus*). Today the Algonquin wolf remains confined to parts of Ontario, Quebec, and possibly northern Minnesota (although taxonomists debate the status of these wolves). Morphological and physiological measurements of extant skull specimens from the eastern seaboard demonstrate that it, like the red wolf, was smaller than most other North American subspecies.

With its "dismal yelling cries" echoing in the North American wilderness, the very wilderness that European colonists sought to transform into cultivated farmland, it should not be surprising that these settlers had essentially exterminated the wolf in the East by the 19th century. In England, homeland of many colonists, wolves had been hunted to extinction nearly a century earlier, during the reign of Henry VII (1485–1509). In Scotland wolves survived until 1743, while in Ireland populations of the animal lasted until the 1770s. In North America part of the motivation for exterminating wolves was economic. In 1610 VIRGINIA colonists brought cattle from the West Indies, while other settlers raised sheep. Legislation against killing livestock in the early years sought to ensure that the ANIMALS proliferated, but "sheep for a few years suffered greatly from the ravages of wolves," wrote one observer, and stock never reached anticipated numbers. A 1638 letter by colonist Edmund Browne succinctly explained, "Our greatest enemies are our wolves."

Colonists reacted swiftly and relentlessly against "marauding companies" of wolves. MASSACHUSETTS Bay Colony, for example, offered bounties to colonists for dead wolves throughout the 1630s and 1640s; in exchange for a severed wolf head (which constables later buried after cutting off its ears and tongue), NATIVE AMERICANS received corn and wine. In May 1645 Massachusetts Bay colonists formed a committee to "consider . . . the best ways and means to destroy the wolves which are such ravenous cruel creatures." Three years later BOSTON bought dogs "for the destruction of wolves." Similar legislation appeared in the New PLYMOUTH and Virginia colonies, where Native Americans brought in wolf heads as tribute to their new

colonial masters. In 1640 RHODE ISLAND witnessed the birth of professional wolf hunters whom they paid “thirty shillings a head for every one killed.” ROGER WILLIAMS led a “grand hunt” to “extirpate” the wolves of Rhode Island, but he met with limited success as wolves “continued to be a source of annoyance.”

The threat of wolves in North America was more than economic, however. Eighteenth-century theologian COTTON MATHER preached to colonists that they needed to turn America’s “howling wilderness” into a “fruitful field.” Similarly, in 1756 John Adams wrote that once the “whole [North American] continent [had been] one of continued dismal wilderness, the haunt of wolves and bears and more savage men,” but after the tilling and killing of this wilderness it had been made the “magnificent habitations of rational and civilized people.” Religious Pilgrims to the New World often viewed the wilderness as a place without God, and wolves, symbolic of such wilderness, were targeted as animals that needed to be extirpated. In this sense, wolf killing should be understood as part of the “errand into the wilderness.” This need to extirpate wolves, moreover, later became part of the migration of white settlers into the American West, where they hunted wolves to near extinction.

### women's status and rights

The status of women in the British North American colonies varied significantly according to the ethnic group and CLASS to which they belonged. Religion, region, and maturity of the colonial settlement also had an impact on women’s lives.

Within European settlements English law, custom, and religion established distinct yet flexible boundaries between the roles of women and men. Men were dominant in politics and society as well as within families; they were responsible for the financial support and protection of their wives and children. Women had a constricted public role, and within the household they contributed unpaid LABOR and promised obedience to their husbands.

The GENDER ideology of early modern England contained the contradictory constructs of women’s inferiority, on the one hand, and capability, on the other. The English, like other Europeans, believed that men and women had different natures, with males assuming central, dominant, and positive characteristics and females portrayed with marginal, subordinate, and negative traits. Europeans believed that women were intellectually and morally infe-

rior to men, less able to control their passions, and more likely (as in the case of Eve) to make compacts with Satan. While females were weaker physically and mentally, their openness to the devil’s deception gave them powers that men feared and sought to control.

English common law contained both the means of subordinating women and recognition of their potential strength. Under the concept of unity of person, a woman and a man became a single entity upon marriage. The husband received legal authority to act for both—to sell, buy, transfer, and bequeath property, control earnings, sue and be sued, make contracts, and act as guardian of the children. The wife, as a married woman, held the legal status called *feme covert*; she could take none of these actions independent of her husband. She did retain the right to dower, the use of one-third of the couple’s real estate upon her husband’s death.

If her husband became incapacitated or was absent for a long time, a woman was often expected to manage his affairs—to become a “deputy husband,” as historian Laurel T. Ulrich has explained. Courts recognized the authority of women in such situations to make contracts and to carry on business regardless of whether they had a formal power of attorney. Thus, English common law placed married women in an inferior position but recognized their ability to manage family business. It further confirmed women’s capacity in the *feme sole* status accorded unmarried women. *Femes soles* retained or, in the case of widows, regained the property rights that married women lost. Thus, they could legally establish businesses and support themselves and their families.

Among Eastern Woodlands Indians the lack of private ownership of land worked to women’s benefit. The tribe as a whole claimed ownership rights, not individual members or families. Kinship groups, or extended families, formed the basis of Native American society and government. The heads of kinship groups chose the band’s primary leaders (called SACHEMS) who, with advice, assigned fields for planting, decided where and when to hunt, managed trade and diplomacy, and judged whether to go to war. Among ALGONQUIN-speaking people the heads of extended families were usually men, as were the sachems they chose. However, in IROQUOIS culture women served as clan leaders, taking a share of political power. Iroquois society was matrilineal, with family membership passing from mother to children, and matrilocal, as the husband left his family upon marriage to live with his wife’s family. A woman divorced her husband by setting his possessions outside the door; a man could divorce his wife by removing his belongings from her family’s longhouse. Women elders could not speak publicly at tribal councils or serve as sachems, but they chose these political leaders and advised them on such matters as waging war.

While the family lives of slave women are difficult to reconstruct from the existing records, scholars have argued that they exercised more power within their families than did white women. As slaves, black men did not possess the economic means to provide them a foundation for claims of authority over their wives. In addition, many husbands and wives lived apart, on separate plantations in the South or in separate households in the North, further encouraging the independence of slave women. Bound women, like free women, undertook both productive and reproductive work. In addition, slave women were liable to sexual exploitation by their masters.

### **Work**

In general, women's work roles differed from those of men and varied by class, ethnic origin, and individual need or opportunity. Except in far northern New England, where the growing season was short, East Coast Indians had a mixed economy of AGRICULTURE, gathering, FISHING, and hunting. Native American women were responsible for raising corn, squash, beans, and (where possible) TOBACCO. They also gathered nuts and fruit, built houses, made CLOTHING, took care of the children, and prepared meals, while men cleared land, hunted, fished, and protected the town from enemies. This gender division of labor was somewhat different than that of the English, who believed free women should avoid field work and thus considered Indian women's agricultural labor too onerous.

English women were primarily responsible for domestic tasks, whether they supervised servants and slaves or performed these necessary, productive chores themselves. Their workplace encompassed the house and yard. They prepared and served meals, baked bread, cared for children, built fires, carried water and waste, cleaned the house and furnishings, washed and ironed laundry, gardened, tended poultry, milked cows, and made clothing and other household articles. Some women specialized in one or more activities and traded surplus production with neighbors and shopkeepers. Women in established rural communities were more likely to produce textiles and dairy products than either frontier women, who with their husbands were too busy meeting the challenges of establishing farms, or urban women, who lacked space for spinning wheels, looms, or livestock and could readily purchase manufactured goods and foodstuffs at the market.

Colonial women took responsibility for a large part of medical care, delivering babies, treating wounds and illnesses, and administering drugs. Literate mothers taught their own children to read, and in New England towns some women opened dame schools for young girls and boys. Women throughout the provinces transmitted skills to young women in the "art, trade, and mystery" of housewifery or a specific craft such as weaving. In the ministry

and law, women did not have access to formal professional training, in college or apprenticeships. They did often assist their husbands in trades and took control of businesses after their deaths. Women thus worked in shoemaking, cabinet-making, brewing, printing, and similar CRAFTS; some ran shops, taverns, and inns.

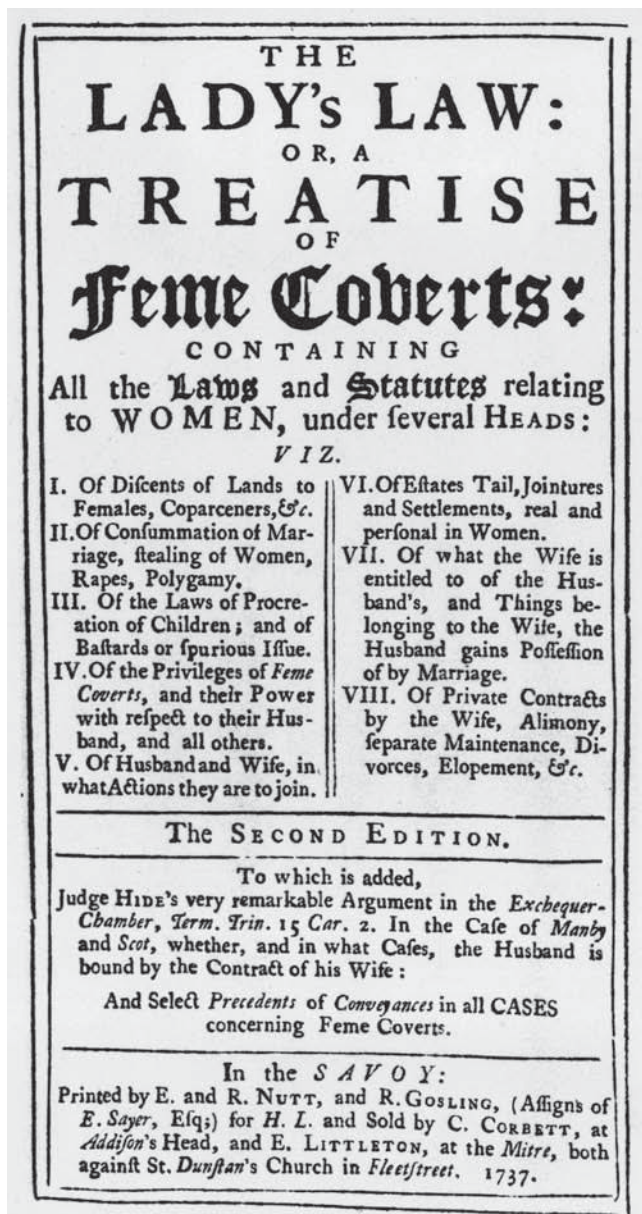

On plantations and farms, where most women lived in colonial British America, their work varied widely by class, ethnicity, and stage of settlement. Under normal circumstances a British colonial farm woman expected to escape heavy fieldwork, except at harvest, just as her husband avoided domestic chores. However, many women and girls worked side by side with men in the fields. Immigrants to 17th-century VIRGINIA and MARYLAND included female indentured servants, who paid for the cost of their transportation by tending a master's tobacco for four or more years. In NEW JERSEY and PENNSYLVANIA servant women from England, Ireland, Scotland, and Germany spent at least part of their labor in the fields. Indeed, German farm women, whether free or bound, customarily tended and harvested crops.

Enslaved African and Native American women worked in many occupations. In areas like the Chesapeake and the Carolinas, with labor-intensive staple crops, most spent long hours performing hard physical labor raising tobacco, corn, and rice. Masters differentiated between men and women in the assignment of tasks other than ordinary fieldwork. Only men had the opportunity to become drivers and ARTISANS. Slave women, usually those too old or too young for fieldwork, served as nurses, cooks, and spinners. Both women and men performed domestic service. At the same time, female slaves were responsible for the household needs of their own families, including laundry, FOOD preparation, and sewing. In the northern colonies enslaved women engaged in a wide variety of tasks, as these colonies lacked staple crops that consumed huge amounts of agricultural labor.

### ***Inheritance Practices***

According to English common law and colonial statutes, a widow had the right of dower to one-third of the couple's real estate for use during her life. The children or other heirs, if adults, received the other two-thirds immediately and the widow's third at her death. If the husband left a will, he was obligated to grant his wife dower (otherwise she could contest the will), but he was free to distribute his personal estate as he saw fit. In regard to the rights of sons and daughters, English common law specified primogeniture, with the eldest son normally receiving all of the real estate. Most colonial parents divided their estates more evenly, attempting to provide all of their children with a start in life, whether a farm, college tuition, an apprenticeship, livestock, or cash. Sons more often received real

Shown here is the title page of a 1737 work on the legal status of women that was imported to Virginia from Britain. (Hulton/Archive)

estate, while daughters received personalty such as slaves, household furniture, or money.

Historians have measured the degree to which husbands adhered to the legal guidelines in making bequests to their wives. Lois Green Carr and Lorena S. Walsh discovered how men in 17th-century Maryland often gave their wives responsibility for managing their entire estates, including the children's share, despite the fact that widows quickly remarried and thereby ceded control of the prop-

erty to their new mates. Early Maryland society was highly unstable and fragmented, with high MORTALITY and disrupted kinship networks. Husbands chose, perhaps because in their minds they had little alternative, to give greater authority to their wives than was customary in England.

In northern colonies, in contrast, more testators lived long enough to see sons reach maturity. They gave less authority to their widows and sometimes adopted a practice that was rare in the Chesapeake area: They devised all of their real estate to one or more sons and made the heirs responsible for supporting their mother. Instead of receiving her dower right of one-third of the real estate for life, the widow obtained possession of a room; the right to pass through the house to and from her room; and firewood, food, use of a horse, and a small amount of cash paid annually.

Ethnicity as well as demographic conditions influenced men's testamentary practices. In NEW YORK during the first generations after the English conquest, Dutch colonists retained the tradition of community property within marriage, that is, that the wife and husband held property jointly. Dying husbands left most or all of their possessions to their wives, who kept control during their widowhood. Sons and daughters, even if mature at the death of their father, had to wait until their mother died or remarried before receiving their inheritance. At that point the children obtained equal portions, with daughters as well as sons receiving real estate.

### Religion

The degree to which a woman could take part in religious affairs depended on her faith. In Native American communities women occasionally served as SHAMANS (priests). Indian religions often recognized both female and male characteristics in their deities. Christianity, which dominated the British settlements, was more patriarchal. In all Christian denominations women stood equal with men in the eyes of God, but the extent to which they could participate in decision making and the ministry varied widely.

Among New England PURITANS women sat separately from the men, could not speak except to sing hymns, and were allowed no leadership role. Their status improved little over the colonial period and, in fact, probably deteriorated after 1650 as they became an increasing proportion of members. Puritan women challenged these restrictions in a variety of ways. Most often they used their influence, or informal authority, to sway the church fathers. Although men alone had the right to cast votes and sign petitions for new churches, women spurred the establishment of new congregations by convincing their husbands of the need. Women of Rowley, MASSACHUSETTS, in 1674 successfully opposed the ordination of their young minister, Jeremiah Shepard, at least in part because he was disrespectful to female members. Other women

challenged the 17th-century Puritan order more dramatically, expressing publicly their less-than-orthodox beliefs. Most famous was ANNE MARBURY HUTCHINSON, who in 1637 was tried for defaming ministers. She defended herself well and nearly escaped conviction but then shocked her judges by announcing that God had told her that they would be destroyed. Hutchinson was banished from the commonwealth and settled in RHODE ISLAND with family and supporters.

The ANGLICAN CHURCH also expected women to accept a subordinate role, as only men could preach, administer the sacraments, and serve on the vestry boards that were in charge of all parish business, including aid to the poor, sick, and elderly. Like Puritans, however, Anglican women wielded informal authority that emanated from their responsibility for religious practice in their families, supervising preparations for burials and marriages, most of which took place at home.

QUAKERS, on the other hand, believed that revelation did not end with the Bible and that the “inner light” could bring new understanding, which revealed that women should serve as ministers, missionaries, and leaders of the church. Quakers also denied any continuing significance of the fall of Adam and Eve, arguing that equality of women and men returned with spiritual rebirth. In their own separate monthly meetings for business, Quaker women made disciplinary decisions concerning women and girls, supervised marriages, and provided relief to the poor. While women Friends lacked complete equality with the men, because most women’s meetings technically were required to seek the men’s permission before disowning anyone, the men’s meetings apparently always approved the women’s decisions.

### *Women and Community*

When women exercised authority in colonial British society, they did so primarily among women and girls. Middle-aged and elderly women took responsibility for the female half of the population. They observed the actions of the community’s young women—not just their own daughters and granddaughters—to guard against sexual offenses and disorderly marriages. If a young girl showed signs of departing from the straight and narrow, they warned her of the consequences of sin. In the Society of Friends, women’s meetings dealt most frequently with unsupervised weddings, marriages to non-Friends, fornication before marriage, and bastardy; these constituted the misdeeds of most female offenders. In Puritan New England, although elder women lacked the institutionalized power of the Quaker meetings, they took responsibility for the behavior and well-being of younger women. Everywhere in colonial British America women were barred from serving as justices or members of juries. Nevertheless, they counseled, reprimanded, and

aided girls and young women who were victims or accused of crimes.

By law the woman held most accountable for reporting sexual misconduct was the midwife, a respected and mature member of the female community. She had such official and semiofficial functions as testifying in court as to whether an unmarried mother had named an infant’s father during labor, reporting whether an infant was born prematurely or at full term, verifying birth dates, and examining female prisoners to determine whether they were truly pregnant or just claiming that condition to avoid punishment. More important to nurturing a community of women, however, was the midwife’s role in orchestrating the activity that brought women together and excluded men—childbirth. During the colonial period professional MIDWIVES presided over most births, which a group of female relatives and neighbors also attended. Childbirth, or “travail,” as the English colonists called it, was imbued with female ritual and tradition, including special bed linen, food, and paraphernalia such as the “midwife’s stool.”

Although elder women carried weight as the guardians of younger women and girls, they lacked political power and thus were subject, like all women, to the judgment and domination of men. In fact, elder women were most at risk of being charged with WITCHCRAFT, defined legally as making a compact or conversing with Satan. The colonists, like their Old World contemporaries, believed that God and the devil both influenced everyday events. Weak individuals, especially women, could be recruited by Satan to perform evil deeds against God’s people. In the British colonies the New England governments prosecuted the great majority of witchcraft cases; this was partly the result of the centrality of religion in society. Also important was the fact that elder women, the people most at risk, were much more numerous in the Puritan colonies than elsewhere during the 17th century, when witchcraft hysteria peaked. According to historian Carol Karlsen, between 1620 and 1725 about 350 New Englanders, mostly women, faced accusations of witchcraft. The most famous episode occurred in Salem, Massachusetts, in 1692, when almost 200 people were accused and 20 persons executed for conspiring with the devil.

Gender differences also existed in the prosecution of other kinds of crime. Women were convicted of murder, theft, fraud, and assault, but at rates much lower than men. The prosecution of women most often stemmed from sexual crimes, especially fornication. A double standard existed in English law granting property rights in the chastity of women to husbands and fathers. A woman’s sexual purity was valued as property, belonging to her father before marriage and her husband after, but wives and mothers had no similar rights in the chastity of men. Thus, adultery committed by a woman was considered more serious than that

committed by a man. The 1648 Massachusetts legal code, for example, defined adultery, which was punishable by death, as illicit sexual relations involving a married woman. If a married man and a single woman had intercourse, they committed fornication, which was not a capital crime. In practice, magistrates reduced the charges of most people accused of adultery, and just a few were put to death for the crime. The same was true in the case of rape, which was also a capital offense in the Bay Colony. Women had difficulty proving that they had not consented to the act. Men of higher status were likely to escape punishment, while white servants and black people received harsh punishment for attacks on white women. Consistent with the double standard, rapes were considered trespasses on the property rights of the assaulted woman's husband or father.

Before 1763, then, the conflicting concepts of women's capability and inferiority defined gender relations in British North America. English custom and law and Protestant theology held women responsible for guaranteeing the smooth operation of households, representing and protecting their families in the absence of husbands, and maintaining God's providence over the community, but required their subordination to men. Indian women held a higher status in their communities, as NATIVE AMERICANS respected women as full participants in the ECONOMY and in land ownership. Iroquois and some Algonquin-speaking groups practiced matrilineal descent and recognized women's leadership in politics and society. Most African-American women in pre-1763 British America were slaves, as the emancipation movement expanded only after that date. As slaves, women had little control over their work and family and were less likely than men to escape their bonds.

**Wood, William** (fl. 1629–1635) *writer, explorer*

William Wood arrived in the MASSACHUSETTS Bay region in 1629 as an agent of English PURITANS who were interested in learning more about North America before they made the decision to migrate. Settling in an area that would become Lynn, he surveyed the region from Dorchester to the Merrimack River, taking extensive notes on the region's Indian inhabitants, including their physical appearance and economic habits, as well as the region's topography and natural resources. Wood was also an enthusiastic entrepreneur who traveled widely up and down the coast in support of

Massachusetts's early FISHING ventures and burgeoning trade with the Natives.

When he returned to England in 1633, Wood became particularly well known for a book that he published in London in 1639 called *New England's Prospect: A True, Lively, and Experimental Description of that Part of America commonly called New England*. He wrote, "To enter into a serious discourse concerning the natural disposition of these Indians might procure admiration from the people of any civilized nations, in regard of their civility and good natures." *New England's Prospect* also included a rare map of the New England coast, entitled "The South Part of New England, as it is planted this yeare, 1634," which became a very accurate guide for many migrants. Together, Wood's account and map played an important role in fueling the great migration of Puritan families to the Massachusetts Bay Colony.

—James E. McWilliams

**Woolman, John** (1720–1772) *theologian, essayist*

John Woolman was born to a prosperous Quaker farm family in Burlington County, NEW JERSEY. He became a shopkeeper, tailor, and schoolteacher rather than follow his father's occupation of farming. He focused early in his life on spiritual matters, becoming a Quaker lay minister at age 22 and beginning the writing that became his enduring legacy.

Influenced by Quaker theology that God's spirit, or the "inner light," could enter everyone regardless of ethnicity or gender, Woolman devoted his life to eradicating SLAVERY. He first indicated his concern when, in his early 20s, his employer asked him to write a bill of sale for an enslaved woman. Although slaveholding was common in his neighborhood, Woolman became committed to the antislavery cause during a 1746 ministerial journey to MARYLAND, VIRGINIA, and NORTH CAROLINA. Upon his return home he wrote *Some Considerations on the Keeping of Negroes; Recommended to the Professors of Christianity of Every Denomination* (1754) but delayed submitting it to the PHILADELPHIA Yearly Meeting overseers of the press because he expected opposition from prominent slaveholding Friends who served on the committee. The essay gently reminded masters of the rule "not to do that to another which . . . we would not have done to us," then warned prophetically of God's wrath if owners refused to free their slaves. This essay, along with the 1754 epistle of the Philadelphia Yearly Meeting that he probably assisted ANTHONY BENEZET in drafting, swayed Quaker opinion against the SLAVE TRADE and later slavery itself.

From 1746 to 1772 Woolman made numerous journeys throughout the mainland British colonies and collaborated with Benezet and other abolitionists to strengthen Friends' discipline against black bondage. He served on

a Philadelphia Yearly Meeting committee to visit every Quaker slave owner in the DELAWARE Valley. He cut back his retail business when it became “attended with more outward care and cumber than was required of me to engage in.” Because Woolman believed that “conduct is more convincing than language,” he tried to live simply because of his belief that luxury had “connection with some degree of oppression” of others. Thus, Woolman stopped wearing dyed CLOTHING because of the use of slave LABOR in producing dyes and sometimes traveled by foot on his ministerial journeys. He tried to live simply because he recognized that luxury for some demanded the exploitation of others. In 1762 Woolman published *Considerations on Keeping Negroes: Part Second*, then recommended monetary restitution to former slaves or their heirs in his remarkable essay *A Plea for the Poor* (1793), published posthumously.

In his *Journal* (1774) and essays Woolman addressed many issues, including EDUCATION, violence and war, injustice toward Indians, the suffering of working animals, and the sinfulness of greed and ostentation. He was particularly insightful in linking the expropriation of Indians, “the offspring of those ancient possessors of the country (in whose eyes we appear as newcomers),” with the oppression of slaves, particularly through the sale of rum made from West Indies sugarcane. The focus of his energies and his enduring legacy remained unequivocal opposition to slavery. In 1772 Woolman died of SMALLPOX at York while visiting England and thus witnessed neither the Quaker prohibition of slave ownership in the mid-1770s nor the gradual emancipation movement in the northern United States.

**Wyatt, Sir Francis** (1588–1644) *government official*

Sir Francis Wyatt served as governor of Virginia from 1621 to 1626 and again from 1639 to 1641. During Wyatt's first term in office, in 1624, Parliament revoked the Virginia Company's charter, thus making him the colony's first royal governor. Wyatt was an able administrator and guided the colony through some of its most difficult trials, including an Indian rebellion in 1622 and the plague of 1622–23, both of which claimed thousands of colonists' lives. Wyatt was also an outspoken advocate for the colony, and he openly criticized company officials for their unreasonable demands and general ignorance of conditions in the colony. He also made repeated appeals to the king for the restoration of Virginia's charter rights, an effort that eventually bore fruit in 1639. Wyatt's second term, largely taken up with matters of TOBACCO regulation, was cut short by the outbreak of the ENGLISH CIVIL WAR in 1641. Charles I, desiring a more compliant representative in Virginia, removed Wyatt in favor of SIR WILLIAM BERKELEY.

**Yale, Elihu** (1649–1721) *businessperson, philanthropist*

Born in BOSTON to American colonists who returned to England in 1651, Elihu Yale was educated in London. In 1670 he went to India in the service of the East India Company in Madras (now Chennai) and rose to the position of governor of the company at Fort St. George in 1682. His work contributed to the consolidation of British power on the subcontinent. A financial scandal within his administration caused his removal as governor in 1692. He returned to England in 1699, having amassed a large fortune from his private trading ventures, and became a high sheriff in 1704. Yale was a generous donor to schools, churches, and missionary societies. In 1718 COTTON MATHER wrote him suggesting the need for a benefactor after whom the Collegiate School of Saybrook, CONNECTICUT, might be named. Yale responded with a gift of nine bales of East India Company goods, which the college sold for 562 British pounds to buy books and erect its new building at New Haven. In 1718 the school was renamed YALE COLLEGE. This was the largest private gift to a college up to that time.

—Deborah C. Taylor

**Yale College**

The “Collegiate School within his Majesties Colony of Connecticut” was founded in 1701 by a group of ministers, including COTTON MATHER, the influential Puritan theologian and writer. Designed to maintain order and tradition, early American colleges followed the English system of training young upper-CLASS men for the ministry and for service to the state. Ministers taught theological and classical studies accompanied by strict discipline. The first classes were held at the home of Rector Abraham Pierson in Killingworth, CONNECTICUT, then moved to Saybrook in 1707. In 1716 the Collegiate School moved to its permanent home in New Haven. Two years later the college

was renamed in honor of ELIHU YALE, who responded to a request for donations from Mather. Yale, born in BOSTON and educated in England, was a wealthy East India Company trader, British civil servant, and philanthropist. He sent nine bales of East India Company goods to New Haven that the college then sold for 562 British pounds to buy books and buildings. In 1731 George Berkeley donated books and his RHODE ISLAND farm to provide further support for the school. The present charter for Yale College, now University, was drawn up in 1745.

**Yamasee**

The Yamasee were a diverse group of Native Americans whose roots lay with the Guale of coastal north FLORIDA. Leaving the major Guale settlements in the early 16th century, the Yamasee settled near the Savannah River in present-day South Carolina. By the 1580s, when Spanish Franciscans established a string of missions throughout Florida and coastal South Carolina, the Yamasee were recognized as a separate people distinct from the Guale of Florida. Much to the frustration of the Spanish missionaries, the Yamasee refused to convert to Roman Catholicism and retained their own religion and cultural integrity.

When the English settled the Carolinas in the 1660s, the Yamasee became central players in a complex system of European-Indian diplomacy and trade. The first traders in the Carolinas were Virginians who allied with the WESTO, who themselves used the coalition with the Virginians to become the dominant Indian power in the region. As part of this process, the Westo drove the Yamasee into northern Florida and southern GEORGIA.

By the 1670s the Virginians were supplanted by a new group of English settlers, many coming from the English Caribbean colony of Barbados. Viewing the Westo as allies of their Virginian enemies and hence as a threat to their control over the South Carolina colony, the new Carolinians

allied with a band of refugee Shawnee, the Savannah. During the first half of the 1680s, they destroyed the Westo as a people. Returning to their homelands, the Yamasee soon became staunch allies of the new South Carolinians.

Heavily involved in trade with the English, during the final decades of the 17th century, the Yamasee joined with their fellow Muskogean speakers, the Creek, to raid Spanish MISSIONS in Florida and southern Georgia. Many of the Yamasee raids took them as far south as the Spanish capital of ST. AUGUSTINE. However, by the 1710s, English traders and settlers began to see the growing strength of their Yamasee and Creek allies as a potential threat; many merchants also viewed all Indian peoples on the southern frontier as potential slaves. Faced with increasing cheating, enslavement, and violence, the Yamasee mounted a coordinated surprise attack on a number of English settlement and trading posts in 1715. The resulting YAMASEE WAR lasted until 1718, when the English and their Cherokee allies defeated the main body of Yamasee warriors at Saltketchers on the South Carolina frontier.

Following their defeat in the Yamasee War, the remaining Yamasee people migrated south into Florida, where they allied with the Spanish for protection. In 1727 most of the remaining Yamasee were killed in an English raid against the Spanish. The handful of survivors sought refuge with the Seminoles and were quickly absorbed into their villages.

—Ronald Schultz

### Yamasee War (1715–1718)

The Yamasee War involved a pan-Indian attempt to retain territorial and cultural integrity on the SOUTH CAROLINA frontier in the face of increasingly violent English attacks on their former Indian allies. Beginning in 1715 with a series of coordinated attacks by the YAMASEE, Creek, and CATAWBA on English traders and frontier settlements, the scale and success of the attacks seriously threatened the existence of the fledgling South Carolina colony. The war continued intermittently for three years as English colonists struggled to suppress the Indian coalition. Only when the Cherokee decided to ally with the British against their Creek enemies were the English able decisively to defeat the Indian alliance. The English coalition crushed the Yamasee and drove the survivors into FLORIDA, where they sought refuge with the Spanish. The Creek and Catawba remained intact as a people, but they were chased well away from established English settlements. To protect themselves further, British South Carolinians entered into an alliance with the IROQUOIS, who systematically attacked the Catawba for the next decade, seriously weakening them as a potential military force.

Like many conflicts between Europeans and Indians, the Yamasee War was ultimately about sovereignty: who would control land and trade. The Yamasee as well as the

Creek and Catawba were eager to trade with British colonists. However, the increasing integration of Indian peoples into larger trade networks worried the English, who both feared and profited from their Indian allies. As a result, English traders turned to fraud, intimidation, and force in their increasingly contentious relations with the Indian people around them. The Yamasee War was an Indian attempt to halt this process and restore their independent position in South Carolina.

### Yeadley, Sir George (1587–1627) *government official*

George Yeadley served as an early governor of VIRGINIA, and he arranged the purchase of the first African slaves in British North America. Born in the Southwark borough of London, England, the son of Ralph Yeadley and Rhoda Marston, Yeadley became a ward of Sir Henry Peyton, his godfather, after his parents died in 1601. Peyton arranged a military apprenticeship, which Yeadley served in the Netherlands. Attaining the rank of captain, he sailed for Virginia in 1609. Delayed by shipwreck, he did not arrive until May 1610. Yeadley served various officials in a military capacity until 1616, when he became deputy governor to Thomas West, baron De La Warr. West spent most of his time in England, leaving Yeadley to govern Virginia until Samuel Argall replaced him on May 15, 1617.

Yeadley returned to England, when he married Temperance Flowerdieu. On November 18, 1618, he was appointed governor of Virginia for a three-year term and knighted by King James I (1603–25) on November 22. Yeadley returned to Virginia to institute a new government that included an assembly comprised of his council and eight elected burgesses. The Virginia Company instructed Yeadley to distribute land to individuals, which, combined with the growth of TOBACCO cultivation, created demand for laborers. Yeadley worked to bring English indentured servants to the colony while governor. He also organized buying the first African slaves in British North America in 1619 as well as purchasing brides for the colony's predominantly male settlers. He became wealthy and one of the largest owners of servants in Virginia. Yeadley died after being reappointed governor.

## yellow fever

One of the most horrific diseases to plague the coastal cities of colonial America was yellow fever. Considered a common CHILDHOOD DISEASE in AFRICA, the yellow fever virus came to the New World on slave ships along with the *Aedes aegypti* mosquito—the insect vector required for transmission. This mosquito preferred living in urban environments, breeding in water-filled artificial containers provided for them by their human hosts. Once infected by this winged vector, patients often suffered high fevers, pains in head, back, and legs, nausea and vomiting, and acute exhaustion. The most serious cases displayed the classic signs of yellow fever: jaundice, black vomit (partially digested blood), and liver or kidney failure. Eventually, many patients slipped into comas, dying from a series of organ failures, internal bleeding, and shock. Survivors, however, enjoyed immunity for life.

Medical historians believe the first yellow fever outbreak in the colonies occurred in the summer of 1693, when the British fleet carried it from Barbados to the port city of BOSTON. The *Aedes aegypti* survived in the water barrels on board ship and kept the infection in circulation by biting nonimmune soldiers and sailors. Although colonial officials instituted a strict quarantine, yellow fever spread into the city. The Native American population, already decimated by other foreign diseases, lived well inland and were thus spared from another new deadly epidemic. Although unaware of how the disease was spread, officials noted that the fever abruptly ended with the advent of cold weather.

Other colonial cities along the eastern seaboard also suffered from yellow fever epidemics. NEW YORK CITY suffered epidemics in 1702 and then on three occasions in the 1740s—1743, 1745, and 1748. In the mid-Atlantic region PHILADELPHIA lost one in six citizens in its 1699 epidemic. It again suffered in 1741, 1747, and 1762. CHARLESTON, a semitropical port city where mosquitoes thrived, endured more epidemics than northern cities. Yellow fever attacked there at least seven times in less than 50 years. The first epidemic struck in 1699, but others followed it in 1703, 1728, 1732, 1739, 1745, and 1748. During the epidemics of the 1740s, West Indian and southern colonial physicians noted that few African slaves sickened or died. They asserted “black” immunity quite erroneously because few American-born slaves experienced yellow fever as a childhood disease, especially in northern seaport towns. After 1748 only Philadelphia in the summer of 1762 had confirmed cases of yellow fever until the 1790s. When yellow fever returned to Philadelphia in 1793, it killed more than 4,000 people and brought the nation’s capital to a standstill.

Yellow fever had political implications for the larger Atlantic world. In combination with MALARIA and other tropical diseases, yellow fever provided a biological shield, protecting West Africa from European invasion until the

invention of tropical medicine in the 19th century. In addition, once Europeans successfully conquered and colonized an island in the CARIBBEAN, the disease aided them in defending their colonies from nonimmune invaders from other European nations.

## Youngs, John (1623–1698) politician

A political agitator and power broker on Long Island, John Youngs was born in April 1623 in Southwold, England, to Joan Herrington Youngs and the Reverend John Youngs, a Puritan minister. His teen years were spent on the move as his family secretly left England, settled briefly in MASSACHUSETTS and CONNECTICUT, and then crossed the Long Island Sound to found the town of Southold on eastern Long Island. Living on land claimed by both Dutch and English, Youngs looked for direction at first from the colony of New Haven and later from Connecticut. The New England colonies enlisted Youngs in 1655 to command a vessel of observation in the Long Island Sound that monitored a group of NARRAGANSETT who threatened to attack the Montauk on Long Island. Eight years later Youngs marched with a band of English raiders who swept Long Island “making a great uproar with colors flying, drums beating, and trumpets sounding” to inform the Dutch population that Long Island belonged to the English. Captain Youngs in particular was singled out by the Dutch as the man who threatened to burn a Dutch village to the ground. In 1664 Youngs participated in the English conquest of NEW NETHERLAND.

With the Dutch obstacle eliminated, Youngs began anew his campaign to place Long Island within the colony of Connecticut, whose religious and ethnic composition and representative government were undoubtedly more appealing to Youngs and his constituents. Nevertheless, Long Island became part of the new colony of NEW YORK and remained so even after Youngs used the brief Dutch reconquest of 1673 and the GLORIOUS REVOLUTION of 1689 to swing the island back to Connecticut.

Youngs served his community as magistrate, deputy, high sheriff, boundary commissioner, and colonel of the militia. He was a member of the panel of judges that convicted Jacob Leisler of treason. Youngs spent his last 12 years on the governor’s council and died in 1698.

**Zeisberger, David** (1721–1808) *missionary, scholar*  
Born in Moravia, David Zeisberger joined the PENNSYLVANIA Moravian community in 1739 and trained as a missionary. He spent most of his life as a missionary to NATIVE AMERICANS. Blessed with extraordinary linguistic skills, he learned to speak many Indian languages, including Mohawk, Onondaga, and DELAWARE, and was adopted into the Onondaga IROQUOIS nation. Zeisberger served as an interpreter for Moravian church officials during their visits to the Indian nations of Pennsylvania and NEW YORK. In 1763 he accompanied 125 Delaware converts who had been ordered to PHILADELPHIA by the governor. One convert had been accused of murder, and the PAXTON BOYS had threatened to kill all the converts. The accused was acquitted in 1764, and the surviving Moravian Delaware and their missionaries were released from protective custody in 1765.

As a missionary Zeisberger followed the Moravian Church's guidelines. Male and female converts, in the role of assistants, helped run the MISSIONS, approving new residents and new candidates for baptism and communion. Women assistants were responsible for ministering to female converts. Zeisberger made it very clear that race was not important, culture was. There were "white Indians" (white Americans who had been captured, usually as children, by Native Americans) at his missions, and he always referred to them and treated them as Indians. One of his own white Moravian assistants married an Indian convert, was adopted into her nation, and consequently "became" an Indian to Zeisberger. Zeisberger's only requirement for conversion was religious conversion; he left all other social constructs alone. Zeisberger's greatest accomplishments occurred after the Revolution, when he founded several villages in Ohio.

**Further reading:** Earl P. Olmstead, *David Zeisberger: A Life among the Indians* (Kent, Ohio: Kent State University Press, 1997).

**Zenger, John Peter** (1697–1746) *journalist, printer*  
John Peter Zenger, a journalist and printer, was involved in an important political court case that had implications for freedom of the press in early America. He was born in the German Palatinate and came to North America in 1710 with a group of refugees sponsored by NEW YORK's incoming governor, Robert Hunter. Zenger was apprenticed to New York printer WILLIAM BRADFORD. In 1719 he set up a printing shop in MARYLAND, but by 1723 he was back in New York working for Bradford. After 1726 he tried, with little success, to compete with his former master. In 1732 and 1733 he joined with LEWIS MORRIS and a group of dissident New York politicians who were trying to end the tenure of that colony's new governor, William Cosby. In 1733 Zenger became the printer and publisher of the *New-York Weekly Journal*, which competed with Bradford's *New-York Gazette* and which featured political satire and criticism of Cosby. James Alexander, a lawyer and ally of Morris's, was the real editor of the newspaper. Zenger printed furiously critical essays of Alexander, Morris, and their associates as well as texts borrowed from English "opposition" authors opposed to the Whig hegemony of Robert Walpole. This development illustrates the increasing attractiveness to American political thinkers of "Commonwealth" or republican political ideas, a phenomenon that continued into the Revolutionary era. Cosby and his allies at first tried to ignore Zenger's jibes, then to ridicule and intimidate their authors, and finally to suppress them. Issues of the *Weekly Journal* were publicly burned, and in late 1734 Zenger was charged with seditious libel against the government. When the case came to trial in 1735 Cosby and New York's chief justice, James DeLancey, tried to rig the proceedings by disbaring Zenger's attorney, Alexander, and by manipulating the jury selection process. They were frustrated by Alexander's old friend ANDREW HAMILTON, a PHILADELPHIA lawyer, who persuaded a jury—over the state's strong objections and to the dismay of DeLancey—that public statements that were "true" could not be libelous. Zenger was acquitted, and,

after a brief period as a symbolic hero, he spent the rest of his life as a relatively obscure printer and publisher. For a long time it was believed that his trial was a landmark in the evolution of American libel and free speech jurisprudence, but scholars have largely abandoned that interpretation. Instead, they recognize the Zenger case as an early and important example of the “political trial” in America.

## **1606–1700**

Dutch monopolize slave trade.

## **1606**

Virginia Companies of London and Plymouth receive patents to colonize lands in North America.

## **1607**

English settlement established at Jamestown.

## **1608**

Champlain founds Quebec.

## **1613–14**

Rolfe experiments with tobacco and marries Pocahontas.

## **1616–21**

European diseases decimate Native American population in New England.

## **1617**

Tobacco first shipped from Virginia.

## **1619**

Africans arrive and are sold in Virginia.

House of Burgesses, the first elected colonial legislature, meets in Virginia.

## **1620**

Pilgrims adopt Mayflower Compact and land at Plymouth.

## **1621**

The Wampanoag sign a peace pact with the Plymouth Pilgrims.

## **1622**

Opechancanough and Powhatan tribes attack Virginia settlements.

## **1624**

Dutch colonize mouth of Hudson River.

English king assumes control of Virginia.

## **1626**

Minuit establishes New Amsterdam.

## **1629**

King Charles I dissolves Parliament in England, encouraging many people to leave for the colonies in North America.

## **1630**

Puritan migration to Massachusetts Bay begins.

## **1632**

Lord Baltimore (George Calvert) receives land grant to establish Maryland.

## **1633–34**

New England Native Americans again attacked by European diseases.

## **1635**

Williams is banished to Rhode Island.

Virginia's Council deports Governor John Harvey, thereby challenging the power of officials appointed by the Crown.

## **1636**

Hutchinson is banished from the Massachusetts Bay Colony.

Williams founds Providence.

Hooker establishes Hartford.

## 436 Chronology

### 1637

New England colonists wage war against the Pequot Indians.

### 1638

Minuit founds New Sweden.

### 1640s

New England merchants begin their engagement in the African slave trade.

Virginia forbids black residents to carry guns.

### 1642–49

English Civil War halts the great Puritan migration to New England.

### 1643

Massachusetts, Plymouth, Connecticut, and New Haven establish the first intercolonial union, the United Colonies of New England.

### 1644

Opechancanough's second attack on colonial Virginians.

### 1650–70

Judicial and legislative decisions in the Chesapeake colonies harden racial differences.

### 1651

Parliament passes the first Navigation Act.

### 1659–61

Puritans execute four Quakers in Boston.

### 1660

Charles II is restored to the English throne.  
Parliament passes new Navigation Act.

### 1662

Half-Way Covenant is introduced in New England.

### 1663

Eight proprietors receive the first Carolina charter.

### 1664

English capture New Netherland and rename it New York.  
Royal grant of the Jersey lands to proprietors.

### 1665

New Jersey becomes a separate colony.

### 1670

First permanent English settlement in South Carolina.

### 1673–85

French expand into Mississippi Valley.

### 1675–76

King Philip's War is fought in New England.

### 1676

Bacon's Rebellion begins in Virginia.

### 1677

The Laws, Concessions and Agreements for West New Jersey provide for the most democratic government of any colony.

### 1680–1700

Transition from white indentured servants to black slave laborers begins in Chesapeake.

### 1680

Charleston is established.  
Pueblo Revolt in New Mexico.

### 1681

William Penn receives Pennsylvania charter.

### 1682

La Salle explores the Mississippi River and claims Louisiana for France.

### 1684

Massachusetts charter is revoked.

### 1685–1715

Stagnation takes hold in the tobacco market.

### 1686

Dominion of New England is established.

### 1688

Pennsylvania Quakers issue a formal protest against slavery in America.

### 1688–89

Glorious Revolution occurs in England.

### 1689

Leisler's Rebellion breaks out in New York.  
Overthrow of Governor Andros in New England takes place.

As a result of the Glorious Revolution, royal governors are removed in Massachusetts, New York, and Maryland.

### 1689–97

King William's War is fought.

**1691**

Leisler is executed in New York.

**1692**

Witchcraft hysteria occurs in Salem; 19 people are executed.

**1696**

Parliament creates Board of Trade.

The Royal African Trade Company loses its monopoly on the African slave trade, encouraging New England merchants to enter into the trade.

**1699**

French establish Louisiana.

**1700**

Spanish install first mission in Arizona.

**1701**

First colonial unicameral legislature meets in Pennsylvania.

Iroquois establish a policy of neutrality among European nations.

**1702–13**

Queen Anne's War is fought.

**1704**

The first colonial newspaper, the *Boston News-Letter*, is published.

**1705**

Virginia adopts a comprehensive slave code.

**1707**

English-Scottish union creates kingdom of Great Britain.

**1712**

Slaves revolt in New York City.

**1713**

Peace of Utrecht ends Queen Anne's War.

Scots-Irish and German immigration to North America begins.

**1715**

Yamasee War devastates South Carolina.

**1715–30**

Volume of African slave trade doubles.

**1716**

Spanish begin to colonize Texas.

**1718**

French establish New Orleans.

**1720s**

Black population begins to increase naturally.

**1721**

Smallpox variolation (inoculation) is introduced in Boston.

**1726**

Poor people in Philadelphia riot, tearing down and burning the pillories and stocks.

**1732**

Georgia charter is granted by Parliament.

**1733**

Molasses Act is passed.

**1734–36**

Great Awakening begins in Northampton, Massachusetts.

**1735**

Zenger is acquitted of seditious libel in New York.

**1739**

Slave revolt in Stono, South Carolina, occurs.

Whitefield's first American visit spreads the Great Awakening.

**1740s**

Indigo becomes a major crop in the Lower South.

**1741**

Slave conspiracy in New York City takes place.

**1744–48**

King George's War is fought.

**1747**

Benjamin Franklin publishes the first *Poor Richard's Almanack*.

A major riot in Boston breaks out against impressment by the Royal Navy.

**1754**

The first congress of all the colonies meets at Albany and agrees on a Plan of Union (which the British government rejects).

**1755**

Braddock is defeated by the Indians and their French allies.

British exile Acadians from Nova Scotia.

**1756–63**

Seven Years' War is fought.

## 438 Chronology

### 1758

British seize Fort Duquesne, Fortress Louisbourg, and Fort Frontenac.

### 1759

Wolfe dies while defeating the French at Quebec.

### 1760

French Canada surrenders to the British.

Africans account for 20 percent of the inhabitants in the colonies.

### 1760–61

Cherokee War is fought against the colonists in South Carolina.

### 1760s

Economic depression occurs in many colonies.

Spanish found California mission system.

### 1763

Treaty of Paris ends Seven Years' War.

Proclamation of 1763 legally limits westward expansion of colonists.

## Governor John Winthrop, “Model of Christian Charity” (1630)

*The Winthrop Papers* (Boston: Massachusetts Historical Society), Vol. 2, pp. 282–295

1. For the persons, we are a Company professing ourselves fellow members of Christ. . .

2. for the work we have in hand, it is by mutual consent through a special overruling providence, and more than an ordinary approbation of the Churches of Christ to seek out a place of Cohabitation and Consortship under a due form of Government both civil and ecclesiastical. . . .

3. The end is to improve our lives to do more service to the Lord the comfort and increase of the body of christ whereof we are members that ourselves and posterity may be the better preserved from the Common corruptions of this evil world. . . .

4. for the means whereby this must be effected, they are 2fold, a Conformity with the work and end we aim at, these we see are extraordinary, therefore we must not content ourselves with usual ordinary means whatsoever we did or ought to have done when we lived in England, the same must we do and more also where we go: That which the most in their Churches maintain as a truth in profession only, we must bring into familiar and constant practice, as in this duty of love we must love brotherly without dissimulation, we must love one another with a pure heart fervently we must bear one another’s burdens, we must not look only on our own things, but also on the things of our brethren, neither must we think that the lord will bear with such failings at our hands as he doth from those among whom we have lived. . . .

. . . [F]or we must Consider that we shall be as a City upon a Hill, the eyes of all people are upon us; so that if we shall deal falsely with our god in this work we have

undertaken and so caused him to withdraw his present help from us, we shall be made a story and a by-word through the world, we shall open the mouths of enemies to speak evil of the ways of god and all professors for God’s sake; we shall shame the faces of many of gods worthy servants, and cause their prayers to be turned into Curses upon us till we be consumed out of the good land whether we are going.

## John Mason’s Account of the Puritan-Pequot War (1637)

David J. Rothman and Sheila M. Rothman, eds.,  
*Sources of the American Social Tradition*  
(New York: Basic Books, 1975 ), pp. 32–35

### To the Honourable the General Court of Connecticut

Honoured Gentlemen, . . .

In the Beginning of May 1637 there were sent out by Connecticut Colony Ninety Men under the Command of Capt. John Mason against the Pequots, with Onkos an Indian Sachem living at Mohegan, who was newly revolted from the Pequots. . . .

In the Morning, we awaking and seeing it very light, supposing it had been day, and so we might have lost our Opportunity, having purposed to make our Assault before Day; rowed the Men with all expedition, and briefly commended ourselves and Design to God, thinking immediately to go to the Assault; the Indians shewing us a Path, told us that it led directly to the Fort. . . . Then Capt. Underhill came up, who marched in the Rear; and commending ourselves to God, divided our Men: There being two Entrances into the Fort, intending to enter both at once: Captain Mason leading up to that on the North East Side;

who approaching within one Rod, heard a Dog bark and an Indian crying Owanux! Owanux! Which is Englishmen! Englishmen! We called up our Forces with all expedition, gave Fire upon them through the Pallizado; the Indians being in a dead indeed their last Sleep: Then we wheeling off fell upon the main Entrance, which was blocked up with Bushes about Breast high, over which the Captain passed, intending to make good the Entrance, encouraging the rest to follow. Lieutenant Seeley endeavoured to enter; but being somewhat cumbred, stepped back and pulled out the Bushes and so entred, and with him about sixteen Men: We had formerly concluded to destroy them by the Sword and save the Plunder.

Whereupon Captain Mason seeing no Indians, entred a Wigwam; where he was beset wit many Indians, waiting all opportunities to lay Hands on him, but could not prevail. At length William Heydon espying the Breach in the Wigwam, supposing some English might be there, entred; but in his Entrance fell over a dead Indian; but speedily recovering himself, the Indians some fled, others crept under their Beds: The Captain going out of the Wigwam saw many Indians in the Lane or Street; he making towards them, they fled, were pursued to the End of the Lane, where they were met by Edward Pattison, Thomas Barber, with some others; where seven of them were Slain, as they said. The Captain facing about, Marched a slow pace up the Lane he came down, perceiving himself very much out of Breath; and coming to the other End near the Place where he first entered, saw two Soldiers standing close to the Pallizado with their Swords pointed to the Ground: The Captain told them that We should never kill them after that manner: The Captain also said, We must Burn them; and immediately stepping into the Wigwam where he had been before, brought out a Firebrand, and putting it into the Matts with which they were covered, set the Wigwams on Fire. Lieutenant Thomas Bull and Nicholas Omsted beholding, came up; and when it was thoroughly kindled, the Indians ran as Men most dreadfully Amazed.

And indeed such a dreadful Terror did the Almighty let fall upon their Spirits, that they would fly from us and run into the very Flames, where many of them perished. And when the Fort was thoroughly Fired, Command was given, that all should fall off and surround the Fort; which was readily attended by all; only one Arthur Smith being so wounded that he could not move out of the Place, who was happily espied by Lieutenant Bull, and by him rescued. . . .

Thus were they now at their Wits End, who not many Hours before exalted themselves in their great Pride, threatning and resolving the utter Ruin and Destruction of all English, Exulting and Rejoycing with Songs and Dances: But God was above them, who laughed his Enemies and the Enemies of his People to Scorn, making them as a fiery Oven: Thus were the Stout Hearted spoiled, having slept

their last Sleep, and none of their Men could find their Hands: Thus did the Lord judge among the Heathen, filling the Place with dead Bodies!

And here we may see the just Judgment of God, in sending even the very Night before this Assault, One hundred and fifty Men from their other Fort, to join with them of that Place, who were designed as some of themselves reported to go forth against the English, at that very Instant when this heavy Stroak came upon them where they perished with their Fellows. So that the Mischief they intended to us, came upon their own Plate: They were taken in their own snare, and we through Mercy escaped. And thus in little more than one Hour's space was their impregnable Fort with themselves utterly Destroyed, to the Number of six or seven Hundred, as some of themselves confessed. There were only seven taken captive, and about seven escaped.

Of the English, there were two Slain outright, and about twenty Wounded: Some Fainted by reason of the sharpness of the Weather, it being a cool Morning, and the want of such Comforts and Necessaries as were needful in such a Case. . . .

And was not the Finger of God in all this? . . . What shall I say: God was pleased to hide us in the Hollow of his Hand; I still remember a Speech of Mr. Hooker at our going abroad; That they should be Bread for us. And thus when the Lord turned the Captivity of his People, and turned the Wheel upon their Enemies; we were like Men in a Dream; then was our Mouth filled with Laughter, and our Tongues with Singing; thus we may say the Lord hath done great Things for us among the Heathen, whereof we are glad. Praise ye the Lord!

### Chrestien LeCler, "A Micmac Indian Responds to the French," (ca. 1677)

Chrestien LeCler, *New Relation of Gaspesia, with the Customs and Religion of the Gaspesian Indians*, ed. and trans. William F. Ganong (Toronto: Champlain Society, 1910), pp. 104–106

I am greatly astonished that the French have so little cleverness, as they seem to exhibit in the manner of which thou hast just told me on their behalf, in the effort to persuade us to convert our poles, our barks, and our wigwams into those houses of stone and of wood which are tall and lofty, according to their account, as these trees. Very well! But why now, . . . do men of five to six feet in height need houses which are sixty to eighty? For, in fact, as thou knowest very well thyself, Patriarch—do we not find in our own all the conveniences and the advantages that you have with yours, such as reposing, drinking, sleeping, eating, and amusing ourselves with our friends when we wish? This is not all, . . . my brother, hast thou as much ingenuity and

cleverness as the Indians, who carry their houses and their wigwams with them so that they may lodge wheresoever they please, independently of any seignior whatsoever? Thou art not as bold nor as stout as we, because when thou goest on a voyage thou canst not carry upon thy shoulders thy buildings and thy edifices. Therefore it is necessary that thou preparest as many lodgings as thou makest changes of residence, or else thou lodgest in a hired house which does not belong to thee. As for us, we find ourselves secure from all these inconveniences, and we can always say, more truly than thou, that we are at home everywhere, because we set up our wigwams with ease wheresoever we go, and without asking permission of anybody. Thou reproachest us, very inappropriately, that our country is a little hell in contrast with France, which thou comparest to a terrestrial paradise, inasmuch as it yields thee, so thou sayest, every kind of provision in abundance. Thou sayest of us also that we are the most miserable and most unhappy of all men, living without religion, without manners, without honour, without social order, and, in a word, without any rules, like the beasts in our woods and our forests, lacking bread, wine, and a thousand other comforts which thou hast in superfluity in Europe. Well, my brother, if thou dost not yet know the real feelings with our Indians have towards thy country and towards all thy nation, it is proper that I inform thee at once. I beg thee now to believe that, all miserable as we seem in thine eyes, we consider ourselves nevertheless much happier than thou in this, that we are very content with the little that we have; and believe also once for all, I pray, that thou deceivest thyself greatly if thou thinkest to persuade us that thy country is better than ours. For if France, as thou sayest, is a little terrestrial paradise, art thou sensible to leave it? And why abandon wives, children, relatives, and friends? Why risk thy life and thy property every year, and why venture thyself with such risk, in any season whatsoever, to the storms and tempests of the sea in order to come to a strange and barbarous country which thou considerest the poorest and least fortunate of the world? Besides, since we are wholly convinced of the contrary, we scarcely take the trouble to go to France, because we fear, with good reason, lest we find little satisfaction there, seeing, in our own experience, that those who are natives thereof leave it every year in order to enrich themselves on our shores. We believe, further, that you are also incomparably poorer than we, and that you are only simple journeymen, valets, servants, and slaves, all masters and grand captains though you may appear, seeing that you glory in our old rags and in our miserable suits of beaver which can no longer be of use to us, and that you find among us, in the fishery for cod which you make in these parts, the wherewithal to comfort your misery and the poverty which oppresses you. As to us, we find all our riches and all our conveniences among

ourselves, without trouble and without exposing our lives to the dangers in which you find yourselves constantly through your long voyages. And, whilst feeling compassion for you in the sweetness of our repose, we wonder at the anxieties and cares which you give yourselves night and day in order to load your ship. We see also that all your people live, as a rule, only upon cod which you catch among us. It is everlastingly nothing but cod—cod in the morning, cod at midday, cod at evening, and always cod, until things come to such a pass that if you wish some good morsels, it is at our expense; and you are obliged to have recourse to the Indians, who you despise so much, and to beg them to go a-hunting that you may be regaled. Now tell me this one little thing, if thou hast any sense: Which of these two is the wisest and happiest—he who labours without ceasing and only obtains, and that with great trouble, enough to live on, or he who rests in comfort and finds all that he needs in the pleasure of hunting and fishing? It is true, . . . that we have not always had the use of bread and of wine which your France produces; but, in fact, before the arrival of the French in these parts, did not the Gaspesians live much longer than now? And if we have not any longer among us any of those old men of a hundred and thirty to forty years, it is only because we are gradually adopting your manner of living, for experience is making it very plain that those of us live longest who, despising your bread, your wine, and your brandy, are content with their natural food of beaver, of moose, of waterfowl, and fish, in accord with the custom of our ancestors and of all the Gaspesian nation. Learn now, my brother, once for all, because I must open to thee my heart: there is no Indian who does not consider himself infinitely more happy and more powerful than the French.

### Nathaniel Bacon's Charges against the Virginia Governor (1676)

Nathaniel Bacon, "Declaration of Nathaniel Bacon in the Name of the People of Virginia, July 30, 1676," in *The Southern Colonies*, Vol. 3, part 2 of *Foundations of Colonial America: A Documentary History*, ed. W. Keith Kavenagh (New York: Chelsea House, 1973), pp. 1,783–1,784

1. For having, upon spacious pretences of public works, raised great unjust taxes upon the commonalty for the advancement of private favorites and other sinister ends, but no visible effects in any measure adequate; for not having, during this long time of his government, in any measure advanced this hopeful colony either by fortifications, towns, or trade.
2. For having abused and rendered contemptible the magistrates of justice by advancing to places of judicature scandalous and ignorant favorites.

3. For having wronged his Majesty's prerogative and interest by assuming monopoly of the beaver trade and for having in it unjust gain betrayed and sold his Majesty's country and the lives of his loyal subjects to the barbarous heathen.

4. For having protected, favored, and emboldened the Indians against his Majesty's loyal subjects, never contriving, requiring, or appointing any due or proper means of satisfaction for their many invasions, robberies, and murders committed upon us.

5. For having, when the army of English was just upon the track of those Indians, who now in all places, burn, spoil, murder, and when we might with ease have destroyed them who then were in open hostility, for then having expressly countermanded and sent back our army by passing his word for the peaceable demeanor of the said Indians, who immediately prosecuted their evil intentions, committing horrid murders and robberies in all places, being protected by the said engagement and word past of him the said Sir William Berkeley, having ruined and laid desolate a great part of his majesty's country, and have now drawn themselves into such obscure and remote places and are by their success so emboldened and confirmed by their confederacy so strengthened that the cries of blood are in all places, and the terror and consternation of people so great, are now become not only a difficult but a formidable enemy who might at first with ease have been destroyed.

6. And lately, when upon the loud outcries of blood, the assembly had, with all care, raised and framed an army for the preventing of further mischief and safe-guard of this his Majesty's colony.

7. For having, with only the privacy of some few favorites without acquainting the people, only by the alteration of a figure, forged a commission, by we know not what hand, not only without but even against the consent of the people, for the raising and effecting civil war and destruction, which being happily and without bloodshed prevented; for having the second time attempted the same, thereby calling down our forces from the defense of the frontiers and most weakly exposed places.

8. For the prevention of civil mischief and ruin amongst ourselves while the barbarous enemy in all places did invade, murder, and spoil us, his Majesty's most faithful subjects.

Of this and the aforesaid articles we accuse Sir William Berkeley as guilty of each and every one of the same, and as one who traitorously attempted, violated, and injured his Majesty's interest here by a loss of a great part of this his colony and many of his faithful loyal subjects by him betrayed and in a barbarous and shameful manner exposed to the incursions and murder of the heathen. And we do further declare these the ensuing persons in this list to have been wicked and pernicious councillors, confederates, aid-

ers, and assisters against the commonalty in these our civil commotions.

*Sir Henry Chichley   Nicholas Spencer  
Lt. Col. Christopher Wormeley   Joseph Bridger  
Phillip Ludwell   William Claiborne, Jr.  
Ri: Lee   Thomas Hawkins  
Thomas Ballard   William Sherwood  
William Cole   John Page Clerke  
Richard Whitacre   John Cluffe Clerk  
John West, Hubert Farrell, Thomas Reade, Math. Kempe*

And we do further demand that the said Sir William Berkeley with all the persons on this list be forthwith delivered up or surrender themselves within four days after the notice hereof, or otherwise we declare as follows.

That in whatsoever place, house, or ship, any of the said persons shall reside, be hid, or protected, we declare the owners, masters, or inhabitants of the said places to be confederates and traitors to the people and the estates of them is also of all the aforesaid persons to be confiscated. And this we, the commons of Virginia, do declare, desiring a firm union amongst ourselves that we may jointly and with one accord defend ourselves against the common enemy. And let not the faults of the guilty be the reproach of the innocent, or the faults or crimes of the oppressors divide and separate us who have suffered by their oppressions.

These are, therefore, in his Majesty's name, to command you forthwith to seize the persons above mentioned as traitors to the King and country and them to bring to Middle Plantation and there to secure them until further order, and, in case of opposition, if you want any further assistance you are forthwith to demand it in the name of the people in all countries of Virginia.

*Nathaniel Bacon*  
General by consent of the people.

### Jonathan Edwards, "Sinners in the Hands of an Angry God" (1741)

Samuel Austin, ed., *The Works of President Edwards*,  
6 vols. (Worcester, Mass.: Isaiah Thomas, 1808),  
Vol. 2, pp. 72–79

. . . This that you have heard is the case of every one of you that are out of Christ. That world of misery, that lake of burning brimstone, is extended abroad under you. There is the dreadful pit of glowing flames of the wrath of God; there is hell's wide gaping mouth open; and you have nothing to stand upon, nor any thing to take hold of; there is nothing between you and hell but the air; 'tis only the power and mere pleasure of God that hold you up.

You probably are not sensible of this; you find you are kept out of hell, but don't see the hand of God in it, but look at other things, as the good state of your bodily constitution, your care of your own life, and the means you use for your own preservation. But indeed these things are nothing; if God should withdraw his hand, they would avail no more to keep you from falling, than the thin air to hold up a person that is suspended in it.

Your wickedness makes you as it were heavy as lead, and to tend downwards with great weight and pressure towards hell; and, if God should let you go, you would immediately sink, and swiftly descend and plunge into the bottomless gulf; and your healthy constitution, and your own care and prudence, and best contrivance, and all your righteousness, would have no more influence to uphold you and keep you out of hell, than a spider's web would have to stop a falling rock. . . .

The God that holds you over the pit of hell, much as one holds a spider or some loathsome insect over the fire, abhors you, and is dreadfully provoked. His wrath towards you burns like fire; he looks upon you as worthy of nothing else but to be cast into the fire. He is of purer eyes than to bear you his sight; you are ten thousand times as abominable in his eyes as the most hateful, venomous serpent is in ours. You have offended him infinitely more than ever a stubborn rebel did his prince, and yet 'tis nothing but his hand that holds you from falling into the fire every moment. . . .

O sinner! Consider the fearful danger you are in! 'Tis a great furnace of wrath, a wide and bottomless pit, full of fire and of wrath that you are held over in the hand of that God whose wrath is provoked and incensed as much against you as against many of the damned in hell. You hang by a slender thread, with the flames of Divine wrath flashing about it, and ready every moment to singe it and burn it asunder. . . .

It would be dreadful to suffer this fierceness and wrath of Almighty God one moment; but you must suffer it to all eternity. There will be no end to this exquisite, horrible, misery. . . .

How dreadful is the state of those that are daily and hourly in danger of this great wrath and infinite misery! But this is the dismal case of every soul in this congregation that has not been born again, however moral and strict, sober and religious, they may otherwise be. Oh! that you would consider it, whether you be young or old!

### William Moraley's Account of Slaves, Servants, and Witches (1743)

William Moraley, *The Infortunate: The Voyage and Adventures of William Moraley, an Indentured Servant*, 2nd ed., eds. Susan E. Klepp and Billy G. Smith (University Park: Pennsylvania State University Press, 2005)

At the first Peopling [of] these Colonies, there was a Necessity of employing a great Number of Hands, for the clearing the Land, being over-grown with Wood for some Hundred of Miles; to which Intent, the first Settlers not being sufficient of themselves to improve those Lands, were not only obliged to purchase a great Number of *English* Servants to assist them, to whom they granted great Immunities, and at the Expiration of their Servitude, Land was given to encourage them to continue there; but were likewise obliged to purchase Multitudes of Negro Slaves from *Africa*, by which Means they are become the richest Farmers in the World, paying no Rent, nor giving Wages either to purchased Servants or Negro Slaves; so that instead of finding the Planter Rack-rented, as the *English* Farmer, you will taste of their Liberality, they living in Affluence and Plenty.

The Condition of the Negroes is very bad, by reason of the Severity of the Laws, there being no Laws made in Favour of these unhap[p]y Wretches: For the least Trespass, they undergo the severest Punishment; but their Masters make them some amends, by suffering them to marry, which makes them easier, and often prevents their running away. The Consequence of their marrying is this, all their Posterity are Slaves without Redemption; and it is in vain to attempt an Escape, tho' they often endeavour it; for the Laws against them are so severe, that being caught after running away, they are unmercifully whipped; and if they die under the Discipline, their Masters suffer no Punishment, there being no Law against murdering them. So if one Man kills another's Slave, he is only obliged to pay his Value to the Master, besides Damages that may accrue for the Loss of him in his Business.

The Masters generally allow them a Piece of Ground, with Materials for improving it. The Time of working for themselves, is *Sundays*, when they raise on their own Account divers Sorts of Corn and Grain, and sell it in the Markets. They buy with the Money Cloaths for themselves and Wives; as for the Children, they belong to the Wives Master, who bring them up; so the Negro need fear no Expense, his Business being to get them for his Master's use, who is as tender of them as his own Children. On *Sundays* in the evening they converse with their Wives, and drink Rum, or Bumbo, and smook Tobacco, and the next Morning return to their Master's Labour.

They are seldom made free, for fear of being burthensome to the Provinces, there being a Law, that no Master shall manumise them, unless he gives Security they shall not be thrown upon the Province, by settling Land on them for their Support.

Their Marriages are diverting; for when the Day is appointed for the Solemnization, Notice is given to all the Negroes and their Wives to be ready. The Masters of the new Couple provide handsomely for the Entertainment of

the Company. The Inhabitants generally grace the Nuptials with their Presence, when all Sorts of the best Provisions are to be met with. They chuse some *Englishman* to read the Marriage Ceremony out of the Common Prayer Book; after which they sing and dance and drink till they get drunk. Then a Negro goes about the Company and collects Money for the Use of the Person who marry'd them, which is laid out in a Handkerchief, and presented to him.

This is the only free Day they have, except Sundays, throughout the whole Course of their Lives, for then they banish from them all Thoughts of the Wretchedness of their Condition. The Day being over, they return to their Slavery. I have often heard them say, they did not think God made them Slaves, any more than other Men, and wondered that Christians, especially *Englishmen*, should use them so barbarously. But there is a Necessity of using them hardly, being of an obdurate, stubborn Disposition; and when they have it in their Power to rebel, are extremely cruel.

The Condition of bought Servants is very hard, notwithstanding their indentures are made in *England*, wherein it is expressly stipulated, that they shall have, at their Arrival, all the Necessaries specified in those Indentures, to be given 'em by their future Masters, such as Clothes, Meat, and Drink; yet upon Complaint made to a Magistrate against the Master for Nonperformance, the Master is generally heard before the Servant, and it is ten to one if he does not get his Licks for his Pains, as I have experienced upon the like Occassion, to my Cost.

If they endeavor to escape, which is next to impossible, there being a Reward for taking up any Person who travels without a Pass, which is extended all over the *British* Colonies, their Masters immediately issue out a Reward for the apprehending them, from Thirty Shillings to Five Pound, as they think proper, and this generally brings them back again. Printed and Written Advertisements are also set up against the Trees and publick Places in the Town, besides those in the News-papers. Notwithstanding these Difficulties, they are perpetually running away, but seldom escape; for a hot Pursuit being made, brings them back, when a Justice settles the Expences, and the Servant is oblig'd to serve a longer time. . . .

After I had continued with this Gentleman some time, I returned towards *Burlington*, and went and lived with my first Master, who sent me to *Mount Holly*, where I was witness to one of the strangest Pieces of Folly that was ever acted. Certain old Women, of Melancholick Physognomy, had got the Character of Witches; and being questioned on that Account, and not able to clear themselves, were obliged to undergo a Ducking, in order to prove whether or not they were such.

The Notion run, if they sunk, they were no Witches; but if they swam, they were, and shou'd be punished as such. But they miraculously escaped the Censure of the Law, by sink-

ing, tho' they remained a considerable Time on the Surface of the Water. But this not satisfying one *Jonathan Wright* he proposed to weigh them in Scales against the Bible, and concluded, if they were Witches, they would not weigh so heavy as the Bible; but to the Surprise of the Beholders, they weighed down both Prophets and Apostles.

After this foolish Adventure, I went back to *Burlington*, and lived again with the Blacksmith. This being the Time they gather the *Indian* Corn into their Grannaries, the Townspeople were busy in husking it for that Purpose. The Neighbours assist one another in stripping the Corn from the Husks, and are treated with Rum and Punch; but Persons of Figure provide a grand Entertainment. Every Night, for a Fortnight, I was busy at one or other of these Meetings.

### Gottlieb Mittelberger's Account of Immigration (1750)

Gottlieb Mittelberger, *Journey to Pennsylvania*, eds. Oscar Handlin and John Clive (Cambridge, Mass.: Belknap Press of Harvard University Press, 1960)

When the ships have weighed anchor for the last time, usually off Cowes in Old England, then both the long sea voyage and misery begin in earnest. For from there the ships often take eight, nine, ten, or twelve weeks sailing to Philadelphia, if the wind is unfavorable. But even given the most favorable winds, the voyage takes seven weeks.

During the journey the ship is full of pitiful signs of distress—smells, fumes, horrors, vomiting, various kinds of sea sickness, fever, dysentery, headaches, heat, constipation, boils, scurvy, cancer, mouth-rot, and similar afflictions, all of them caused by the age and the highly-salted state of the food, especially of the meat, as well as by the very bad and filthy water, which brings about the miserable destruction and death of many. Add to all that shortage of food, hunger, thirst, frost, heat, dampness, fear, misery, vexation, and lamentation as well as other troubles. Thus, for example, there are so many lice, especially on the sick people, that they have to be scraped off the bodies. All this misery reaches its climax when in addition to everything else one must also suffer through two to three days and nights of storm, with everyone convinced that the ship with all aboard is bound to sink. In such misery all the people on board pray and cry pitifully together. . . .

Among those who are in good health impatience sometimes grows so great and bitter that one person begins to curse the other, or himself and the day of his birth, and people sometimes come close to murdering one another. Misery and malice are readily associated, so that people begin to cheat and steal from one another. And then one always blames the other for having undertaken the voyage.

Often the children cry out against their parents, husbands against wives and wives against husbands, brothers against sisters, friends and acquaintances against one another.

But most of all they cry out against the thieves of human beings! Many groan and exclaim: "Oh! If only I were back at home, even lying in my pig-sty!" Or they call out: "Ah, dear God, if I only once again had a piece of good bread or a good fresh drop of water." Many people whimper, sigh, and cry out pitifully for home. . . .

When at last after the long and difficult voyage the ships finally approach land, when one gets to see the headlands for the sight of which the people on board had longed so passionately, then everyone crawls from below to the deck, in order to look at the land from afar. And people cry for joy, pray and sing praises and thanks to God. The glimpse of land revives the passengers, especially those who are half-dead of illness. Their spirits, however weak they had become, leap up, triumph, and rejoice within them. . . .

When the ships finally arrive in Philadelphia after the long voyage only those are let off who can pay their sea freight or can give good security. The others, who lack the money to pay, have to remain on board until they are purchased and until their purchasers can thus pry them loose from the ship. In this whole process the sick are the worst off, for the healthy are preferred and are more readily paid for. The miserable people who are ill must often still remain at sea and in sight of the city for another two or three weeks—which in many cases means death. Yet many of them, were they able to pay their debts and to leave the ships at once, might escape with their lives. . . .

This is how the commerce in human beings on board ships takes place. Every day Englishmen, Dutchmen, and High Germans come from Philadelphia and other places, some of them very far away, sometime twenty or thirty or forty hours' journey, and go on board the newly arrived vessel that has brought people from Europe and offers them for sale. From among the healthy they pick those suitable for the purposes for which they require them. Then they negotiate with them as to the length of the period for which they will go into service in order to pay off their passage, the whole amount of which they generally still owe. When an agreement has been reached, adult persons by written contract bind themselves to serve for three, four, five or six years, according to their health and age. The very young, between the ages of ten and fifteen, have to serve until they are twenty-one however.

Many parents in order to pay their fares in this way and get off the ship must barter and sell their children as if they were cattle. Since the fathers and mothers often do not know where or to what masters their children are to be sent, it frequently happens that after leaving the vessel, parents and children do not see each other for years on end, or even for the rest of their lives.

## Mary Jemison's Account of Her Capture by the Iroquois (1755)

James E. Seaver, *A Narrative of the Life of Mrs. Mary Jemison* (n.p., 1824)

. . . Our family, as usual, was busily employed about their common business. Father was shaving an axe-helve at the side of the house; mother was making preparations for breakfast;—my two oldest brothers were at work near the barn; and the little ones, with myself, and the woman and her three children, were in the house.

Breakfast was not yet ready, when we were alarmed by the discharge of a number of guns, that seemed to be near. Mother and the women before mentioned, almost fainted at the report, and every one trembled with fear. . . .

. . . They first secured my father, and then rushed into the house, and without the least resistance made prisoners of my mother, Robert, Matthew, Betsey, the woman and her three children, and myself, and then commenced plundering. . . .

The party that took us consisted of six Indians and four Frenchmen, who immediately commenced plundering, as I just observed, and took what they considered most valuable; consisting principally of bread, meal and meat. Having taken as much provision as they could carry, they set out with their prisoners in great haste, for fear of detection, and soon entered the woods. . . .

Early the next morning the Indians and Frenchmen that we had left the night before, came to us; but our friends were left behind. It is impossible for any one to form a correct idea of what my feelings were at the sight of those savages, whom I supposed had murdered my parents and brothers, sister and friends, and left them in the swamp to be devoured by wild beasts! But what could I do? . . .

My suspicions as to the fate of my parents proved too true; for soon after I left them they were killed and scalped, together with Robert, Matthew, Betsey, and the woman and her two children, and mangled in the most shocking manner. . . .

After a hard day's march we encamped in a thicket, where the Indians made a shelter of boughs, and then built a good fire to warm and dry our benumbed limbs and clothing; for it had rained some through the day. . . .

In the course of the night they made me to understand that they should not have killed the family if the whites had not pursued them. . . .

At the place where we halted, the Indians combed the hair of the young man, the boy and myself, and then painted our faces and hair red, in the finest Indian style. We were then conducted into the fort, where we received a little bread and were then shut up and left to tarry alone through the night. . . .

The morning at length arrived, and our masters came early and let us out of the house. . . .

. . . [I]t was not long before I was in some measure relieved by the appearance of two pleasant looking squaws of the Seneca tribe, who came and examined me attentively for a short time, and then went out. After a few minutes absence they returned with my former masters, who gave me to them to dispose of as they pleased. . . .

At night we arrived at a small Seneca Indian town, at the mouth of a small river, that was called by the Indians, in the Seneca language, She-nan-jee. . . .

Having made fast to the shore, the Squaws left me in the canoe while they went to their wigwam or house in the town, and returned with a suit of Indian clothing, all new, and very clean and nice. My clothes, though whole and good when I was taken, were now torn in pieces, so that I was almost naked. They first undressed me and threw my rags into the river; then washed me clean and dressed me in the new suit they had just brought, in complete Indian style; and then led me home and seated me in the center of their wigwam.

I had been in that situation but a few minutes, before all the Squaws in the town came in to see me. I was soon surrounded by them, and they immediately set up a most dismal howling, crying bitterly, and wringing their hands in all the agonies of grief for a deceased relative. . . .

"Of our brother! Alas! He is dead—he has gone; he will never return! Friendless he died on the field of the slain, where his bones are yet lying unburied! Oh, who will mourn his sad fate? No tears dropped around him; oh no! No tears of his sisters were there! . . .

. . . His spirit has seen our distress, and sent us a helper whom with pleasure we greet. Dickewamis has come: then let us receive her with joy! She is handsome and pleasant! Oh! She is our sister, and gladly we welcome her here. In the place of our brother she stands in our tribe. With care we will guard her from trouble; and may she be happy till her spirit shall leave us."

In the course of that ceremony, from mourning they became serene—joy sparkled in their countenances, and they seemed to rejoice over me as over a long lost child. I was made welcome amongst them as a sister to the two Squaws before mentioned, and was called Dickewamis; which being interpreted, signifies a pretty girl, a handsome girl, or a pleasant, good thing. That is the name by which I have ever since been called by the Indians.

I afterwards learned that the ceremony I at the time passed through, was that of adoption. The two squaws had lost a brother in Washington's war, sometime in the year before, and in consequence of his death went up to Fort Pitt, on the day on which I arrived there, in order to receive a prisoner or an enemy's scalp, to supply their loss.

. . . If they receive a prisoner, it is at their option either to satiate their vengeance by taking his life in the most cruel manner they can conceive of; or, to receive and adopt him into the family, in the place of him whom they have lost. All the prisoners that are taken in battle and carried to the encampment or town by the Indians, are given to the bereaved families, till their number is made good.

### Olaudah Equiano's Account of His Capture and Enslavement (1757)

Olaudah Equiano, *The Life of Olaudah Equiano, or Gustavus Vassa the African Written by Himself* (London:1789; reprint, New York: Negro Universities Press, 1969)

One day, when all our people were gone to their works as usual, and only I and my dear sister were left to mind the house, two men and a woman got over our walls, and seized us both, and they stopped our mouths, and ran off with us into the nearest wood. Here they tied our hands, and continued to carry us as far as they could, till night came on, when we reached a small house, where the robbers halted for refreshment, and spent the night. We were then unbound, but were unable to take any food; and being quite overpowered by fatigue and grief, our only relief was some sleep, which allayed our misfortune for a short time. The next morning we left the house, and continued travelling all the day. . . . When we went to rest the following night they offered us some victuals; but we refused it; and the only comfort we had was in being in one another's arms all that night, and bathing each other with our tears. But alas! we were soon deprived of even the small comfort of weeping together. The next day proved a day of greater sorrow than I had yet experienced; for my sister and I were then separated, while we lay clasped in each other's arms. It was in vain that we besought them not to part us; she was torn from me, and immediately carried away, while I was left in a state of distraction not to be described. I cried and grieved continually; and for several days I did not eat anything but what they forced into my mouth. . . .

The first object which saluted my eyes when I arrived at the coast was the sea, and a slave ship, which was then riding at anchor, and waiting for its cargo. These filled me with astonishment, which was soon converted into terror when I was carried on board. . . . I was now persuaded that I had gotten into a world of bad spirits, and that they were going to kill me. Their complexions too differing so much from ours, their long hair, and the language they spoke, (which was very different from any I had ever heard) united to confirm me in this belief. . . . When I looked round the ship too and saw a large furnace of copper boiling, and a multitude of black people of every description chained

together, every one of their countenances expressing dejection and sorrow, I no longer doubted of my fate; and, quite overpowered with horror and anguish, I fell motionless on the deck and fainted. When I recovered a little I found some black people about me, who I believed were some of those who brought me on board, and had been receiving their pay; they talked to me in order to cheer me, but all in vain. I asked them if we were not to be eaten by those white men with horrible looks, red faces, and loose hair. They told me I was not. . . . Soon after this the blacks who brought me on board went off, and left me abandoned to despair. I now saw myself deprived of all chance of returning to my native country, or even the least glimpse of hope of gaining the shore, which I now considered as friendly; and I even wished for my former slavery in preference to my present situation, which was filled with horrors of every kind, still heightened by my ignorance of what I was to undergo. I was not long suffered to indulge my grief; I was soon put down under the decks, and there I received such a salutation in my nostrils as I had never experienced in my life: so that, with the loathsomeness of the stench, and crying together, I became so sick and low that I was not able to eat, nor had I the least desire to taste anything. I now wished for the last friend, death, to relieve me; but soon to my grief, two of the white men offered me eatables; and, on my refusing to eat, one of them held me fast by the hands, and laid me across I think the windlass, and tied my feet, while the other flogged me severely. I had never experienced any thing of this kind before; and although, not being used to the water, I naturally feared that element the first time I saw it, yet nevertheless, could I have got over the nettings, I would have jumped over the side, but I could not; and, besides, the crew used to watch us very closely who were not chained down to the decks, lest we should leap into the water: and I have seen some of these poor African prisoners most severely cut for attempting to do so, and hourly whipped for not eating. This indeed was often the case with myself. In a little time after, amongst the poor chained men, I found some of my own nation, which in a small degree gave ease to my mind. I inquired of these what was to be done with us; they gave me to understand we were to be carried to these white people's country to work for them. I then was a little revived, and thought, if it were no worse than working, my situation was not so desperate: but still I feared I should be put to death, the white people looked and acted, as I thought, in so savage a manner; for I had never seen among any people such instances of brutal cruelty; and this not only shewn towards us blacks, but also to some whites themselves. One white man in particular I saw, when we were permitted to be on deck, flogged so unmercifully with a large rope near the foremast that he died in consequence of it; and they tossed him over the side as they would have done a brute. This made me fear

these people the more; and I expected nothing less than to be treated in the same manner. I could not help expressing my fears and apprehensions to some of my countrymen: I asked them if these people had no country, but lived in this hollow place (ship): they told me they did not, but came from a distant one. "Then," said I, "how comes it in all our country we never heard of them?" They told me because they lived so very far off. I then asked where were their women? had they any like themselves? I was told them had "and why" said I, "do we not see them?" they answered, because they were left behind. I asked how the vessel could go? they told me they could not tell; but that there were cloths put upon the masts by the help of ropes I saw, and then the vessel went on and the white men had some spell or magic they put in the water when they liked in order to stop the vessel. I was exceedingly amazed at this account, and really thought they were spirits. I therefore wished much to be from amongst them, for I expected they would sacrifice me: but my wishes were vain. . .

At last we came in sight of the island of Barbadoes, at which the whites on board gave a great shout, and made many signs of joy to us. We did not know what to think of this; but as the vessel drew nearer we plainly saw the harbour, and other ships of different kinds and sizes; and we soon anchored amongst them off Bridge Town. Many merchants and planters now came on board, though it was in the evening. They put us in separate parcels, and examined us attentively. They also made us jump, and pointed to the land, signifying we were to go there. We thought by this we should be eaten by these ugly men as they appeared to us; and, when soon after we were all put down under the decks again, there was much dread and trembling among us, and nothing but bitter cries to be heard all the night from these apprehensions, insomuch that at last the white people got some old slaves from the land to pacify us. They told us we were not to be eaten, but to work, and were soon to go on land, where we should see many of our country people. This report eased us much; and sure enough, soon after we were landed, there came to us Africans of all languages. We were conducted immediately to the merchant's yard, where we were all pent up together like so many sheep in a fold, without regard of sex or age. As every object was new to me every thing I saw filled me with surprise. What struck me first was that the houses were built with stories, and in every other respect different from those in Africa; but I was still more astonished on seeing people on horseback. I did not know what this could mean; and indeed I thought these people were full of nothing but magical arts. . . . We were not many days in the merchant's custody before we were sold after their usual manner, which is this: On a signal given (as the beat of a drum), the buyers rush at once into the yard where the slaves are confined, and make choice of that parcel they like best. The noise and

clamour with which this is attended, and the eagerness visible in the countenances of the buyers, serve not a little to increase the apprehensions of the terrified Africans, who may well be supposed to consider them as the ministers of that destruction to which they think themselves devoted. In this manner, without scruple, I remember in the vessel in which I was brought over, in the men's apartment, there were several brothers, who, in the sale, were sold in different lots; and it was very moving on this occasion to see and hear their cries at parting. . . .

While I was thus employed by my master I was often a witness to cruelties of every kind, which were exercised on my unhappy fellow slaves. I used frequently to have different cargoes of new negroes in my care for sale; and it was almost a constant practice with our clerks, and other whites, to commit violent depredations on the chastity of the female slaves; and these I was, though with reluctance, obliged to submit to at all times, being unable to help them. When we have had some of these slaves on board my mas-

ter's vessels to carry them to other islands, or to America, I have known our mates to commit these acts most shamefully, to the disgrace, not of Christians only, but of men. I have even known them to gratify their brutal passion with females not ten years old; . . . And yet in Montserrat I have seen a negro man staked to the ground, and cut most shockingly, and then his ears cut off bit by bit, because he had been connected with a white woman who was a common prostitute: as if it were no crime in the whites to rob an innocent African girl of her virtue; but most heinous in a black man only to gratify a passion of nature, where the temptation was offered by one of a different colour, though the most abandoned woman of her species. Another negro man was half hanged, and then burnt, for attempting to poison a cruel overseer. Thus by repeated cruelties are the wretched first urged to despair, and then murdered, because they still retain so much of human nature about them as to wish to put an end to their misery, and retaliate their tyrants!

opposition to Russian control of Poland through King Stanislaw II. Although this movement crumbled in the wake of military defeat, Pulaski continued to lead periodic campaigns against the Russians. For a short time he became the nation's most venerated hero. This fame came to a crashing halt, however, when he was framed for the attempted murder of the Polish king. Stigmatized and in terrible debt from his futile military campaigns, Pulaski fled to France only to be thrown into debtors' prison. With virtually nowhere else to go, Pulaski appealed to the American revolutionaries and offered his services in the summer of 1776.

In July 1777, Pulaski arrived in North America, the beneficiary of a deal between representatives from the governments of France and the United States. Armed with a letter of introduction from BENJAMIN FRANKLIN, Pulaski met with GEORGE WASHINGTON in August. Although he had yet to receive his commission and had only volunteered to serve as an aid to Washington, he was pressed into service at the BATTLE OF BRANDYWINE (September 11, 1777). The Pole led a dramatic counterattack on the British that, at the very least, afforded time for Washington's collapsing right flank to retreat.

Pulaski also led cavalry at Haddonsfield in support of General ANTHONY WAYNE's expedition to round up cattle. After resigning in protest of having to take orders from Wayne rather than Washington, he gained reappointment in March 28, 1778, to lead Pulaski's Legion, a force composed of 68 dragoons and 200 foot soldiers. Pulaski's policy of recruiting German deserters from the British army, in violation of Washington's orders, proved disastrous. During the British raid on Little Egg Harbor (October 6–22, 1778) in southern New Jersey, one of these men defected back to the British and led a devastating attack on Pulaski's unsuspecting infantry. Fifty of his 200 infantrymen died in the night assault.

After a brief stint at the town of Minisink on the Delaware River, Pulaski was sent south to help meet the British invasion of Georgia. On May 11, 1779, during this southern campaign, Pulaski's Legion was cut to pieces by a 900-man advanced guard. Already in ill repute, Pulaski found himself involved in yet another bungled operation when the British, tipped off by a deserter, defeated the revolutionaries during their attack on Savannah on October 9, 1779.

Pulaski suffered a fatal wound that day and died en route to a hospital on the U.S. ship *Wasp*. He was buried at sea. Still a national hero in his native country, Pulaski remains a symbol of the bonds between Poland and the United States.

**Putnam, Israel (Old Put)** (1718–1790) *Continental army general*

By the beginning of the REVOLUTIONARY WAR (1775–83) Israel Putnam had established a reputation as a soldier. Born in present-day Danvers, Massachusetts, Putnam moved to Pomfret, Connecticut, where he farmed for a living. He fought in the French and Indian War (1754–63), serving in campaigns at Montreal in 1760 and the siege of Havana in 1762, before commanding Connecticut forces during PONTIAC'S WAR (1763–64) at Detroit. He was also a member of the general assembly and the SONS OF LIBERTY during the 1760s and 1770s. An outspoken critic of the British, legend has it that he immediately abandoned his farm to join the war effort after hearing about the fighting at the BATTLES OF LEXINGTON AND CONCORD (April 19, 1775). During the Revolutionary War he rose to the rank of major general in the CONTINENTAL ARMY. He played a key role in the BATTLE OF BUNKER HILL (June 17, 1775) but blundered in subsequent actions, suffering blame for losses in the BATTLE OF LONG ISLAND (August 27–30, 1776) and the capture of Fort Montgomery and Fort Clinton (October 6, 1777). Court-martialed for negligence, he was exonerated, but he had lost the faith of GEORGE WASHINGTON. In 1779 Putnam succumbed to a paralytic stroke while on leave thus bringing his military career to an end. He died 11 years later.

### **Quakers (Society of Friends)**

The revolutionary era brought challenges and opportunities to Quakers—members of the Religious Society of Friends founded in England in 1652. Advocating pacifism and withdrawal from politics, Quakers, who first came to British North America in 1656, found themselves in an awkward position during the REVOLUTIONARY WAR (1775–83), when the internecine nature of the conflict confronted every American with difficult choices. If their principles left Quakers susceptible to charges of disloyalty and even treason to the new United States, those same principles also placed them in the forefront of the reform movements of the age, especially ANTISLAVERY and ABOLITION.

Quakers in North America faced a crisis in the 1750s during the French and Indian War (1754–63). Since the beginning of the colony of Pennsylvania in the late 17th century, Quakers had played a prominent—even dominant—role in local politics. Until 1754 the Quakers had managed to hold on to their pacifist beliefs and limited their colony's participation in the wars between France and Great Britain. They could do so in part because of their willingness to make some compromises concerning their pacifism and because of the Quakers' long history of peaceful relations with NATIVE AMERICANS. The conflict that began on the Pennsylvania FRONTIER in 1754, however, was different. Indian attacks led to demands by back-country settlers that some action be taken by the colonial government. Unable to control the colony as they once had, and confronted with frontier violence, many Quakers decided that the only way for them to maintain their beliefs was by withdrawing from politics and concentrating their efforts on reforming society.

The decision to limit their political involvement left the Quakers in an awkward position in the 1760s and 1770s. During the RESISTANCE MOVEMENT (1764–75) many Quakers objected to British policies but offered only

muted protests. Some Quakers in Pennsylvania, who continued to participate in colonial politics in a limited way, did not want to complain too loudly about imperial policy because they did not want to alienate the king in the hope that the British would do away with the proprietary government and make Pennsylvania a Crown colony. For many other Quakers, noninvolvement in the controversy also stemmed from the movement begun in the 1750s to reform the Society of Friends, step away from political discourse, and focus efforts on aiding others through private means. While some Quakers participated in nonimportation movements, the sect as a whole sought to discourage its members from participating in COMMITTEES OF CORRESPONDENCE and any extralegal body that opposed royal government.

The onset of war divided the Quakers and left the reformists exposed to charges of being LOYALISTS in sympathy and action. The Philadelphia Yearly Meeting disowned almost 1,000 members for joining militias, serving in local committees, and actively supporting the revolutionary cause. By the end of the war, a separate group of expelled former Quakers organized themselves into the Free Quakers and unsuccessfully sought control of Society of Friends meetinghouses. Those who wanted to remain neutral, or had Loyalist leanings, found themselves persecuted. Arguing that the payment of taxes to support the war or participating in the revolutionary government in any way was a violation of their pacifism, Quakers found themselves distrusted by many. Revolutionary committees levied heavy fines on pacifist Quakers, and when they did not pay, seized Quaker property by force. When Quakers crossed enemy lines for business or to attend their quarterly and yearly meetings, they provoked further animosity. Likewise, the Quakers sought to live under any government that was in place. If a British army occupied a city, the Quakers went about their business; if the CONTINENTAL ARMY occupied the same location, the Quakers

attempted to live as they had under the British. In a brutal and long war, neutrality became increasingly difficult to maintain. In 1777 and 1778 the revolutionary government of Pennsylvania arrested 17 leading Quakers and sent them to harsh imprisonment in Winchester, Virginia. Two elderly and infirm Quakers died during the incarceration; a third died a year later, having never fully recovered from his confinement. Besides loss of civil rights, Quakers also occasionally suffered mob harassment when crowds broke the windows of Quaker property and threatened further action.

If some Quakers suffered during the Revolutionary War, they also demonstrated an increasing commitment to reform. Since the 1750s Quakers had steadily moved against SLAVERY. By 1774 Philadelphia Quakers resolved to disown any member who refused to manumit his slaves. Quakers helped to organize manumission societies and supported legal action by state governments against slavery. In the 1790s Quakers petitioned Congress to end the slave trade and were in the forefront of the movement to abolish slavery. Quakers also reached out to Native Americans, sending missionaries to groups such as the Seneca in the 1780s and 1790s. Quakers became active in other areas of reform, including supporting changes in punishment of criminals and seeking ways to help the poor. Although Quakers in the early republic no longer played a prominent role in politics, their involvement in philanthropy helped to mold the future course of HUMANITARIANISM in the United States.

### **Quartering Act (1765)**

As a part of the effort to reorganize the British Empire, including the revenue bills called the SUGAR ACT (1764) and the STAMP ACT (1765), Parliament passed the Quartering Act on May 3, 1765, to guarantee housing and supplies for troops stationed in colonial America. Although the act contributed to the tension created by the imperial crisis, it was not as offensive nor as onerous as the revenue regulations. In fact, BENJAMIN FRANKLIN, as a colonial agent in London, helped to write the final wording of the law. The Quartering Act had two key provisions. First, the law stipulated that the colony in which the troops were stationed had to find billeting in vacant buildings or barracks. This clause was considered a major concession to colonial Americans because it did not allow for the housing of soldiers in private houses. It also created problems for the British army since it made it difficult to find hous-

ing for soldiers on the march. The second key provision, connected to the first, was that the act depended upon the colonial legislature to raise the money to support the soldiers. In essence, this clause gave the colony local control. There was no taxation without representation here. On the surface, it also made it appear easy to oppose the measure; a colonial assembly could nullify the law by refusing to fund the billeting of the troops.

Most colonies, however, complied with the law. When New York did not do so, it faced parliamentary wrath. In reaction to the New York assembly's noncompliance, Parliament enacted a law that prevented the assembly from passing any legislation until it met its obligations under the Quartering Act. New York's opposition to the Quartering Act also helped to convince Parliament to pass the TOWNSHEND DUTIES (1767). The New York assembly compromised and provided some money for British troops before the New York Suspending Act (July 2, 1767) was to go into effect.

Parliament renewed the Quartering Act several times during the 1760s and 1770s, since it always had an expiration date attached. In 1774 a slightly stiffer measure was added in reaction to the BOSTON TEA PARTY (1773)—and as part of the COERCIVE ACTS (1774)—indicating that the troop commander had the right to locate his troops geographically. The idea here was to prevent an assembly from offering to pay for quartering troops at a location away from where British officials believed they needed to have the troops stationed.

### **Quasi-War (1798–1800)**

The United States fought an undeclared naval war with France, that is referred to as the Quasi-War (1798–1800). The diplomatic rift began in 1796. France viewed JAY'S TREATY (1794), which gave Great Britain most favored nation trading status, as a repudiation of its treaties of commerce and alliance (1778) with the United States. In addition, victories in the WEST INDIES strengthened the French position in the Caribbean. In the spring of 1796, French privateers (see also PRIVATEERING) and warships began to seize U.S. shipping in the West Indies. This policy was made official by a French decree on July 2, 1796. Soon the French were even cruising off the coast of North America. Within two years more than 330 vessels from the United States were captured, driving INSURANCE

rates from less than 6 percent to as high as 40 percent. At such rates, shipping was crippled. Efforts at negotiating a settlement ended in disaster when the French refused to begin discussion until the United States paid a bribe. After this so-called XYZ AFFAIR (1797–98), hope for a peaceful settlement disappeared. Clamoring “millions for defense and not one cent for tribute,” the United States prepared for war by expanding the army and creating a navy.

Fortunately for the United States, the construction of three frigates—the *Constellation*, the *United States*, and the *CONSTITUTION*—was almost complete after four years of work. Launched in the summer of 1798 these ships added some real punch to a newly organized naval department under Benjamin Stoddert. Other frigates and warships began to be built, and merchantmen were bought and converted to naval purposes. As early as July 7, 1798, when the newly commissioned *Delaware* captured the *Croyable* off the coast of New Jersey, United States vessels began to strike back. While naval action could not drive every privateer from the sea, the United States was able to punish France for the depredations. Two frigate size actions were also fought, both by the *Constellation*. On February 9, 1799, the *Constellation* met *L'Insurgente* off the island of Nevis and pounded it into surrender. Near Guadeloupe almost a year later, on February 1, 1800, the *Constellation* met a superior *La Vengeance* in an indecisive action that left both ships severely damaged—the Americans claimed that had *La Vengeance* not veered off in the dark of night they would have captured or sunk the French ship.

The Quasi-War had a dramatic impact within the United States. Riding a wave of war fever, the FEDERALIST PARTY gained in popularity over the DEMOCRATIC-REPUBLICAN PARTY. The Federalist Party then passed the ALIEN AND SEDITION ACTS (1798) to limit immigrant voting and stifle the opposition press. The navy and larger army needed money. The Federalist Party increased taxes, leading to FRIES'S REBELLION (1799) in Pennsylvania. But the momentum could not be sustained, especially when President JOHN ADAMS opted to avoid outright war and reopened negotiations. The peace commissioners sent by Adams found that conditions in France had shifted, and that with the rise of NAPOLEON BONAPARTE, a settlement was possible. The result was the Convention of 1800. This peace accord was not a diplomatic triumph. The French refused to pay any reparations for the seizures during the conflict and they insisted on equal trading status with Great Britain. For the time being, however, they recognized neutral rights of the United States and they stopped capturing merchant vessels. Perhaps most importantly, Napoleon agreed that

the FRENCH ALLIANCE (1778) with the United States no longer existed. The Senate initially balked at these terms as conceding almost nothing, but eventually ratified the treaty. Napoleon's true aims remained hidden. Within days of his acceptance of the treaty, he had forced Spain to retrocede the Louisiana Territory to France and began dreaming of a French-American empire. The French failure to reconquer Saint Domingue (HAITI) forced Napoleon to abandon these dreams in 1803 and agree to the LOUISIANA PURCHASE.

### Quebec, Battle of (Québec) (December 31, 1775)

In an effort to drive the British out of North America entirely, the revolutionaries launched a two-pronged invasion of CANADA in the summer and fall of 1775. One prong, led by General RICHARD MONTGOMERY, attacked from New York and captured St. John's and Montreal. The other, headed by BENEDICT ARNOLD, had a difficult march through the Maine wilderness. Both expeditions started late in the campaign year. Arnold's forces had to cross swollen streams, deal with rainstorms and snow, and managed to get to the St. Lawrence River only by November 9. More than one-third of his troops turned back. In early December, Arnold's 675 men were joined by Montgomery with about 300 men. They faced almost twice that many defenders in Quebec. Since many of the enlistments were about to expire with the coming of the new year, Montgomery and Arnold led an assault during a blizzard on December 31. Although the attack demonstrated daring and bravery, it was also foolhardy. Montgomery was killed almost as soon as the battle began; Arnold suffered a serious wound to his leg. The revolutionaries were beaten back and about 400 were taken prisoner. A small force remained to besiege the city, with some reinforcements added before spring. But with the thaw, British ships sailed up the unfrozen St. Lawrence. The revolutionaries pulled back to Montreal, then retreated further to FORT TICONDEROGA, almost in complete rout. Although the campaign was a disaster, it demonstrated the ardor that some Americans had for their Revolution. Montgomery's death before Quebec, mirroring the great British hero General James Wolfe's death in 1759, became an important symbol for the cause of independence, and Montgomery was held up as a martyr.

Death of General Richard Montgomery during the Battle of Quebec. Engraving (Library of Congress)

### Quincy, Josiah (1744–1775) lawyer, writer

Josiah Quincy was an important leader in the events before the REVOLUTIONARY WAR (1775–83). Born in Boston, Massachusetts, on February 23, 1744, to Josiah and Hannah Sturgis Quincy, when he was 12 he moved with his family to Braintree, Massachusetts. After completing his B.A. in 1763 and his M.A. in 1766 at Harvard, he began practicing law in Boston and quickly rose to the top of his profession. On October 26, 1769, Quincy married Abigail Phillips and eventually fathered two children.

In 1770 the young and ambitious Quincy joined with JOHN ADAMS in defending the British soldiers on trial for murder in what came to be called the BOSTON MASSACRE (March 5, 1770). Despite the concerns of his patriot father, who was flabbergasted by his son's involvement, Quincy's reputation grew even more after he and Adams successfully defended the British soldiers. In 1772 Quincy was appointed to the COMMITTEE OF CORRESPONDENCE, and in 1773 he began traveling extensively to meet with officials about the perceived English threat to local rights and liberty. In addition to his skills as a lawyer and orator, Quincy was also a gifted writer and authored several essays

decrying British imperial measures. He became one of the most vocal critics of Massachusetts governor THOMAS HUTCHINSON and wrote a defense of the BOSTON TEA PARTY (December 16, 1773) in the *Boston Gazette*. His most influential work was *Observations of the Act of Parliament Commonly Called the Boston Port Bill with Thoughts on Civil Society and Standing Armies* (1774).

Quincy's life proved to be brief, and he died on April 26, 1775 from tuberculosis. Unbeknownst to him, his infant daughter had passed away just two weeks earlier, leaving his wife with only their son, also named Josiah Quincy, who went on to have a long and distinguished political career.

### Quok Walker Case

The Quok Walker Case, often cited as abolishing SLAVERY in Massachusetts, was actually a series of cases in which the

final outcome was not as definitive as commonly believed. Quok Walker was a slave who had run away from his master Nathaniel Jennison in Barre, Massachusetts. In 1781 Jennison found Walker working as a farm laborer for John and Seth Caldwell. Jennison went to claim his slave, beat him, and forcefully brought him home. Walker sued Jennison for assault and battery in Worcester Court of Common Pleas, asserting that he was not a slave since he had been promised his freedom upon turning 25. The court decided that Walker was “a Freeman and not the proper Negro slave” and awarded £50 damages.

Subsequently, Jennison sued the Caldwells for enticing Walker away from him, and in contrast to the first judgment, the Worcester Court of Common Pleas ruled in Jennison’s favor and awarded him damages. No explanation for these contradictory decisions was recorded. In September 1781 both decisions were appealed to the state supreme court. The court decided against Jennison in the Walker case, since Jennison’s lawyers failed to file the appropriate paperwork, and then overturned the decision in *Caldwell v. Jennison*, ruling that the Caldwells had every right to employ Walker since he was free. However, there is no record as to the reasoning in the decision. It could have been that the jury—who made the final judg-

ment in the case—had decided that Walker was free based on earlier promises by his master or that he was free because slavery was illegal under the Massachusetts constitution of 1780.

Although there was no written record of the arguments in the case or the reasoning of the jury—nor is there conclusive evidence that, after this case, slavery ended in Massachusetts—an important precedent had been set, and other cases in Massachusetts against escaped slaves were subsequently dropped. Thus, the Quok Walker case marks an important milepost in the ABOLITION of slavery in the United States.

A third Quok Walker case was brought in civil court charging Jennison with an assault and battery on Walker, which was not heard until April 1783. This case, too, is significant because in his charge to the jury, Judge William Cushing—who was only one of five judges listening to the case—declared that slavery was unconstitutional since it violated the state’s “Declaration of Rights,” which proclaimed that “All men are born free and equal.”

### race and racial conflict

European Americans held race as an important element distinguishing one social group from another in the revolutionary and early national periods. Throughout this era, there were three major races identified in North America. There were European Americans or whites, NATIVE AMERICANS or Indians, and AFRICAN AMERICANS or “Negroes.” Most European Americans assumed an attitude of racial superiority over the other two races and enforced their ideas through war and repression.

Ideas concerning Native Americans during the late colonial and early national periods reflected a mixture of nearly 200 years of contact and the ideals of the Enlightenment. On the one hand, years of conflict convinced many European Americans that Indians were savages who needed to be exterminated. On the other hand, based on the laws of nature and reason that emphasized different stages of cultural development, some European Americans believed that Native Americans were primitives who clung to a simpler form of life centered on hunting and gathering. Neither approach reflected the reality of the Native Americans living east of the Mississippi River. Those European Americans who emphasized the need to kill Indians as unregenerate heathens and obstacles to progress ignored the fact that the warring Native Americans were defending their land from invaders. They also turned a blind eye to the thousands of Indians who accommodated European-American society by accepting Christianity and adopting many European-American cultural traits. Those European Americans influenced by the Enlightenment were also wrong-headed because they persisted in looking upon Indians as some less civilized group and created a mythology that the Native American relied almost entirely upon hunting and gathering. Since women did most of the labor in AGRICULTURE, European Americans did not think that farming was important to Indians. This position led a few philanthropists to argue that the Indians should be either converted to the ways of “civilization” or removed for their

own safety from contact with the European Americans. Ultimately these ideas led to the removal policies of the Jacksonian period.

European-American attitudes toward African Americans, although challenged in the period, were less mixed. In 1761 most African Americans were slaves. Rationales existed for enslaving Africans—running the gamut from the belief in racial inferiority to the idea that slaves were captives in war—but not many European Americans worried enough about explaining the institution of SLAVERY to fully develop such ideas. The AMERICAN REVOLUTION changed the situation by emphasizing the ideal of liberty and leading to the freedom of tens of thousands of slaves. It now became necessary to articulate a more elaborate rationale for defending racial slavery. Although men such as THOMAS JEFFERSON had held that Africans did not have the same intellectual capacities as European Americans, it was only in the early 19th century that white Americans, especially in the South, developed extensive scientific arguments for racial differences.

The Enlightenment also had an impact on ideas about race concerning African Americans. About the middle of the 18th century, following the new emphasis on SCIENCE embedded in the Enlightenment, an increasing number of slaveholders began to accept the humanity of their African-American slaves. However, this insight did not inevitably lead to ideas of emancipation. Instead, European Americans began to talk about the burden of owning slaves, and slave owners came to rely increasingly on subtle manipulation of the humanity of African Americans to control their slaves. Simultaneously, this new recognition did begin to challenge slavery in two ways. First, an increasing number of European Americans came to recognize the inhumanity of the international SLAVE TRADE, leading to its official termination in 1808. Second, some people began to argue for the equality of all mankind, black and white. In particular, free African Americans seized upon the rhetoric of the American Revolution and turned it against the racist ideas

of European Americans. Some whites also began to speak of the equality of all humans.

Racial conflict between white and black Americans assumed a variety of forms. The institution of slavery represented a type of racial conflict, since European-American masters ultimately relied upon violence in order to subjugate slaves. African-American slaves turned to intermittent violence—destruction of property, physical attacks, and occasional rebellion—to resist slavery. However, even in northern states, where slavery was abolished or was in the process of being abolished, racism existed. White Americans occasionally used collective action to attack African Americans and their developing institutions.

**Randolph, Edmund** (1753–1813) *Constitutional Convention delegate, attorney general, secretary of state* Edmund Randolph was born into a wealthy Virginia planter family and became an important leader in the AMERICAN REVOLUTION. Randolph studied at the College of William and Mary. When the REVOLUTIONARY WAR (1775–83) broke out, father and son were torn apart by their opposing political views concerning the future of the colonies. Edmund's father, John Randolph, remained loyal to the Crown and followed the royal governor, JOHN MURRAY, LORD DUNMORE, to England in 1776. But his son Edmund embraced the revolutionary cause and served as an aide-de-camp to General GEORGE WASHINGTON. Only 23 years old, Randolph became the youngest delegate in Virginia, and he emerged as an ardent supporter of the adoption of Virginia's first state constitution in 1776 (see also CONSTITUTIONS, STATE).

During the war Randolph continued to pursue an ambitious political career. He first became mayor of Williamsburg and then Virginia's attorney general. In 1779 he attended the SECOND CONTINENTAL CONGRESS and was elected governor of Virginia in 1785. His great moment in U.S. history came when Randolph, the leader of the Vir-

ginia delegation, submitted the so-called Virginia Plan to the CONSTITUTIONAL CONVENTION in Philadelphia in 1787. This bold plan called for the annulment of the ARTICLES OF CONFEDERATION and the creation of an entirely new constitution. The Virginia Plan proposed a strong central government with separate legislative, executive, and judicial branches. The plan also called for a bicameral Congress with the lower house (House of Representatives) elected by the people and an upper house (Senate) chosen by the lower house from nominees proposed by the state legislatures. After three days of furious debate and revision, the Virginia Plan became the basis of the UNITED STATES CONSTITUTION.

By the time the Constitution was adopted, Randolph ironically declined to sign it because he worried about the increased power of the presidential office, which he saw as a "foetus of monarchy." When the Constitution was submitted to the Virginia convention, Randolph, however, urged the delegates to approve the document to prevent a breakup of the United States into a loose confederation. Under President Washington, Edmund Randolph became the attorney general of the United States, and he succeeded THOMAS JEFFERSON as secretary of state in 1794. The next year, the British minister to the United States released French diplomatic papers that falsely accused Randolph of seeking bribes from foreign diplomats for giving secret information. The compromised Randolph resigned from public office the same year and his political career never recovered from this denunciation. He resumed his law practice but returned once again to the public arena when he became AARON BURR's major legal counsel in his trial for treason in 1807. Randolph's name was completely cleared after his death in 1813.

—Dirk Voss

**Randolph, John** (1773–1833) *representative, senator* John Randolph was an independent-minded member of the DEMOCRATIC-REPUBLICAN PARTY. He was born on June 2, 1773, in Prince George County, Virginia. His formal EDUCATION was sporadic, including stints at Princeton, Columbia, and William and Mary, none of which produced a completed degree. With the death of his mother in 1787, and his brothers in the 1790s (Randolph's father died in 1775), he settled down to manage the family estate. By 1799 he entered politics as a Democratic-Republican and a supporter of THOMAS JEFFERSON.

With Jefferson's election in 1800, Randolph exercised considerable power in Congress. He served as chair of the important Ways and Means Committee. He set aside his growing concern over centralized federal power to help Jefferson accomplish the LOUISIANA PURCHASE (1803).

Randolph believed in a strict constructionist, STATES' RIGHTS interpretation of the UNITED STATES CONSTITUTION. He distrusted the modernizing democracy of early 19th-century America. He once said, "I am an aristocrat. . . . I love liberty; I hate equality." Randolph's political inflexibility would characterize his political career. Paradoxically, he grew to oppose Jefferson the man, while espousing what he believed were the true, and betrayed, Jeffersonian principles.

Yet Randolph did not limit his opposition to Jefferson. He challenged JAMES MADISON and James Monroe, even as he attacked the FEDERALIST PARTY. Speaking before Congress in 1806, Randolph declared himself a *tertium quid*, which is to say someone who cannot be defined. He led a failed attempt to impeach Justice SAMUEL CHASE; the bungled case caused lasting damage to Randolph's reputation. He opposed the Democratic-Republican administration's position on the YAZOO CLAIMS and the purchase of FLORIDA.

Randolph had been plagued by health problems his whole life, but in his later years heavy drinking and opium use accelerated the physical decline. He died on May 24, 1833. Even in death, Randolph proved defiant of convention. He was buried facing west, purportedly so he could "keep an eye on Henry Clay."

### Red Bank, Battle of (October 22, 1777)

As a part of his effort to clear the DELAWARE RIVER FORTS to allow water-borne supplies to reach his army in Philadelphia, General WILLIAM HOWE ordered 1,500 HESSIANS, under Colonel Karl Emit Kurt Von Donop, to seize Fort Mercer near Red Bank, New Jersey. Von Donop underestimated the tenacity of the 600 Continentals under Colonel Christopher Greene defending Fort Mercer. The revolutionaries had dug trenches, set up abatis, built parapets, and created a formidable fortress. Recognizing that the initial fortifications were too expansive for the number of men he had available, Greene had also built an inner wall on the northern side of the fort. Expecting to overrun the revolutionaries, Von Donop attacked from three sides. He led the assault on the north face, clamored over the outer wall, only to discover the Continentals defending the inner wall. The space between the two lines of defense became a

killing ground for the Hessians as they were mowed down by Greene's protected troops. Von Donop was mortally wounded and his men soon scrambled back across the outer wall in retreat. The attacks on the other two sides did not fare any better, as the defensive position proved too strong. The Hessians lost 400 men killed and wounded; the revolutionaries had 14 killed and 23 wounded. A month later the CONTINENTAL ARMY had to abandon Fort Mercer after the British pounded nearby Fort Mifflin into ruins.

**Further reading:** Stephen R. Taaffe, *The Philadelphia Campaign, 1777–1778* (Lawrence: University of Kansas Press, 2003).

### Red Jacket (Sagoyewatha) (1750?–1830) Iroquois League spokesman and diplomat

After the REVOLUTIONARY WAR (1775–83), Red Jacket led the diplomatic struggle to keep the young United States from swallowing all of the IROQUOIS territory. His arguments for resisting the ever-increasing pressure of the settlers were heard in numerous tribal conferences at the close of the 18th century.

Red Jacket first appeared in historical records as a courier for the British during the Revolutionary War. A British officer took a liking to the young man and gave him a red coat as a gift. Through the years, Sagoyewatha acquired similar coats and made them his trademark. He defended his homeland against the CONTINENTAL ARMY led by General JOHN SULLIVAN in 1779. There is little information to distinguish him as a warrior. Red Jacket said that he considered himself an orator and not much of a fighter. He was reputed to be physically weak.

After the war, the state of New York was anxious to exert its authority over the western counties that made up the Iroquois Nation. Massachusetts claimed this same region as its own. Without a strong central government to resolve the disputes, New Yorkers decided the best way to solve the problem was to "extinguish" the property rights of the NATIVE AMERICANS there.

The Treaty of Fort Stanwix (1784) was the first of the postwar agreements that whittled down the Iroquois holdings. Many of the Six Nations fled to CANADA, where the British gave them land. Red Jacket wanted to stay in his own country and did not want to sell any of it to the whites. He spoke out at Fort Stanwix and later at Buffalo Creek (1788) and Geneseo (1797). At each of these conferences he tried to persuade the Iroquois not to part with any more land. Each time he lost.

Red Jacket thought that the Iroquois should protect their homes by force. He wanted the Six Nations to join the Miami confederacy and defended his views at the multitribal MEETING AT THE GLAIZE. CORNPLANTER, another

Red Jacket. Painting by Charles Bird King (*Library of Congress*)

Iroquois leader, thwarted his efforts. The Miami Confederation suffered a defeat at the **BATTLE OF FALLEN TIMBERS** (August 20, 1794) and soon broke up. Cornplanter and Red Jacket argued at several more council fires over the fate of the Iroquois land. Red Jacket always refused to sell more land. Cornplanter, on the other hand, believed that the Iroquois needed to face what he thought was the inevitable, arguing that the Iroquois had to get the best deal they could while the Iroquois were still strong.

By the War of 1812 (1812–15), the Iroquois held only a tiny reservation in New York State out of what was once a vast empire. Red Jacket, who was too old to fight, decided that it was best to side with the United States and helped to raise Iroquois warriors to fight against the British. Many of these Indians fought for the United States in the Battle of the Chippewa (July 5, 1814). For his efforts, the government made Red Jacket a lieutenant and awarded him a pension.

## religion

Between 1761 and 1812, religion in what became the United States underwent a great transformation in the wake of the **AMERICAN REVOLUTION**. The Revolution freed individuals to make their own decisions concerning religious affiliation. For many ordinary people, this freedom was novel and exciting. In response, ministers learned to use new persuasive techniques to convince people to join their churches. This combination of freedom and persuasion proved very effective, and by 1812 more people in the United States had joined churches than ever before.

During the colonial period, religious diversity differed greatly from colony to colony. The middle colonies—Pennsylvania, New York, and New Jersey—were the most diverse. In each of these colonies, Presbyterians, BAPTISTS, Anglicans, and QUAKERS shared the stage with various other religious and ethnic groups, the most notable being German pietists. The southern colonies were also diverse, but less so. The **ANGLICAN CHURCH** was publicly supported, but the growth of active Presbyterian and Baptist populations increasingly threatened Virginia's Anglicans. Moreover, southern colonies had fewer religious institutions than their counterparts in the North. In New England, the Congregational church remained supported by local taxes. Most churchgoers belonged to the Congregational church, although there were significant populations of Quakers and Baptists.

In the middle of the 18th century, a revival now known as the First Great Awakening divided churches between New and Old Light congregations. These divisions affected Calvinist churches most deeply, and were inspired in part by the English preacher George Whitefield. Whitefield first came to North America in 1739 and introduced a more enthusiastic form of religion, gathering people into large groups and using emotional language to convince them to accept their dependence upon God. Similarly, Gilbert Tennent, a famous Presbyterian New Light minister, warned against the “danger of an unconverted ministry” in his 1740 sermon of the same name. Tennent believed that many Calvinist ministers were more interested in worldly ends than in bringing salvation to ordinary people. Despite their divisions, both New and Old Light churches remained committed to the central tenets of Calvinism, including predestination and salvation by God's irresistible grace. As Tennent suggested, New Lights hoped to re-invigorate Calvinism by purifying it from any worldly influence.

Historians have sought to connect the divisions caused by the Great Awakening to the American Revolution. The causal relationship between the two events, however, remains uncertain. For starters, many of the founding fathers were more concerned with the political ideas of the Enlightenment than with religion, and some, such as **THOMAS JEFFERSON** and **JOHN ADAMS**, leaned toward

DEISM. The UNITED STATES CONSTITUTION itself makes no mention of God, except in the First Amendment. The First Amendment, however, was added to appease the Constitution's opponents, who worried that Congress might threaten RELIGIOUS LIBERTY. Moreover, it is important to note that the First Amendment applied only to Congress's powers over religion, not to the states. (Seven states maintained some aid to religion when the First Amendment was ratified.) On the other hand, New England ministers were central to securing popular support for the revolutionary cause. Most Americans, after all, organized their beliefs according to religion and not the Enlightenment. Many ministers worried that efforts to expand the Church of England (Anglicanism) in New England threatened their religious autonomy. For these ministers, Anglicanism was as serious a threat to the colonies as the political machinations of king and Parliament. The Revolution took its toll on Anglicanism even in strongholds such as Virginia. Although most elite Virginians remained members of the Anglican church, the Revolution provided an opportunity for Baptists and other dissenters to vocalize their hostilities toward paying church taxes. Moreover, many Anglican ministers remained loyal to England and fled during the war. These two forces combined created a vacuum that new religious movements would fill.

Following the REVOLUTIONARY WAR (1775–83), each state guaranteed religious liberty to its citizens. In doing so, they cleared the space for the dramatic growth of new sects, such as Baptists, METHODISTS and Universalists, none of whom had been major forces during the colonial period. In the absence of state support, religions developed the organizational structures that we now associate with denominationalism, including central committees and independent colleges. Denominationalism was a uniquely American invention, allowing each religious community to support its own institutions independent of the state. Moreover, the development of denominations enabled each religious group to control their own populations across the extended space of an expanding United States.

In the immediate post-revolutionary years, however, Methodists and Baptists benefited less from their nascent denominational structures than from their status as outsiders. Baptists were actually the least denominationally inclined of the primary religious sects. They strongly believed that each church should be locally governed. This localism was a great asset to the democratic-minded people of the United States who sought to wrest control of their religious lives from established authorities. Methodism, on the other hand, was more centrally organized, but its theology embraced many aspects of popular religion, including supernaturalism and enthusiasm. Methodism's success had much to do with its openness to the religious beliefs of ordinary people. In addition, the educational and social

backgrounds of Methodist, Baptist and Universalist ministers were often much closer to those of ordinary people than the well-educated Presbyterians, Congregationalists and Anglicans. By the middle of the 19th century, Methodists and Baptists would become the largest Protestant denominations in the country. In 1780 there were 400 Baptist and about 50 Methodist congregations; by 1820, Baptists and Methodists had about 2,700 congregations each. After 1820 these numbers would rise even faster.

In the South, Methodists welcomed free and enslaved AFRICAN AMERICANS to join their churches, making great inroads among this group in the post-revolutionary decades. Nonetheless, many white Methodists remained uncomfortable with the intermingling of races in worship, especially when African Americans brought their own spiritual traditions into Methodist churches. In 1816 African Americans established their own church, the African Methodist Episcopal Church. In part, the success of Methodists among black Americans was due to parallels between Methodist enthusiasm and African-American spiritual traditions. The Christianizing of the South's African-American population during this period was an important development in the larger history of religion in the United States.

In the West, the ramifications of the Revolution can be seen most clearly. Following the Revolutionary War, thousands of settlers moved westward into New York, Vermont, and the Ohio Valley. While many brought their religious beliefs with them, the lack of existing institutions or a legal

Many battle flags of the American Revolution carried religious inscriptions. (*Library of Congress*)

establishment made settlers open game for Congregationalists, Presbyterians, Methodists, Baptists, and other denominations competing for members. The result was a veritable battle for converts. Denominations established missionary societies in the East to send ministers and money to the FRONTIER. The battle for the West spurred denominations to organize more effectively, giving shape to the diverse, voluntary character of religion in the United States.

The most successful western preachers employed emotional language and hosted large revivals during which many anxious souls could be converted. This Second Great Awakening, which in many ways was merely a continuation of the First Great Awakening, created great outbursts of religiosity, which churches and voluntary associations channeled into denominational growth. The most famous revival took place in August 1801 in Cane Ridge, Kentucky (see also CAMP MEETINGS). More than 10,000 persons were converted during a span of six intense days. To conservative eastern Presbyterians and Congregationalists, revivals posed a serious threat to Calvinism. Calvinists struggled to hold on to their predestinarian creed and argued that western enthusiasts confused intensity of experience with the presence of divine grace. New Englanders, especially debated the role of individuals in bringing about their own salvation, continuing conflicts that began during the First Great Awakening. Methodists understood, however, that on the frontier, individuals were in charge of their own religious choices. In the absence of an establishment, people would no longer defer to clerical authority. Despite their initial resistance, most Presbyterians and Congregationalists, such as the theologian Nathaniel Taylor, came to accept a greater role for the individual.

The combination of revivals, the growth of new denominations and the desire of ordinary people to choose which church they joined resulted in tremendous growth for religious institutions. By 1815 Americans founded and attended more churches than ever before in their history. Success, however, led to millennial thinking. People started to believe that the United States was paving the way for the second coming of Christ. Protestants established Bible, tract, and missionary societies to spread the Gospel to all Americans. Millennial beliefs allowed many people to conflate the purpose of the nation and of Protestantism. The tendency to combine religious and national identity led to deep conflicts. To many in the North, the continuation of SLAVERY in the South was a gross violation of church doctrine. Northern Protestants also worried that CATHOLICS immigrating from Ireland would threaten their millennial hopes. In the early 19th century, anti-Catholicism was a central element of American Protestantism. In time, the belief that the United States was God's nation would legitimate the nation's imperial expansion across the continent.

### religious liberty

Since the Glorious Revolution in 1689, all Britons had been guaranteed religious liberty. Religious liberty in the 17th century, however, meant something very different than it did after the AMERICAN REVOLUTION, or today. For the most part, the goal of religious liberty was to limit social conflict. In Great Britain and in the colonies, office-holding could still be denied to persons of different faiths, most notably CATHOLICS and JEWS. Moreover, an established church was not seen as a violation of religious liberty. In England, the king and queen remained the heads of the ANGLICAN CHURCH. Similar institutions existed in colonial America as well. In New England, each colony had a tax-supported church. In the South, the Anglican Church was also publicly supported. The only area in the British Empire that embraced religious diversity during the colonial era was the middle Atlantic. With the exception of the region surrounding New York City, neither New York, New Jersey, nor Pennsylvania had a state-sponsored church. Pennsylvania's founder, William Penn, was a QUAKER who believed strongly in the separation of church and state. Even more important, all three colonies had extremely diverse religious populations, including Quakers, Presbyterians, Lutherans, and Anglicans. New York had been settled originally by the Dutch, and Dutch Protestant churches remained prominent. On the eve of the REVOLUTIONARY WAR (1775–83), one-third of Pennsylvania's population was composed of German immigrants. In such an environment, it was impossible to establish any particular RELIGION.

Despite this diversity, residents of the middle colonies did not share our modern notion of religious liberty. Although they accepted religious diversity, most churchgoers never exercised choice about their religious affiliations. Instead, people were usually born into a church and belonged to it for the rest of their lives. Their notion of religion was similar to the way we think about ethnicity today. The one major exception was the divisions inspired by the First Great Awakening in the middle of the 18th century. During the Great Awakening, churches split over doctrine and preach-

ing styles. Many dissenters established their own churches. But the Great Awakening was deeply divisive because most churchgoers did not believe that ordinary individuals should be allowed to form their own churches. Instead, they considered the splitting of congregations abhorrent, and many divided churches strove to re-create unity.

Ideas about religious liberty were deeply affected by the Revolution. In Virginia, BAPTISTS, Presbyterians and others were frustrated by the Anglican Church's official monopoly, and they supported disestablishment. THOMAS JEFFERSON actively feared the ministry, believing that ministers used religion to pursue their own interests over those of the people. Jefferson wrote the now famous "Statute of Religious Freedom," passed in 1786 by the Virginia legislature. In the statute, Jefferson proclaimed that the state ought to play no part in religious affairs. Jefferson's goal was to free the state from religion, and he believed that most people once freed from a religious establishment would embrace DEISM. But for ordinary Virginians, the statute enabled them to choose their own religious affiliations, and many decided to become evangelicals. Jefferson's statute,

then, did not accomplish his goals. Rather than diluting the role of religion in public life, the statute allowed ordinary people to become more active in their own religious destinies, and thus to strengthen the place of religion in the public sphere.

In New England, disestablishment was not as easily won. In Connecticut, Massachusetts, and New Hampshire, the clergy of the Congregational Church joined ranks with the FEDERALIST PARTY to maintain the establishment. Outsiders, such as Baptists, Universalists, and METHODISTS, had to struggle to earn legal recognition of their own churches. After 1800 these dissenters joined the DEMOCRATIC-REPUBLICAN PARTY (Jeffersonians) to challenge the Federalist Party–Congregational alliance. In 1811 in Massachusetts, Jeffersonians passed the Religious Freedom Act, granting all churches the same rights and seriously undermining the established church. In New Hampshire, Jeffersonians ended public support of religion in 1819. In Connecticut, conflict between the established ministry and Democratic-Republican dissenters was particularly intense. Connecticut's ministers struggled to retain control over the

The first prayer in Congress illustrates the complex relationship of religion and government in the United States. (Billy Graham Center Museum)

state's religious life, but they were eventually outnumbered by dissenters and, in 1818, the church was disestablished.

The First Amendment of the UNITED STATES CONSTITUTION did not end state-supported religion in the United States. Instead, it eased fears among ANTI-FEDERALISTS that the new federal government would use its power to favor one religion over another at the national level. The establishment clause specifically prevented Congress from interfering with religious affairs, but it applied solely to Congress and not to the states. As seen above, most New England states maintained tax support for the Congregational Church well into the 19th century. While today we think of the First Amendment as protecting us from any state or federal support of religion, in the early republican era it also protected the rights of states to support the church of their choice.

The battle over disestablishment concerned the role of religion in society. To members of the Federalist Party, the established church was the most effective means of providing all citizens with moral EDUCATION. They feared that without an established church, citizens would lack the virtue necessary to live in a free society. Jeffersonians, joined by Baptists and other dissenters, suggested that voluntary religion was more effective at gaining adherents and teaching morality. Few Democratic-Republicans in New England accepted Jefferson's assertion that religion was a threat to the state. Instead, they believed that people were more inclined to support religion when they did so of their own free will. According to a delegate to Massachusetts's 1820 constitutional convention, religion would "be best promoted, by recognizing the inalienable right of every man to render that worship in the mode most consistent with the dictates of his own conscience." Disestablishment in New England, unlike in Virginia, was intended to increase the effectiveness of churches while accommodating the right and desire of people to choose their own religious affiliations.

By the second decade of the 19th century, most people in the United States faced new choices in their religious lives. Competing denominations arose in the place of the establishment, each with its own theology and its own benefits. With the growth of Baptists, Methodists, and other denominations, all of the United States became as diverse as the middle Atlantic. In all states, choice became the defining essence of religious liberty. No longer could a denomination take itself for granted; instead, each would have to struggle continuously to gain new adherents. Religious liberty did not lead to the demise of religion, but it made religious affiliations purely voluntary.

## republicanism

Republicanism is the word historians use to describe the ideology of the American revolutionaries. The term derives from the Latin phrase *res publica*, which means the public thing or the commonwealth. Today we define a republic as any form of representative government. In the 18th century, at least before the independence of the United States, a republic could be any government for the common good. It was thus possible to have a monarchy that, since the king was guardian of the public good, was a republic. From this perspective the ideal form of government was one in which there existed a balance between various elements in society: the one (monarch); the few (aristocrats); and the many (the demos, or the people). In theory, the English government of the 18th century could be considered a republic because the king represented one element of society (monarchy); the House of Lords another (aristocracy); and the House of Commons the third (democracy). Of course this theory did not reflect the reality of English politics. The House of Commons was packed with aristocrats—but not nobility—the House of Lords was not that important, and government operated as a series of compromises between Commons and the king worked out after the Glorious Revolution (1688–89). Many colonists believed that their own colonial governments mirrored this mythical balance with the governor representing the monarchy, the council representing the aristocracy, and the lower house representing the demos. But, as in England, this ideal was a pale reflection of reality.

Whatever the reality, the theory held that the balance between these various elements ensured that no one element would become corrupt and take away the liberty of the people. A corrupt monarchy would be despotism, a corrupt aristocracy would be an oligarchy, and a corrupt democracy would be a mobocracy and lead to anarchy. Each of the corrupt forms would threaten the sanctity of property, which was closely connected in 18th-century minds to liberty.

Beyond balancing these various elements, a republic depended on the virtue of each element of society. Virtue in the 18th century could be defined as a willingness to put aside your interests for the public good. The opposite of virtue was corruption. In the 18th century, corruption was pursuing your own interests at the expense of the public interest. The best safeguard of a republic was having virtu-

ous individuals at all levels of society. Since the 18th century was a period of intense study of the classics, republican thinkers cited the example of the Roman general Cincinnatus as the virtuous citizen par excellence. Cincinnatus lived in the early years of Roman history, when Rome was a small city-state. He was working in the field when a neighboring state invaded. Knowing his reputation as a great warrior and leader, the people of Rome came to Cincinnatus and asked him to beat back the invaders. Cincinnatus left the plow and, at the head of the Roman army, defeated the invaders. Upon his return, the people hailed Cincinnatus and wanted to make him a king. But Cincinnatus put aside the riches and personal glory that the crown would provide—his own interest—and returned to his plow in his field. This image was extremely important to revolutionary Americans and GEORGE WASHINGTON strove to live up to it.

Republicanism also entailed a cyclical view of history. All nations were seen as organic, that is, they were perceived as having a life cycle. In youth they were strong and vigorous; at maturity they were powerful and wise; in old age they were decrepit and ready to die. This vision of history was sustained by example from antiquity. Israel, Greece, and Rome all were seen as following this basic cycle. The key in each instance was that when a state had become too large and too powerful, it was liable to corruption and the loss of virtue. Edward Gibbon demonstrated this progression in his *Decline and Fall of the Roman Empire* (1776).

The problem for American revolutionaries became determining where they as a society fit into this cycle. Great Britain could be labeled as on the downswing, having conquered a huge empire it had passed maturity and was entering its last stages before it collapsed. Colonial America, on the other hand, was a new country, with rigor and youth still before it. One of the arguments for independence held that the colonies should separate from Great Britain before its corrupting influence destroyed the virtue of the American people.

With republican ideas as a starting point, revolutionary Americans sought to establish new state governments and eventually created the national government of the UNITED STATES CONSTITUTION in 1787. In the process, many Americans came to believe that a republic could only exist without a king. This idea was best articulated by THOMAS PAINE in *COMMON SENSE* (1776). Paine and others believed that by its very nature, kingship was a corrupting influence and threatened virtue throughout society. Paine also attacked the idea of an aristocracy. Many revolutionaries ended up agreeing with him on this point as well. They argued that aristocrats depended on their title from the king and by their intrinsic nature were sycophants who pursued their own interests at the expense of the public good. Having rejected dependence upon the king and the aristocracy, the revolutionaries had to find a new rationale

for their understanding of the balance among the different branches of government. The idea that the revolutionaries ultimately hit upon, and which was used to defend the creation of the government under the United States Constitution, was that all elements of the government represented the people. The president was thus not akin to the king, who had represented the one; instead, regardless of the fact that he was chosen by the electoral college, he represented the people. Similarly, the Senate did not represent the aristocracy even though they too were not popularly elected under the original procedures of the Constitution; as a body, the Senate represented the people. Finally, members of the House of Representatives were elected by the people (at least adult white male property holders) and represented the people (and three-fifths of each slave). With this logic underpinning the new form of government, a new understanding of the word *republic* began to emerge, equating it with a representative form of government.

Together with these changes there also occurred another important shift. Virtue was no longer seen as simply sacrificing your own personal good for the public good. As Americans adjusted to the new republicanism and a new democratic egalitarian competitive society, virtue came to be seen as working hard for your own good. But since everyone was theoretically on the same playing field and competed as equals, out of this competition, as if guided by some unseen hand, the greater good of all in society would somehow be met. This shift was never complete, and Americans still debate how much restraint should be placed on open competition in the market place and in politics.

### resistance movement (1764–1775)

Although some colonists objected to the SUGAR ACT (1764) it was during the STAMP ACT (1765) controversy that a pattern of resistance emerged that was repeated, with some variations, in reaction to the TOWNSHEND DUTIES (1767) and the TEA ACT (1773). This resistance usually consisted of three parts. First, members of the colonial elite wrote pamphlets and newspaper articles articulating an ideological position opposed to imperial regulation, grounding their arguments on their understanding of the English constitution and the ideal of English liberty. Second, there was some effort at local and colonial organization through committees or congresses. Thus in reaction to the Stamp Act, colonists formed the SONS OF LIBERTY to guide opposition

and there was a STAMP ACT CONGRESS (1765) to offer a petition and statement of grievances to the king. Although there were no large intercolonial meetings in response to the Townshend Duties, Sons of Liberty and other committees organized on a local level and corresponded with each other. Local committees took the lead in the opposition to the Tea Act, but after the COERCIVE ACTS (1774), the FIRST CONTINENTAL CONGRESS met to coordinate activities. In all three cases opposition leaders called for a non-importation movement to put economic pressure on Great Britain. Third, there were RIOTS in the street demonstrating against the imperial regulations and expressing some lower-class resentment against wealth. The committees, often recruited from the middle of society, sought to guide and limit the extent of this popular disorder. But without the mob in the street, it would have been impossible to sustain the resistance movement and enforce the resolutions passed by the committees and congresses.

Although from the perspective of July 4, 1776, it appears as if the resistance movement led inevitably to independence, it is important to remember that the process was long (over a decade) and never intended to break the colonies away from Great Britain. Resistance began in the name of English rights and was based on traditions inherited from Great Britain: The arguments in the pamphlets and newspaper articles were all based on a reading of English political thinkers, and the traditions of popular disorder—belief that the people had a right to riot to express their grievances in the street—came from Great Britain. Similarly, the imperial crisis did not escalate with each new measure. Resistance was extremely intense in 1765 and 1766, but was defused by the repeal of the Stamp Act. Colonists had a difficult time speaking with a unified voice in reaction to the Townshend Duties, and opposition never gained the strength it had in 1765–66. The Tea Act itself also did not bring about a strong opposition everywhere. But once Parliament passed the Coercive Acts, many (but not all) colonial Americans felt compelled to resist.

Resistance, however, was not revolution. Few people even in 1774 saw the war on the horizon. Nor did they see the coming of independence and the renouncing of King GEORGE III. It would take the course of events at the BATTLES OF LEXINGTON AND CONCORD (April 19, 1775) and another year of conflict before many Americans were ready for the DECLARATION OF INDEPENDENCE (July 4, 1776). During that year, colonial Americans became a divided people. Some remained loyal to their king. Others were shocked that his majesty would wage war on them. On August 23, 1775, King George declared his colonies to be in a state of rebellion and authorized the use of force, and even mercenaries, to put down the rebellion. In January 1776, THOMAS PAINE published his *COMMON SENSE* advo-

cating not just independence, but also a whole new social system without a monarchy. In July, the SECOND CONTINENTAL CONGRESS declared that the king had sought to destroy American liberty and thereby abrogated the social contract. Only then did independence become an option pursued by many Americans.

Nash, *The Unknown American Revolution: The Unruly Birth of Democracy and the Struggle to Create America* (New York: Viking, 2006).

**Revere, Paul** (1734–1818) *revolutionary, businessman*

Paul Revere was a skilled silversmith and astute businessman who has become a national icon thanks to Henry Wadsworth Longfellow's patriotic poem "Paul Revere's Ride" (written in 1860). Revere was the son of a French Huguenot immigrant and Boston silversmith. Paul Revere continued the family business when his father died and he gained a reputation throughout the colonies as a master in his craft. Today, his creations are considered among the most outstanding achievements in American decorative arts.

Revere served as a second lieutenant in a failed campaign against the French fortifications on Lake Champlain at the beginning of the French and Indian War (1754–63). Returning to Boston in late 1756, Revere supplemented his family's income by engraving copper plates and by dentistry. Revere was also very active in the St. Andrew's Lodge of Freemasons (see also FREEMASONRY), along with JAMES OTIS and Dr. JOSEPH WARREN. Besides discussing business issues, members of the Lodge also discussed Enlightenment ideas that would later influence their reactions to events in Boston.

Revere joined the opposition to the STAMP ACT (1765), becoming a member of the SONS OF LIBERTY and the North End Caucus. Revere also began engraving political cartoons for the *Boston Gazette*. After the BOSTON MASSACRE (March 5, 1770), Revere captured the scene in his engraving "The BLOODY MASSACRE perpetrated in King Street," which fueled colonial resentment. While no one knows if Revere participated directly in the BOSTON TEA PARTY (December 16, 1773), the Boston COMMITTEE OF CORRESPONDENCE sent him to New York bearing news of the incident. In 1774 Revere became the direct link between the Boston Committee of Correspondence

Paul Revere's ride. Painting (National Archives)

and the FIRST CONTINENTAL CONGRESS in Philadelphia, transmitting information about the resistance in Massachusetts to the COERCIVE ACTS (1774). Revere not only served as a courier, but also gathered intelligence concerning the movement of British soldiers, including the preparations of General THOMAS GAGE in Boston in mid-April 1775. Revere's famous ride took place on the night of April 18 and the morning of April 19, 1775. British officers intercepted Revere and another rider, William Dawes, after Revere had reached Lexington. However, the British officers released Revere, and he returned to Lexington to retrieve JOHN HANCOCK's trunk full of papers and was there when the Battle of Lexington began on April 19, 1775 (see also BATTLES OF LEXINGTON AND CONCORD).

During the war, Revere served as lieutenant colonel in the Massachusetts militia, commanding the troops defending Castle Island in Boston Harbor. Revere also opened a powder mill where he cast musket balls and cannon for the CONTINENTAL ARMY. Also Congress commissioned him to design and print the first Continental currency and the first official seal. Revere's chances of advancement in the military ended with accusations of insubordination in the failed PENOBSCOT CAMPAIGN (July 25–August 14, 1779), although a court-martial acquitted Revere of all charges.

Revere returned to Boston and his business interests, which by the end of the war included importation of European goods and a small hardware store. Revere became a successful businessman, and in 1801 opened the first copper rolling mill in the United States. This enterprise expanded rapidly, and Revere provided the copper sheet-

ing for the hull of the USS *CONSTITUTION* and the dome of the Massachusetts State House. Revere turned all his business interests over to his sons and grandsons in 1810 and died in Boston on May 10, 1818.

### Revolutionary War (1775–1783)

The Revolutionary War was the military conflict that gained independence for the United States. It began with the BATTLES OF LEXINGTON AND CONCORD on April 19, 1775, and lasted until the British evacuated New York City on November 25, 1783. The conflict engulfed all of the British mainland colonies and included battles of regular armies numbering into the thousands as well as partisan local warfare of bands of men less than 100. While Americans today often view the war in cut and dry terms of patriots versus the British, the actual conflict was a civil war that pitted one group of Anglo-Americans against another group of Anglo-Americans. For the people who lived through this long contest, the period was marked by difficulties and ambiguities.

Military historian John Shy suggests that the British strategy can be divided into three phases. At first the British believed that they were involved in a police action where their army was to put down a civil disturbance. When the British left Boston for Lexington and Concord on the night of April 18, 1775, they believed that the colonial rabble could not stand up to trained professional troops. They hoped a strong show of force would throw the colonists into confusion and convince them to obey the law. While this belief was sustained on Lexington Green—the local militia quickly ran before the military might of the British—it did not hold as true at Concord Bridge or during the long retreat back to Boston. A similar belief in the weakness of colonial militia when confronted by professional soldiers lay behind the frontal assault at the BATTLE OF BUNKER HILL (June 17, 1775). Thereafter, the British decided to retrench and engage in a more conventional form of war. They thus withdrew from Boston and sought a strategic base for operations.

In the conventional warfare of the 18th century, according to historian Shy's claims about the second phase of the war, the ideal was to outmaneuver the enemy and minimize casualties. In the 18th century it took time and money to train armies to march under fire, stand a few hundred yards from the enemy and exchange volleys of musketry. When the British invaded New York in the summer

of 1776, they succeeded brilliantly in outmaneuvering General GEORGE WASHINGTON and the CONTINENTAL ARMY. In a series of engagements, Washington was forced to retreat, first from after the BATTLE OF LONG ISLAND (August 27–30), then after the British captured Manhattan, then after the BATTLE OF WHITE PLAINS (October 28, 1778), across the Hudson, and out of New Jersey. The counterpunch that Washington launched at the BATTLES OF TRENTON AND PRINCETON (December 26, 1776, and January 3, 1777) hurt the British and compelled them to withdraw from most of New Jersey but did not change their strategy. The campaign of 1777 was also to be a war of maneuvers. The army under General WILLIAM HOWE may have taken the long route to Philadelphia via the Chesapeake Bay but beat Washington at the BATTLE OF BRANDYWINE (September 11, 1777) and captured Philadelphia. Unfortunately for the British, their larger strategic aims were not clearly defined. General JOHN BURGOTNE advanced south from CANADA throughout the summer of 1777, hoping to link up with Howe coming from New York City. Efforts by General HENRY CLINTON to do so with a smaller force were too little too late. Burgoyne had to surrender his army at SARATOGA (October 17, 1777), changing the complexion of the war.

With the defeat in Saratoga, and with France entering the war on the side of the United States, Great Britain had to rethink its position. This reassessment began a third phase of British strategy during the war, one that Shy calls pacification. The idea was for the British army to occupy an area of the southern colonies, solidify support with LOYALISTS, secure the southern colonies, and eventually work its way up to Virginia and the northern colonies. Simultaneously, the army would hold onto strategic bases like New York and Newport. The British evacuated Philadelphia and centered an army on New York. At the end of 1778, the British captured Savannah (see also BATTLE OF SAVANNAH). On May 12, 1780, they captured a large Continental force at Charleston and began to move into the backcountry, but they overextended themselves (see also SIEGE OF CHARLESTON). Although many Loyalists flocked to their cause, they had trouble controlling territory. Moreover, the British suffered serious setbacks at the BATTLE OF KING'S MOUNTAIN (October 6, 1780), where a large Loyalist force was wiped out, and at the BATTLE OF COWPENS (January 17, 1781), where Colonel BANASTRE TARLETON was lucky to escape with his life and a handful of soldiers. The commander of the southern army, CHARLES, LORD CORNWALLIS, abandoned his supply lines and the strategy of pacification and, seeking to punish the revolutionaries for these defeats, pursued General NATHANIEL GREENE's troops through North Carolina. A pyrrhic victory at the BATTLE OF GUILFORD COURTHOUSE (March 15, 1781) left Cornwallis in no better position than he had been when

he entered North Carolina. Eventually, he made his way into Virginia, hoping to join British forces there and to connect with Clinton in New York. Unfortunately for the British, he found himself isolated at YORKTOWN and compelled to surrender to a Franco-American army on October 19, 1781. The war continued for two more years, but few major battles were fought.

Although much of the revolutionary-American strategy was reactive, it had four major components. First, there was an effort to drive the British off of the North American continent. Thus the troops that surrounded Boston in the spring and summer of 1775 hoped to see the British abandon the city and the colonies. In this they were partially successful. The British left Boston but went to Halifax, Nova Scotia, from which they launched a massive invasion of New York. Likewise, revolutionaries attacked Canada, capturing Montreal on November 13, 1775. The invasion, however, faltered after the failed assault in the BATTLE OF QUEBEC (December 31, 1775) during a snowstorm. In early spring, the remnants of the revolutionary forces retreated back to New York.

After the effort to expel the British from the continent failed, the United States settled down to create a Continental army. The image of the embattled farmer defending his country against the British does not quite fit the reality of the Continental army. What General George Washington wanted was a professional army just like the army that the British had. Washington's genius was less on the battlefield—he lost most of the battles he fought—than in building and maintaining an army. Enlistments lengthened as the war continued, and mainly the poor filled its ranks. But the Continental army gave the new nation a focus, and it provided a reason for the existence of a national government. As long as there was a Continental army, there was a United States. By the time the British surrendered at Yorktown, the army had a professional officer corps and well-trained men in the ranks.

The third major component to American strategy was to find allies. Colonial Americans had fought repeated wars against the French. They now sought support from their former enemies. Almost as soon as the rebellion began, France sent some aid to the colonists hoping to weaken its long-time nemesis, Great Britain. The French, however, delayed entry into the war until 1778, after the victory of Saratoga and after they had finished preparing their fleet for action. This alliance was crucial to the success of the Revolution. Without a French fleet off the Virginia capes, Cornwallis would have escaped the trap of Yorktown. Moreover, half the troops surrounding Cornwallis at Yorktown were French. The French supplied money, weapons, and uniforms throughout the war. Privateers (see also PRIVATEERING) and warships from the United States used French ports as bases. And the French

extended the conflict to the WEST INDIES and beyond. The French also helped to bring in other nations into the war—not in formal alliance with the United States—such as Spain and the Netherlands.

The fourth component of the revolutionary strategy involved the militia. These volunteer units were notoriously unreliable in battle. When confronted by the bright red uniforms of the British, and the steel of their bayonets, the militia usually ran, exposing the flank of the Continental regulars. But the militia helped to win the war. At crucial times during the conflict, the militia filled the ranks of the army. Many of the men at Saratoga were militia. Similarly, in the guerilla warfare that spread in the wake of the British invasion of the South, the militia played an important role. But perhaps the most significant contribution of the militia was local. Organized by committees of safety, in community after community, the militia were the means by which individuals were compelled to join the cause of independence. There was no better litmus test to measure the loyalty of an individual than to see if he showed up at the militia muster. If he did not come to the monthly drill, local leaders labeled him a Tory and declared him in opposition to Congress. Fines were then levied, and sometimes nonmilitia members were imprisoned and their property confiscated. This type of coercion helped to solidify support and raise money to fight the conflict. There were also some Loyalist militias. But by definition, the Tories relied on the regular functioning government. During the revolution, that government broke down. In its place came the WHIG committees and (patriot) militia.

The Revolutionary War was often a messy conflict. Armies marched across whole colonies, and, regardless of allegiances, property might be seized by hungry soldiers. There were also zones between the camps of the opposing armies where no law seemed to be in force. Similarly, the war saw neighbors fighting against each other and families divided. Local battles might be fought between contending groups of militias. Even if there were no invading armies or battles fought nearby, there was a constant drain of supplies and manpower. Continental currency was highly inflationary, and TRADE was often disrupted. While some men joined the war for ideological reasons—either supporting independence or opposing it—others were mainly concerned with the recruitment bounty. Men switched sides during the conflict. They also deserted, leaving the army to return to their farms or civilian occupations. They would also desert to sign aboard a privateer—either for the United States or Great Britain—hoping to make money in legalized piracy. While some men struck it rich, most were less fortunate. More than 10,000 sailors were captured at sea and imprisoned by the British. In this long drawn-out conflict, high-sounding ideas sometimes evaporated in the face of harsh realities.

The war took its toll among women as well as men. Often left behind when the men went off to war, women had to expand their already extensive household duties to run farms and businesses. Some women joined the army as CAMP FOLLOWERS. It was their job to nurse the wounded, cook the food, and wash the clothes. Both the British and Continental armies included such women in their regimental account books. Whatever their sacrifices during the conflict, the men who created the new governments in the United States continued to exclude women from the political process.

### Rhode Island, Battle of (August 29, 1778)

The Battle of Rhode Island was the culmination of the first major effort of Franco-American cooperation after the FRENCH ALLIANCE (February 6, 1778) had been agreed upon. Despite a promising beginning, a combination of bad luck and misunderstandings almost led to disaster. As it was, the American revolutionary army that was left to attack the British at Newport by itself managed a tactical victory but was ultimately forced to lift the siege and withdraw.

The British had occupied Aquidneck Island (the large island in Narragansett Bay sometimes called Rhode Island) almost unopposed on December 7, 1776. Newport, which was on the island, was used as a base of operations against New England and afforded one of the best harbors on the continent for the British navy. Until they withdrew from Newport on October 25, 1779, the British maintained a garrison of about 5,000 on the island. For most of this period, the occupation was marked by raid and counter-raid between the revolutionary forces on the mainland and the British on the island. But in the summer of 1778, when campaigns on the Delaware and in New York Harbor appeared unviable, a major Franco-American effort to dislodge the British was launched.

The plan was for the CHARLES-HENRI-VICTOR-THÉODAT, COMTE D'ESTAING to land the French troops he brought with him and, with his naval superiority, act in concert with a large contingent of the CONTINENTAL ARMY and New England militia to capture Newport. When the French arrived off Newport on July 29, the revolutionaries were not quite ready. After some discussion, General JOHN SULLIVAN of the Continental army and d'Estaing agreed to a coordinated attack on August 10. But when General John Pigot, the British commander, withdrew from his advanced positions on the northern end of the island, Sullivan decided to move without the French. From a tactical standpoint he had little choice. From a diplomatic point of view, this action injured Gallic pride since the French believed that they were the senior allies and ought to have precedence in any attack. The question became moot, however, when a British fleet arrived from New York on August 9. D'Estaing immediately put out to sea. The two fleets maneuvered for position, but before the battle could be closed a hurricane came up, scattering the ships of both nations. By August 14 the storm had ended. Both fleets were in need of repair. The British returned to New York. D'Estaing, following the advice of his captains, decided to sail to Boston to refit. The French headed for Boston on August 22, leaving Sullivan to face the British alone. To make matters worse, thousands of militia had had enough of the campaign and went home.

Sullivan, enraged by the French withdrawal, had to lift the siege of Newport. He dug in with the remaining 7,000 troops on the northern end of Aquidneck Island. Pigot, sensing an advantage, decided to attack. An intense battle ensued in which Sullivan's men repeatedly smashed the British advances. By the end of the day, the revolutionaries had held their ground, with losses of 30 killed, 137 wounded, and 44 missing to the British losses of 38 killed, 210 wounded, and 44 missing. Both sides were too exhausted to continue the fight. Sullivan, recognizing that he was in danger of being cut off from the mainland by the British navy, successfully removed his troops from the island on the night of August 30. Two days later, 5,000 British reinforcements arrived. Had Pigot waited to attack, this addition may well have crushed Sullivan.

### Riedesel, Frederica Charlotte, baroness von

(1746–1807) *wife of German mercenary officer*

The daughter of a Prussian general, Frederica Charlotte, baroness von Riedesel was married to General Baron Friederich von Riedesel, who commanded the Brunswick contingent of the so-called HESSIAN or German troops used by the British to fight the REVOLUTIONARY WAR (1775–83). After waiting in Germany for the birth of a child she was

Frederica Riedesel (National Archives)

expecting, and then experiencing further delays in transit in England, the baroness traveled to CANADA in 1777 with three young children to be with her husband as he campaigned in North America. The baroness was with her husband during the fighting that led up to General JOHN BURGOYNE's surrender at SARATOGA (October 17, 1777). She also was with him throughout his captivity, first at Cambridge, Massachusetts, and then at Charlottesville, Virginia. When he was paroled and then exchanged, she traveled with General von Riedesel to New York and Canada, leaving North America in August 1783. During her sojourn the baroness gave birth to two children, one named "America" and another who was generally called by one of her middle names—"Canada."

The baroness is most noted for her detailed diary of her experiences in North America. The diary provides a wonderful insight into the experiences of traveling with an 18th-century army and offers graphic detail of the suffering and dying of the wounded in the aftermath of battle. The baroness first published her memoir in Berlin in 1800, and it has since been published many times.

## riots

Riots were an important part of American life in the second half of the 18th and beginning of the 19th centuries. Colonial Americans resisted imperial regulation, expressed deep-felt grievances, and sought to regulate their community through rioting. By the opening decades of the 19th century, riots increasingly represented divisions within the community. Thus, rioting shifted from an almost legitimate activity to an increasingly illegitimate activity from 1761 to 1812.

A riot is a form of collective action taken by 12 or more individuals to effect their will immediately through the use of force, or the threat of the use of force, outside the normal channels of the legal process. A wide variety of types of crowd behavior can be included within this definition of rioting. Parading with an effigy, as was done during many STAMP ACT (1765) disturbances in an effort to threaten and coerce an individual, would be considered a riot. Similarly, the destruction of property, as in the attack on THOMAS HUTCHINSON's house on August 26, 1765, or in the BOSTON TEA PARTY (December 16, 1773), would also be a riot. So, too, would be an attack on an individual or a group of individuals, as occurred in Baltimore in the summer of 1812.

During the 18th century, many colonial and revolutionary Americans believed that they had a legitimate right to riot when official channels of redress of grievances were closed to them or did not respond to their needs. This sense of legitimacy was directly connected to a belief in CORPORATISM—the idea that everyone within society shared a single interest. Ordinarily it was assumed that within the hierarchical structure of society those on top would paternalistically protect those on the bottom of society. When for some reason this protection did not appear, then the people in the street believed that they had a right, almost a duty, to act in concert to defend the common interest. The crowd would seldom violently attack an individual. Instead it focused its attention on property. The classic case of this type of rioting in England, from where these principles were inherited, concerned the regulation of the price of bread. It was a common belief that there was a just price—one that was fair to both the baker and the purchaser—for bread. If prices rose too high, then the people could riot and compel the distribution or sale of the bread for a just price. This type of riot occurred infrequently in colonial America. However, during the REVOLUTIONARY WAR (1775–83), when goods sometimes became scarce and inflation forced the price of staples beyond the reach of the poor, scores of such riots erupted.

Rioting was instrumental to the RESISTANCE MOVEMENT (1764–75). Colonial Americans demonstrated their opposition to the Stamp Act by rioting. Usually these disturbances, raised in the spirit of defending the community against outside intrusion, focused on an object that symbolized the immediate grievance. Thus anti-Stamp Act riots used effigies to intimidate stamp distributors into resigning. When Bostonians wanted to express their opposition to the Tea Act, they destroyed the tea by dumping it into the harbor. Colonial Americans also developed some more painful tactics. Applying a coat of tar and feathers to an individual, begun in Massachusetts seaports in 1767, could inflict some personal harm. But its main intent was to hold the victim up to public ridicule, making him appear more an effigy of the devil than a real person. No one was ever killed by tar and feathers alone.

Other riots broke out in the same period, most of them fitting into the 18th-century pattern of disorder. Opposition to smallpox inoculation in Norfolk (1768 and 1769) and Marblehead (1774) led to disturbances centered on the destruction of property. In Marblehead the crowd broke some windows, burned a boat that transported the inoculated, and pulled down the hospital. Pulling down buildings was a favorite tactic of colonial crowds and occurred frequently in the many LAND RIOTS that took place in what is now Vermont, on Hudson River estates, and in New Jersey and the Carolinas. These land riots, however, could sometimes turn more violent because they often pitted one segment of the community against another. Fatalities occurred in the WYOMING VALLEY WAR of Pennsylvania and the Regulator movements of the Carolinas.

Rioting shaded into outright warfare between supporters and opponents of independence during the Revolutionary War. But the community based riot focused on property persisted in the post war years. New York City residents, for example, demonstrated their anger against grave robbing by destroying a hospital in the Doctor's Riot (April 13–14, 1788) and tore down some bawdy houses in 1793 and 1799. The Shays rebels in 1786–87 limited most of their activity to closing courts and followed patterns of collective action established during the resistance movement. They quickly dispersed once confronted by armed troops representing the state. The Whiskey rebels in 1794 generally confined themselves to tarring and feathering excise men, although they did engage in one gun battle. They, too, disbanded in the face of government opposition.

While similar disturbances continued to appear after 1800, rioting also began to change. In the democratic world created by the AMERICAN REVOLUTION, many argued that it was no longer necessary for people to riot since they had a truly representative government and official channels for a redress of grievances. Moreover, with the rise of equality, people were cut off from a sense of dependence upon one

another and began to associate more on political, racial, class, and ethnic lines. Along these fissures in society the potential for personal physical violence grew. In the summer of 1812, as the United States entered a war with Great Britain, a wave of rioting swept over Baltimore that demonstrated this transition. In a riot reminiscent of the 18th century, Baltimore DEMOCRATIC-REPUBLICANS dismantled a FEDERALIST PARTY newspaper office on June 22. The action represented a standard attack on property like the pulling down of a house. Other riots followed that featured ethnic and racial attacks. Finally, on July 27–28, when some members of the Federalist Party strove to reestablish the newspaper in the city, a bloody conflict ensued that saw the murder of two men and the brutal beating of several more. After 1812 riots increasingly included personal physical violence and fatalities.

**Rittenhouse, David** (1732–1796) *scientist, inventor, publisher*

Other than BENJAMIN FRANKLIN, David Rittenhouse was the most prominent North American scientist in the 18th century. Rittenhouse had little formal EDUCATION, growing up on a farm in rural Pennsylvania. But he had a natural penchant for mechanics and mathematics, and at an early age he began studying on his own and developing skills as an instrument maker. By the time he was 19, he had constructed a shop on his father's farm and made clocks and mathematical instruments. Starting in the 1750s, Rittenhouse's astronomical and surveying instruments became known as the best available in North America. Rittenhouse constantly strove to improve the mechanics of these instruments and thus became an inventor as well as a highly skilled ARTISAN. Rittenhouse also put his technical knowledge to use. He was frequently employed as a surveyor. He was hired to fix the southwest boundary of Pennsylvania, and in the 1770s and 1780s he surveyed the boundaries of several states, including New York, New Jersey, and Massachusetts. Rittenhouse also built his own observatory and helped to coordinate the North American observations of the transit of Venus in 1769. He built two orreries—working models of the solar system—one for the College of New Jersey (Princeton) and the other for the College of Philadelphia (University of Pennsylvania).

He was granted several honorary degrees and published papers on mathematics and astronomy. He also taught at the University of Pennsylvania and served on its Board of Trustees. Active in the AMERICAN PHILOSOPHICAL SOCIETY (APS) when Franklin died, Rittenhouse was named the second president of the APS in 1791. His fame as an astronomer and mathematician spread across the Atlantic, and he was appointed as a foreign member of the Royal Society in London in 1795.

Rittenhouse supported the AMERICAN REVOLUTION. He had moved to Philadelphia in 1770, where he served as an engineer for Philadelphia's Committee of Safety in 1775 and was later selected the committee's vice president and president. He was also elected to the general assembly and participated in the writing of Pennsylvania's state constitution in 1776 (see also CONSTITUTIONS, STATE). He was state treasurer from 1779 to 1787. During the REVOLUTIONARY WAR (1775–83) he helped to organize munitions in Philadelphia, even to the point of supervising the exchange of iron for lead in the city's clocks, since the lead was needed for bullets. In 1792 GEORGE WASHINGTON appointed him director of the United States Mint.

**Rochambeau, Jean-Baptiste-Donatien de Vimeur, comte de** (1725–1817) *soldier*

Comte de Rochambeau was the commander of the French army in North America during the REVOLUTIONARY WAR (1775–83). Born into the French nobility at Vendôme, France, he had already established a successful military career when the fighting in North America broke out, reaching the rank of brigadier general and inspector of the cavalry in 1761. In 1780 he was assigned the command of French land forces in the United States. Rochambeau and his troops arrived in Newport, Rhode Island, in July 1780, where the British navy bottled them up for nearly a year while Rochambeau waited in vain for French naval support. In June 1781, without naval support, he combined his troops with those of General GEORGE WASHINGTON at White Plains, New York, and slipped past the British and headed south to YORKTOWN. At Yorktown, the French and Continental armies, with support from the French navy under admiral the COMTE DE GRASSE, trapped CHARLES, LORD CORNWALLIS and a British army on a peninsula. Cornwallis surrendered on October 19, 1781, effectively ending the war.

Rochambeau stayed in the United States for more than another year, sailing home in January 1783. King Louis XVI rewarded him handsomely for his efforts in North America by appointing him to the position of commander of Calais.

Back in France, Rochambeau supported the FRENCH REVOLUTION (1789–99) from the outset. He was a successful commander of revolutionary forces—he commanded the northern army and was made a field marshal in 1791. In time though, he became alarmed at the direction of the Revolution and retired from his post in July 1792. He was arrested by the government of Maximilian Robespierre during the Reign of Terror, and only Robespierre's fall from power saved him from the guillotine. He was released from prison in 1794 and had his rank and lands restored by NAPOLEON BONAPARTE.

—J. Brett Adams

**Rodney, Caesar** (1728–1784) *lawyer, politician*

Inheriting a substantial estate in Delaware freed Caesar Rodney to devote his life to public service. Although he had little formal EDUCATION, Rodney held a variety of local offices such as sheriff and clerk to different courts. In 1769 he was even appointed to the Delaware Supreme Court. Rodney also served in Delaware's colonial assembly in 1758 and then in every year but one from 1761 until independence. He was chosen speaker of the Delaware Assembly in 1769 and from 1773 to 1776. More importantly, Rodney became a leader in the RESISTANCE MOVEMENT (1764–75) to British imperial regulation in Delaware, attending the STAMP ACT CONGRESS (1765). As speaker of the Delaware Assembly in 1774, Rodney called a special session of the legislature—an illegal act—that met as a convention and chose delegates to the FIRST CONTINENTAL CONGRESS. Rodney was one of those delegates and was selected again to attend the SECOND CONTINENTAL CONGRESS. Upon meeting Rodney, JOHN ADAMS wrote that he was “the oddest looking Man in the World; he is tall, thin and slender as a Reed, pale; his Face is not bigger than a large Apple, Yet there is Sense and Fire, Spirit, Wit, and Humour in his Countenance.”

Rodney is most famous for traveling 80 miles to vote for independence in Congress. The Delaware delegation was divided with George Read ready to vote against independence and Thomas McKean ready to vote for it. McKean sent word to Rodney, who was in Delaware quelling LOYALIST opposition to the revolutionary government. Rodney dropped everything on July 1 and rode through the night to cast the deciding vote for Delaware's delegation to support independence. All three Delaware representatives, however, signed the final document.

Most of Rodney's efforts in the REVOLUTIONARY WAR (1775–83) centered on his home state. Although conser-

vative opposition prevented his election to Delaware's state constitutional convention (see also CONSTITUTIONS, STATE), and prevented his reelection to the Continental Congress in 1776, Rodney remained active in local committees and as an officer in the state militia. Rodney was not politically unpopular for long; he became a major general in command of the militia in September 1777, was returned to the Continental Congress in December 1777, and was elected president (chef executive) of Delaware in March 1778. He served as president for three crucial years, organizing the state's defenses, mobilizing support for the Revolution, dealing with neutrals and Loyalists, and providing supplies for the army. He stepped down from office in November 1781. By this time, he was struggling with a cancer on his face that had grown worse with time and eventually killed him in 1784. Rodney died having left no children, and his heir was his nephew, CAESAR AUGUSTUS RODNEY.

**Rodney, Caesar Augustus** (1772–1824) *lawyer, politician, senator*

The nephew and principal heir of CAESAR RODNEY, Caesar Augustus Rodney was born in Delaware but spent part of his youth in Pennsylvania. He attended the University of Pennsylvania, studied law, and was admitted to the bar in both states in 1793. Rodney settled in Delaware and became a leader of the state DEMOCRATIC-REPUBLICAN PARTY. From 1796 to 1802 Rodney sat in the Delaware legislature. President THOMAS JEFFERSON urged Rodney to run for Congress in 1802 against James A. Bayard. Rodney won the seat and became an important supporter of the administration in the House of Representatives, helping to manage the IMPEACHMENT of John Pickering and SAMUEL CHASE.

Rodney left Congress after 1804, preferring to pursue his lucrative legal practice. Although Rodney represented some affluent clients, he was also the lead attorney in the defense of the Philadelphia cordwainers in the 1806 conspiracy labor trials in which he declared that convicting the shoemakers would be refuting the achievement of the AMERICAN REVOLUTION. He also appealed to a sense of social justice and the egalitarian ideals of the Revolution in the case. Rodney called the master shoemakers greedy because they were unsatisfied “with the rapid rate at which they were at present amassing wealth” and wished “to make their fortunes by a single turn of the wheel.” In 1807 Rodney became Jefferson's attorney general, a position he continued to hold under JAMES MADISON until 1812, when he resigned.

Elected to the state senate in 1815, Rodney was appointed in 1817 to a commission to study the political status of the new Latin American republics. Rodney returned

from Buenos Aires in 1818, and he was elected to Congress in 1820. In 1822 the Delaware legislature selected Rodney as a U.S. senator. Rodney's career in the Senate was short-lived when he accepted the appointment as the first U.S. minister to Argentina in 1823. Unfortunately, Rodney died soon after his arrival in Buenos Aires.

**Ross, Betsy** (1752–1836) *artisan*

A seamstress in Philadelphia during the REVOLUTIONARY WAR (1775–83), Elizabeth “Betsy” Ross is the reputed creator of the first national flag of the United States. Born into a QUAKER family as Elizabeth Griscom, Ross was the eighth child of 16. Apprenticed to a leading upholstery firm, Betsy was 21 when she married John Ross, an Episcopalian (see also ANGLICAN CHURCH). Because she had married outside her faith, the Society of Friends disowned Ross. The Rosses set up their own upholstery shop on Arch Street, but John died in a munitions explosion in 1776. Undaunted, Ross kept the business going, applying her skill with a needle and thread to diverse projects. Records indicate she made flags for various naval vessels, and according to family tradition, she embroidered ruffles on shirts belonging to General GEORGE WASHINGTON.

It was not until 1870 that word of her most famous commission came to light. At a meeting of the Historical Society of Pennsylvania, William Canby, one of Ross's grandsons, told of a meeting at her shop in June 1776 in which Washington and two members of the SECOND CONTINENTAL CONGRESS, ROBERT MORRIS and Colonel George Ross, her late husband's uncle, asked the seamstress to make the first flag for the United States. Ross recommended alterations to Washington's proposed design, and the finished banner incorporated her suggestion of five-pointed stars rather than those with six in the general's sketch. The public embraced Canby's story, its purported authenticity bolstered by the facts of Ross's occasional employment as a flag maker and her acquaintance with Washington. Though no conclusive evidence has yet proven the validity of Ross's claim to fame, the Arch Street shop nevertheless stands as a shrine to the birthplace of the U.S. flag. Still maintaining her upholstery business, Ross married John Ashburn in 1777 and had two children. Ashburn was captured by the British, however, and died in Old Mill Prison in 1782. A year later, Betsy took her third husband, John Claypoole, who had shared a prison cell with Ashburn. The Claypooles had five daughters. Betsy was widowed again in 1817. She lived in Philadelphia until her death and is buried in Mt. Moriah Cemetery.

—Rita M. Broyles

**Rowson, Susanna Haswell** (1762–1824) *novelist, poet, playwright*

Most noted as the author of the best-selling *Charlotte, a Tale of Truth* (1791), Susanna Rowson wrote novels, poetry, and plays, as well as performed on stage. In later life she operated a school for young females.

Although born in England, she spent much of her youth in Massachusetts. When the REVOLUTIONARY WAR (1775–83) broke out, she had to return to England because her father was a British officer. She remained in Great Britain until 1793, when she moved to the United States. By that time she was married and had become an author and actress. Her sentimental novel about Charlotte Temple, a woman seduced and abandoned by a British officer, was hugely successful in the United States. It sold more copies than any other book for decades to come. Rowson's book was a morality tale that appealed to popular sensibilities, demonstrating how a British officer could deceive even a virtuous young woman. Rowson and her husband had turned to the stage in 1792 to earn a living, and they were recruited to go the United States and perform. Once in the United States, Rowson not only appeared in Philadelphia, Baltimore, Boston, and Annapolis, but she also wrote plays. She capitalized on interest with the BARBARY WARS in 1795 by writing *Slaves in Algiers*, and she composed poetry verses with patriotic themes, which were recited in THEATERS. In 1797 she decided to leave the stage to set up a school for young ladies in the Boston area. She remained an educator for the rest of her life. She kept her pen active by writing textbooks as well as poetry, songs, essays, and additional novels.

**rural life**

Most Americans before 1812 lived in rural settings and worked on farms. While historical events sometimes intruded on this world and there were geographical differences, we can make some generalizations about the agrarian experience.

Life in the countryside was dictated by the seasons. This observation is logical when applied to the arena of work: For most of North America sowing and harvesting follow a set rhythm come spring, summer, and autumn. But it also holds for other aspects of the agrarian world. Marriages usually occurred in March and April, as farmers prepared for the new growing year, or in November and December after harvest and before the darkest winter. Similarly, babies were born most frequently in late win-

ter and early spring, indicating that conception often took place in late spring and early summer. Death and disease could strike at any time, but most deaths occurred in the winter when not only was the weather colder but also nutrition poorer with less work (thus less income) and fresh food (see also DISEASE AND EPIDEMICS).

People in the countryside lived in family units. Men married in their mid-20s, women a few years younger. Within a year of the wedding, a couple would likely have their first child, and then average another pregnancy every two years. Few families did not experience serious illness and the death of some children. However large their family grew, housing was limited. Only the very wealthy could afford homes with several rooms. Instead, the landscape was littered with “indifferent,” “poor and old,” and “small and mean” dwellings of one or two rooms. Privacy hardly existed, as space served multiple purposes. In small houses there were no separate bedrooms, living rooms, or kitchens. Often all members of a family shared sleeping quarters. Chamber pots and nearby privies served their “necessary” function. Both the exteriors and the interiors were messy. One English traveler in 1818 wrote that there was “a sort of out-of-doors slovenliness. . . . You see bits of wood, timber, boards, chips, lying about, here and there, and pigs tramping about in a sort of confusion.” Inside there was not much furniture—beds, a table, and a few chairs—and little in the way of decoration. At night the open fireplace and a candle or two might serve for illumination. In the summertime there was no escape from the heat, and in winter limited comfort from the cold in the fireplace or stove. Dirt was everywhere.

While these generalizations about rural life hold throughout the period and for most European Americans, there were some important variations. Many farm families suffered during war. Those who lived closest to the FRONTIER could experience depredations from NATIVE AMERICANS, but it is also important to remember that Indian warfare was not a constant and that European Americans and Native Americans frequently learned to deal with one another on a daily basis. The REVOLUTIONARY WAR (1775–83) had extensive and prolonged impact on people in the countryside. Both British and revolutionary military demands for manpower drained labor, leaving women to run the farm and labor in the fields (ordinarily white women worked mainly in the barnyard and household). Since the war sooner or later reached almost every community directly, with raiding militia units or marching armies, farms might suffer destruction, looting, or attacks on individuals, including rape. The QUASI-WAR (1798–1800) had little effect on rural life, and the War of 1812 (1812–15) was not as much of a drain on manpower as the Revolutionary War and had a more limited geographical impact.

Regionally, the biggest difference was between the North and the South. The northern states had never relied heavily on SLAVERY for labor, although some slaves had worked on farms. The emancipation of slaves therefore made little difference on the agrarian scene, except that many rural AFRICAN AMERICANS left the countryside for the city once they were freed. The southern states remained committed to slavery, though only a large minority of southerners owned slaves. Many people in the South farmed and lived in the same manner as those in the North. But the presence of slavery in the region provided a whole other standard of living that was lower than the white farmstead—the slave quarter. It also offered examples of affluence to aspire to—the plantation house.

The family farm was never entirely self-sufficient and had always participated in the market to some extent. During the revolutionary and early national periods profit became even more important. With this development there was also a growing consumerism, first in the Northeast and then spreading south and west. With increased income from surplus production, people began to replace wooden bowls with porcelain plates, purchase more furniture, and decorate their homes. By 1812 rural Americans had started to notice the dirt and buy brooms.

**Rush, Benjamin** (1746–1813) *scientist, physician, social reformer, signer of the Declaration of Independence*

Benjamin Rush exemplified the ideals of the Enlightenment and earned his well-deserved place in history due to his contributions to both SCIENCE and the founding of the United States of America.

Rush was born in Byberry, Pennsylvania, on January 4, 1746, to John and Susanna Rush, and he died in Philadelphia on April 19, 1813. Rush's early EDUCATION and devout religious views grew together, first in a private school and then at Princeton, where he graduated in 1760. Following a six-year medical apprenticeship and formal education in MEDICINE and chemistry, Rush enrolled in the medical program at the University of Edinburgh. After completing his education at Edinburgh in 1768, Rush investigated the use of chemical reactions in factories in England. Upon his return to North America in 1769, Rush was appointed professor of chemistry at the College of Philadelphia. In 1770, he published *Syllabus of a Course of Lectures on*

Benjamin Rush (Library of Congress)

*Chemistry*, a slim volume of lectures on chemistry presented in a medical context.

Throughout Rush's career he taught more than 3,000 students in chemistry and medicine, instilling in them a methodology of clinical interpretation of disease. (See also *DISEASE AND EPIDEMICS*.) Rush's belief that all disease stemmed from one cause, which could be cured by debilitating methods such as bloodletting and purging, while not unusual in his time, has led to excessive condemnation by historians. During the yellow fever outbreak in Philadelphia in 1793, Rush's cures were feared by some more than the disease itself.

Rush served as surgeon and physician general of the Middle Department of the CONTINENTAL ARMY during the REVOLUTIONARY WAR (1775–83) but resigned in 1778, believing that his superior, William Shippen, mismanaged military hospitals. Shippen, however, was supported by General GEORGE WASHINGTON, and this eventually led to Rush's questioning Washington's judgment on many things, including military matters. Rush later regretted his criticism of Washington.

In addition to his work in chemistry and medicine, Rush was considered the father of psychiatry in the United States. His belief in the connection between the body and the mind led to an unorthodox approach to treating the insane. His lectures and discussions on the operation of the mind, along with his practical experience, culminated in 1812 in his book *Medical Inquiries and Observations Upon the Diseases of the Mind*.

Aside from his medical influence, Rush's political influence in a turbulent era is equally impressive. In 1776 Rush was a member of the SECOND CONTINENTAL CONGRESS and a signer of the DECLARATION OF INDEPENDENCE (July 4, 1776). He supported greater education for women, helped found Dickinson College, and served as a trustee for that institution. Rush also differed from many politicians of his day in his outspoken opposition to SLAVERY and capital punishment. He also called for both penal and educational reform, the latter in the form of a network of colleges, eventually leading to a national university. President JOHN ADAMS appointed him to the duties of the treasurer of the United States Mint, a post he held until his death.

**Sacagawea** (1790?–1812?) *interpreter for the Lewis and Clark Expedition*

Popular mythology holds that Sacagawea, a young Shoshone woman married to Toussaint Charbonneau, not only saved the LEWIS AND CLARK EXPEDITION (1803–06) by obtaining horses from her Shoshone relatives but also acted as a chief guide. However, while Sacagawea accompanied the “Corps of Discovery” under MERIWETHER LEWIS and WILLIAM CLARK from the bend of the Missouri River to the Pacific Ocean and back, her role was more limited than legend would have it.

Historians have few hard facts about Sacagawea. We do know that she was a Shoshone born around 1790 somewhere near the source of the Missouri River. At a young age, Hidatsa warriors captured and enslaved her, teaching her their language. Toussaint Charbonneau, a trader of French descent, probably bought Sacagawea as a wife, and in February 1805 she gave birth to Jean Baptiste Charbonneau in a Mandan village. Lewis and Clark wintered in the same village in 1804–05 and thought that the Charbonneaus might help them as translators because Toussaint Charbonneau spoke Hidatsa and French, and Sacagawea was fluent in Shoshone and Hidatsa. In April 1805 the couple and their newborn baby joined the Corps of Discovery as it traveled up the Missouri River to the Rocky Mountains. After Lewis and Clark met the Shoshone in the foothills of the Rockies, Sacagawea, whose brother was in the band of Shoshone, interpreted the Shoshone speeches into Hidatsa, her husband translated the Hidatsa into French, and a French-speaking member of the expedition delivered them in English to Lewis or Clark. Out of these negotiations Lewis and Clark obtained horses to carry them over the mountains.

Sacagawea did not guide the expedition through the Rockies, but she continued to aid the expedition whenever they ran into Shoshone speakers. Her presence with an infant child, too, was important since it helped to convince many NATIVE AMERICANS that the expedition was not a

war party. When the couple returned to St. Louis, Captain Clark offered their son an EDUCATION, and the Charbonneaus agreed. They later had a daughter named Lizette. The most reliable sources indicate that Sacagawea died from fever in 1812, but there are some reports claiming she lived on the Wind River Reservation until 1884.

**St. Clair, Arthur** (1736–1818) *U.S. army officer*

Arthur St. Clair was an able but not always successful officer in the REVOLUTIONARY WAR (1775–83) who became the first governor of the Northwest Territory. St. Clair was born in Scotland and joined the British army to fight in CANADA during the French and Indian War (1754–63). He married into the wealthy Boston family of Governor James Bowdoin in 1760. Two years later, he resigned his commission as a lieutenant in the British army and bought a large estate of 4,000 acres in western Pennsylvania. Governor John Penn made him the official agent of the colonial administration on the FRONTIER, where he became embroiled in a boundary dispute with Virginian officials who claimed the forks of Ohio (Fort Pitt) for their colony.

Soon after the outbreak of the Revolutionary War, the SECOND CONTINENTAL CONGRESS appointed him colonel. He personally raised the best regiment in Pennsylvania in only six weeks. “Be the sacrifice ever so great,” he wrote to a friend, “it must be yielded upon the altar of patriotism.” His troops arrived in Canada in 1776, just in time to cover the retreat of the revolutionary army. In the winter of 1776–77, Congress appointed him brigadier general and he participated in the BATTLES OF TRENTON AND PRINCETON (December 26, 1776, and January 3, 1777). In the

spring of 1777, now promoted to major general, Congress ordered him to defend FORT TICONDEROGA to prevent any British invasions from the north. When a superior British force marched on Fort Ticonderoga, St. Clair's decision to evacuate the fort created an uproar since public opinion thought the fortress impregnable. A court-martial under Benjamin Lincoln exonerated St. Clair, but he was never given an independent command again during the Revolutionary War. He worked as aide-de-camp to GEORGE WASHINGTON at the BATTLE OF BRANDYWINE (September 11, 1777), organized exchanges of PRISONERS OF WAR, and recruited soldiers in Pennsylvania.

After the war, he became Pennsylvania's delegate to the Continental Congress from 1785 to 1787. In his last year of office Congress elected him its president and governor of the Northwest Territory. As governor he defended the treaties made in 1784 and 1785 that had deprived the tribes of most of their land. Native-American leaders complained that military compulsion and fraud had coerced them to sign the treaties. In the Fort Harmar Council in 1789, St. Clair sought to play the different tribes against each other but this manipulation backfired and led to war. Native Americans surprised and defeated the larger U.S. army under the personal command of St. Clair in 1791. Again, a congressional committee and George Washington exonerated St. Clair of any guilt for this humiliating defeat, but his political career began to stall.

St. Clair also had a tumultuous career as governor trying to control the settlement of European Americans in the Northwest Territory. As a member of the FEDERALIST PARTY, St. Clair wanted a systematic development instead of the helter-skelter pattern of frontiersmen scrambling to establish themselves on land north of the Ohio River. Not only did St. Clair hope that a more regular progression onto the frontier would limit conflict with the Indians, but it would also establish a moral and well-ordered community modeled after the "eastern states" (New England). In such a world, traditional notions of hierarchy could be maintained. Unfortunately for St. Clair, his vision of the frontier did not reflect the democratic reality of the clamoring free-for-all of squatters, speculators, and conflicting land claims in the region. As a part of St. Clair's effort to restrain the swelling mass of migrants into the Northwest in the 1790s and early 1800s, he sought to prevent the creation of new territories and states. When St. Clair opposed the formation of the new state of Ohio, President THOMAS JEFFERSON removed him from office in 1802. St. Clair died impoverished in 1818.

### **Saintes, Battle of the** (April 12, 1782)

In a major fleet action involving more than 60 ships of the line (vessels with 64 or more guns) on both sides, the British beat the French in the Battle of the Saintes, which saved Jamaica from invasion and allowed the British to recapture several islands in the Caribbean. Ultimately, the battle also contributed to facilitating the TREATY OF PARIS (1783) by reasserting British naval supremacy in the WEST INDIES, allowing the British to take some pride in an otherwise disastrous war and convincing the French that they needed to end the conflict before the costs drove them to bankruptcy.

Admiral COMTE DE GRASSE had hoped to avoid a fleet action when he put to sea from Martinique with a convoy of 150 ships protected by 33 ships of the line on April 8. He planned to rendezvous with a smaller Spanish squadron off Hispaniola, which would provide the numerical superiority that would allow the allies to conquer Jamaica. The British navy, under the command of Sir George Rodney, numbering 37 ships of the line, was intent on preventing that conjunction. Rodney set off in pursuit of the French. On the evening of April 10, two or three of the French ships collided into one another. Rather than abandoning these vessels to the British, de Grasse turned around and engaged the enemy in the water passage between the islands of Guadaloupe and Dominica and near a small chain of islands called the Saintes. After a day of maneuvering for position, both fleets approached each other in what appeared to be a standard naval attack, with each fleet drawn up in a line passing each other and exchanging cannon fire. At this stage, the British had a slight edge because of their gunnery. However, some of the French ships failed to follow de Grasse's signals and adjust their line. Just then there was a slight shift in the wind, and Rodney decided to break with naval tradition. He changed direction of his flagship to cross the French line. Several other British warships did the same. This maneuver allowed the British to rake two French ships simultaneously with batteries on both sides blazing. Once through the line, Rodney had several French vessels surrounded. De Grasse's flagship, the *Ville de Paris*, was pounded so heavily that he was forced to surrender. Another French ship was sunk outright, with the loss of all hands. The blood from the dead tossed overboard had attracted hoards of sharks, making the water a death trap for anyone who fell overboard. The French fleet scattered. Most of the convoy escaped to Guadaloupe, where the ships were protected by the harbor fortifications. Four other French ships were captured that day, and two were seized a week later. More than 3,000 Frenchmen lost their

lives, and France's greatest admiral had been captured. In addition, the *Ville de Paris* contained a huge treasure in gold to pay for the expedition against Jamaica.

As complete as the victory was, there was a downside for the British. Rodney, whose own ships needed repairs, did not destroy the convoy, nor did he pursue the French to annihilation. Within a month the battered remnants of the French fleet met with the Spanish, making their numbers approximately equal to the British in the Caribbean. Moreover, when the captured French ships were sent to England several months later, a hurricane struck, sinking the *Ville de Paris* and other captures, as well as several escorting British ships of war. By that time, however, France, Great Britain, and the United States were ready for peace.

### **Sampson, Deborah** (1760–1827) *soldier*

An adventurous young woman from Massachusetts, Deborah Sampson is the only woman who, disguised as a man, officially served as a soldier during the REVOLUTIONARY WAR (1775–83). One of eight children her father abandoned, Sampson was not yet six when her mother began boarding her outside the home. At 10, Sampson became an indentured servant on a Middleborough farm. There she acquired domestic skills, becoming an excellent spinner and weaver. She also tended the garden and livestock, learned to hunt and shoot, and to wield farm implements as adeptly as her master's eight sons. And she learned to read and write, a privilege not accorded all young women at the time.

The Revolutionary War was into its fourth year when Sampson turned 18 and her indentured servitude ended. She taught school for a time, but she primarily earned her board with various families in the community by spinning and weaving their cloth. Scholars are not exactly sure why Deborah Sampson decided to join the army. Perhaps she was not content with a woman's secondary and largely domestic role in the patriarchal society of the 18th century. Or perhaps she simply wanted the enlistment bonus and to travel to see some of the world. She may have been motivated by patriotism. Whatever her reasons, she acquired men's clothes, bound her breasts, cut her hair, and went to the local tavern to enlist. A tall woman for the period—five feet, nine inches—with a sturdy figure and plain features, Sampson was accepted as a recruit named Timothy Thayer. However, she got drunk afterward and failed to show up for assembly. People questioned the identity of the delin-

quent soldier, and soon Sampson's hoax was exposed. She claimed she had meant it as a joke. However, her local Baptist assembly condemned her action. Sampson was also liable to legal prosecution for disguising herself as a man. Despite these obstacles, she sought to reenlist in the army under a new name.

On her next attempt, Sampson left the familiarity of Middleborough and successfully signed on at Worcester on May 20, 1782, for a three-year term in the fourth Massachusetts Regiment of the CONTINENTAL ARMY. She called herself Robert Shurtliff, taking the first and middle names of a dead elder brother. Her compatriots accepted her guise and teased her for being too young to shave. Fearful of discovery, she became adept at tending to her personal hygiene and laundry needs while almost constantly in the company of men. Even when wounded in action, she managed to extract the musket ball from her thigh and dress the wound herself, avoiding the need for a doctor to undress her. Throughout her service, Sampson performed the tasks put to her as Shurtliff and endured every hardship. No one suspected her true sex. She avoided as much as possible the close living quarters of the large army camp at New Windsor, New York, by serving in an elite light infantry company that was frequently stationed in the field and fighting in the no-man's land between British and Continental lines. She also became a waiter—personal servant—of General John Paterson. This position, too, allowed her some additional

An engraving showing Deborah Sampson, disguised as a man, delivering a message to George Washington (*Library of Congress*)

privacy to hide her true identity and gained her the patronage of several officers.

Falling victim to a fever while in Philadelphia in 1783 proved her undoing. While trying to check the heartbeat of the stricken soldier, a doctor unwound the binding around Sampson's breasts and discovered her secret. It was not until after her recovery, however, that her true identity became generally known. She had promised her sympathetic Philadelphia physician that, upon returning to her regiment, she would personally deliver his letter to her commanding officer. All who knew Private Shurtliff were amazed to learn the truth, and most applauded Sampson's efforts.

Having served 18 months, Deborah Sampson received an honorable discharge at WEST POINT on October 25, 1783. She returned to Massachusetts and to a woman's life, marrying Benjamin Gannett in 1785 and having three children. A 1797 book of her exploits preceded Sampson-Gannett's 1802–03 lecture tour regarding her service in the Continental army. In 1792 she petitioned Massachusetts for her unpaid wages, and in 1818 she applied to the U.S. Congress for a veteran's pension. She was successful in both cases. When she died in 1827 at age 63, her husband asked Congress to continue his wife's allotment. Though Benjamin Gannett did not live to see it, he was the first man awarded a U.S. government pension for military service performed by his wife.

In the late 20th and early 21st centuries, interest in Deborah Sampson increased as she came to represent an individual who rejected gender roles and served as a symbol for women asserting equal rights.

**San Lorenzo, Treaty of** See PINCKNEY TREATY.

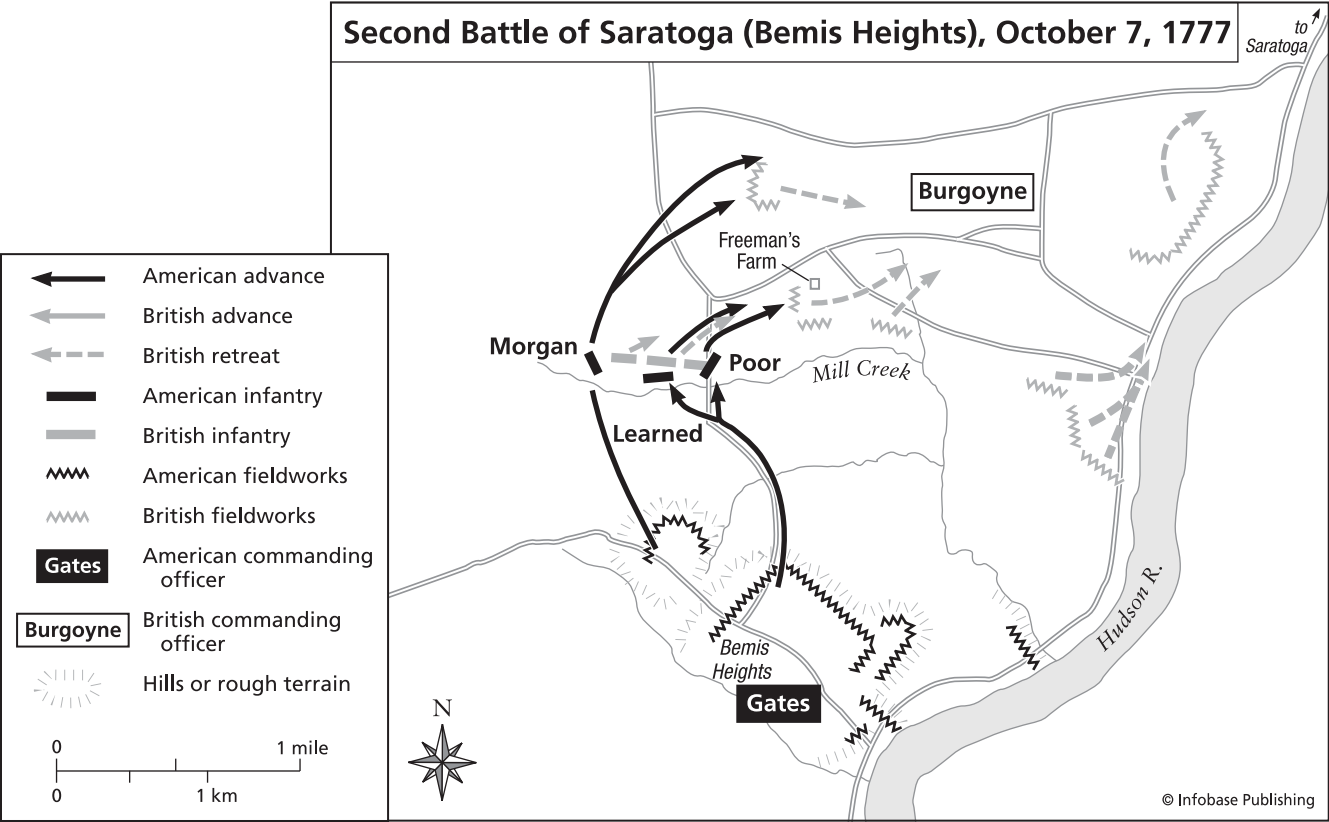

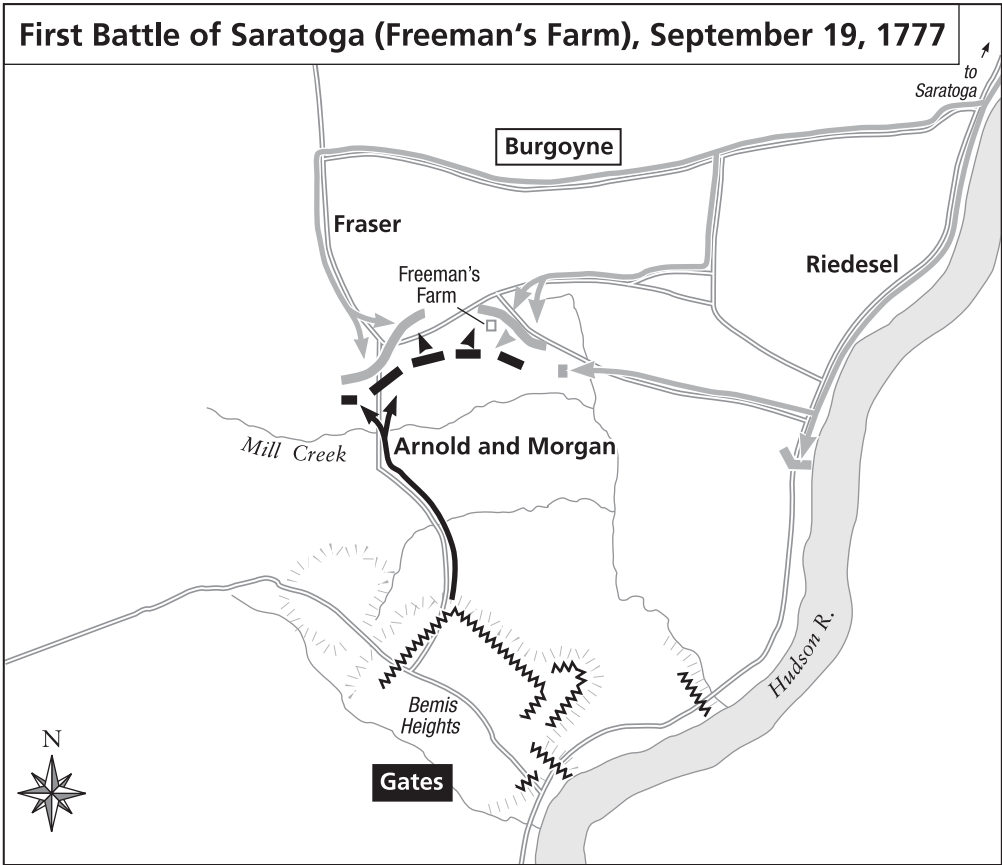

**Saratoga, surrender at** (October 17, 1777)

The surrender of General JOHN BURGOYNE's army at Saratoga changed the course of the REVOLUTIONARY WAR (1775–83). It was the first great victory in the war for the United States, and it convinced the French to join the conflict before the British made peace with their rebellious colonists. It also culminated a campaign that had the potential to harm seriously the cause of North American independence.

Historians have long debated the failure of the British to coordinate their activities in the summer of 1777. As Burgoyne launched an invasion from CANADA, General WILLIAM HOWE, headed in the opposite direction, leaving New York City by sea to attack Philadelphia from the Chesapeake. Lieutenant Colonel Barry St. Leger's thrust from the Great Lakes did not have enough punch to be of much help to Burgoyne either. Criticism of the British for not acting in concert misses an important point. When Burgoyne left Canada with a well trained and well led army, no one thought he needed help. His force of close to 9,000 men was expected to defeat the revolutionaries.

Burgoyne easily captured FORT TICONDEROGA (July 6, 1777) at the foot of Lake Champlain, and his troops defeated retreating revolutionaries at the Battle of Hubbardton on July 7, 1777. At this point his army began to get bogged down by the terrain and the delaying tactics of obstructing the road from Lake Champlain to the Hudson River. Had the British immediately after these victories managed to engage the forces under General PHILIP SCHUYLER, they might well have won the day. Schuyler had only a few thousand men under his command at the time. But Burgoyne did not reach the Hudson until July 30, and his supplies began to run low. To remedy this deficit, he sent a raiding party into Vermont. That unit was almost wiped out at the Battle of Bennington (August 16, 1777). In the meantime, the revolutionary command fell to HORATIO GATES, and reinforcements began to pour into his lines by the thousands.

Gates decided to dig his troops in on Bemis Heights, south of Saratoga on the west side of the Hudson River. For Burgoyne to advance on Albany, he would have to attack Gates, who now held fortified high ground in the British path. Two battles ensued. First was the Battle of Freeman's Farm (September 19, 1777). Burgoyne divided his army into three columns and advanced toward the revolutionaries. This might have provided a wonderful opportunity to defeat the British in detail, since the columns remained separated for most of the battle. Instead, Gates kept the majority of his troops in their entrenchments, allowing only some of his regiments to advance and meet the British attack. Even so, on the scene of the battle, the revolutionaries outnumbered the British by a margin of two to one. The fighting was intense, with the front line of Continentals led by DANIEL MORGAN and BENEDICT ARNOLD. The British column on the right hardly participated in the battle. In the evening, about 500 men from General Friedrich Adolph Baron von Riedesel's column of German mercenaries that had advanced along the Hudson River joined the battle and swept Gates's right. Had Gates listened to the pleas of Arnold, with whom he had a personality conflict, and sent more troops into the fray, the revolutionaries might have won a decisive victory. Similarly, had Gates

attacked the now poorly defended baggage train along the Hudson, he could have destroyed Burgoyne's supplies and left the British army in desperate straits. Instead, Gates himself never got too close to the fighting, and his troops around Freeman's farm had to withdraw to the safety of Gate's entrenched position. Exhausted, the British occupied the battlefield they had won at the cost of 600 casualties. The revolutionaries were still in front of them on Bemis Heights.

Burgoyne should have followed up his tactical victory by assaulting the Continental positions immediately after the fighting on the 19th. Every day he waited, in part in the vain hope that General HENRY CLINTON would arrive with a relief force from New York City, more revolutionary troops arrived on the scene. In the meantime, more of his own men deserted, and his supplies dwindled. Burgoyne ordered his men to dig in a few miles from the enemy lines.

Burgoyne's position was desperate by the time of the Battle of Bemis Heights (October 7, 1777). He had only about 5,000 men left in his army; the revolutionaries numbered more than 10,000. Clinton's expedition up the Hudson captured some forts below Albany, but he could not relieve Burgoyne (see also HUDSON HIGHLANDS CAMPAIGN). Faced with retreat through hostile territory, followed by a large enemy army, and the possible onslaught of winter, Burgoyne decided that his only hope was to smash the enemy in front of him. Unsure of the strength of his opponent's position, Burgoyne ordered a large reconnaissance in force of about 1,500 men to Gates's left flank. These troops were also to cover a foraging party. When Gates saw the movement, he ordered an attack. The British line had been strung out too long, were attacked on both flanks, and driven back. Benedict Arnold, whom Gates had relieved of command after Freeman's Farm, joined the battle of his own initiative. Seeing an opportunity to push the British further, Arnold directed an assault on entrenchments protecting the right of the British encampment. This effort met with mixed results with the revolutionaries overrunning one redoubt but not the other. As night fell both armies separated. Burgoyne's army was shattered. The British suffered almost 900 men killed, captured, and wounded. British losses included many officers, including General Simon Fraser, Burgoyne's most trusted commander. The revolutionaries sustained about 30 to 40 dead and 120 wounded. Arnold was shot in the leg during the last stages of the battle. As in the previous engagement, Gates never got close to the fighting. With the revolutionaries hovering on Burgoyne's right, he retreated to Saratoga in the vain hope that either Clinton would arrive or that he could continue the retreat to Fort Ticonderoga. His hesitation cost him his army. Within a few days, a sufficient number of Gates's troops had fallen behind him that he had to surrender his entire force on October 17, 1777.

Although Gates initially demanded harsh terms for surrender, the eventual agreement was relatively lenient to the British. This convention, as the document of surrender was called, stipulated that the British would march out of their camp, surrender their arms, and then head to Boston where they were to be allowed to return to Great Britain on the promise that these soldiers would never again fight in North America in the war. The Convention Army, as the almost 5,000 surrendered British, German, and Canadian forces were now called, led to controversy. The Continental Congress feared either that the British would ignore the agreement once the troops were released or that the British would simply station the men elsewhere and thereby free up other soldiers to fight in North America. For more than a year the prisoners of war were kept in Massachusetts. In early 1779, they were sent to Virginia, where they waited out the rest of the war. By that time, many of the men had deserted, especially the Germans, and only about half of Burgoyne's army that had surrendered at Saratoga made it back to Europe.

### **Savannah, Battle of** (December 29, 1778)

The British army successfully began its campaign to capture and secure the South with a victory at the Battle of Savannah. In November 1778, General HENRY CLINTON in New York sent Lieutenant Colonel Archibald Campbell with 3,000 seasoned troops to capture Savannah, Georgia. Despite a rough sea passage, Campbell arrived off the Savannah River on December 23, and he landed most of his men unopposed at a plantation about two miles from Savannah on December 29. General Robert Howe of the CONTINENTAL ARMY had stationed a small force on a bluff overlooking the landing place, which was quickly driven off with a bayonet charge by some light infantry. Howe had only about 850 men, but local officials convinced him he should at least attempt to oppose Campbell's advance on Savannah. Howe drew his men up in a good defensive position in front of Savannah. However, a slave informed Campbell of a trail through the marshes to the rear of Howe's line. Campbell sent about 600 men with the slave and waited to strike at Howe until he saw the attack from his flanking maneuver. This combined assault worked with devastating efficiency. As soon as Howe recognized his predicament, he ordered a general withdrawal. Given the circumstances and the inexperienced nature of both the Continentals and the militia, the retreat turned into a rout. The British lost

seven dead and 17 wounded. The revolutionaries suffered at least 83 killed and 453 captured. Campbell also seized vast quantities of stores, including 48 cannon, 23 other fieldpieces, 617 muskets, several ships, and a variety of goods and foodstuffs.

### **Savannah, siege of** (September 1–October 20, 1779)

The siege of Savannah represented the second attempt to coordinate revolutionary and French forces in a campaign against the British in North America. The first effort failed when the French navy under CHARLES-HENRI-VICTOR-THÉODAT, COMTE D'ESTAING was struck by a hurricane as it maneuvered for position to engage a British fleet defending Newport, Rhode Island (see also BATTLE OF RHODE ISLAND). Stung by criticism that he did not do all that he could to assist the revolutionaries in 1778, d'Estaing sought to redeem himself by driving the British out of Georgia in 1779. He thus committed his fleet and army to attack Savannah in September even though it was hurricane season along the North American coast.

D'Estaing's fleet surprised the British when it arrived off the Savannah River on September 1, 1779. Unsure of French intentions, General Augustine Prevost prepared to abandon his outlying posts and concentrate his army at Savannah. D'Estaing in the meantime arranged to rendezvous with the CONTINENTAL ARMY under General Benjamin Lincoln on September 11. The French troops started coming ashore on September 9, but it would take longer for the revolutionaries to arrive. Perhaps d'Estaing should have attacked immediately before the British were fully prepared; instead, he delayed. He waited for Lincoln and entered into negotiations for the city's surrender. Prevost stalled and made believe that he was considering surrendering. In the meantime, his troops and requisitioned slave labor continued to dig fortifications and to prepare defenses. In addition, he brought another 800 regulars into the city from Beaufort via intercoastal waterways, which were unguarded by either the French, who blocked the seaward passage, or the Continental army, which guarded the land routes. By the time the siege opened in earnest on September 22, the British had about 4,800 soldiers in Savannah manning carefully designed fortifications in five layers. The French had about 4,500 troops and complete naval superiority, while the revolutionaries had around 3,100 men.

Between September 22 and October 3, the French built trenches and brought their artillery into position. Occasional British sorties disrupted this work, but the

French were able to begin their bombardment of Savannah at midnight on October 3. Although the allied forces used 57 guns to lob shells into the city, after several days of artillery fire, d'Estaing decided to avoid a prolonged siege and launched a direct assault on the British on the morning of October 9. D'Estaing's plan was to concentrate his forces on one redoubt—called Spring Hill—and have several smaller groups tie down the British elsewhere with feints. However, d'Estaing mismanaged his preparations, and his men were delayed in getting into position. Instead of launching a coordinated attack at 4:00 A.M. before the sun rose, d'Estaing led only a few hundred men in a fixed-bayonet charge at dawn as the British discovered the pending battle. As unit after unit came into position, the French continued with this piecemeal approach. Continentals and militia also joined the fray. British musket fire and cannon grape shot inflicted major casualties during these uncoordinated attacks by the revolutionaries and the French. At one point General CASIMIR PULASKI arrived on the scene and sought to carry the day by leading his cavalry into the heat of the battle. Pulaski was fatally wounded, and the cavalry beaten back. D'Estaing was wounded in the arm in the first wave of attack, but he continued to rally his troops only to be shot in the leg. The French and revolutionaries pulled back in disorder and were saved from total disaster when the French rear guard broke up a British counterattack.

The casualties for the allies on October 9 were very heavy: The revolutionaries lost 58 killed and 181 wounded; the French lost 59 killed and 526 wounded; the British lost only 16 killed and 39 wounded. Perhaps as important as the overall losses, which for the entire campaign totaled almost 1,000 men for the allies and not quite 300 for the British, was the dismal sense of failure and the recriminations between the French and the revolutionary Americans. Moreover, without the British success at Savannah, the British would not have launched an invasion into South Carolina in 1780.

### **Schuyler, Philip John** (1733–1804) *Continental army general*

Philip John Schuyler was an accomplished soldier, statesman, and revolutionary. He first rose to prominence as a member of the Albany city council in 1756. His land holdings and political career grew, securing a place for Schuyler among the provincial gentry.

Credited with distinguished service in the French and Indian War (1754–63), Schuyler was elected in 1768 to the New York colonial assembly. In the revolutionary atmosphere of the 1770s, he was selected to be a delegate to the SECOND CONTINENTAL CONGRESS. In June 1775, GEORGE WASHINGTON named Schuyler one of four major generals, assigning him command of the Northern Department of New York. While planning the campaign of 1775–76 in CANADA, recurring attacks of rheumatism forced Schuyler to delegate operational command to General RICHARD MONTGOMERY, who went on to capture Montreal. Montgomery's defeat at the BATTLE OF QUEBEC (December 31, 1775), coupled with the loss of FORT TICONDEROGA (July 6, 1777), discredited Schuyler. He was replaced by HORATIO GATES. Schuyler's personal loss was compounded shortly before the British surrender at SARATOGA (October 17, 1777), when British forces sacked his New York estate. Schuyler wanted to clear his name and, in October 1778, demanded a court-martial. Although acquitted with honor, Schuyler resigned from the military.

After the war he held a series of public offices, including intermittent service in the New York State senate and the U.S. Senate. He advised the FEDERALISTS in their drive to ratify the UNITED STATES CONSTITUTION and remained a close friend to Washington. Schuyler and his wife, Catharine Van Rensselaer, had 15 children; eight survived childhood, including one daughter who married ALEXANDER HAMILTON. Schuyler died in 1804.

## science

The expansion of new areas of settlement, the preoccupation with fighting the REVOLUTIONARY WAR (1775–83), and the creation of a new nation left little room for purely theoretical science in the United States. Practical science became dominant—called natural philosophy at the time—and included biology, botany, invention, and the physical sciences.

There were two kinds of pure scientists in this period: those who had the money and leisure to pursue their investigations independently and those who taught at colleges. Because of the religious orientation of most institutions of higher learning before the Revolutionary War, science was not initially an important part of the curriculum. Thus most scientists were independent scholars. After the war,

the number of colleges expanded, and science became regularly taught. Despite the addition of science to the curriculum, the universities were still only training undergraduates, not postgraduate scientists.

The pursuit of science also depended upon communicating the results of study. Before the 1760s, no major scientific societies existed in British North America. Therefore, most of the publications by colonial scientists appeared in the *Philosophical Transactions of the Royal Society*, a journal produced by the Royal Society of London. This participation in an English scientific society diminished in the decade preceding the Revolutionary War, due mostly to the RESISTANCE MOVEMENT (1764–75) but also to the rise of two important North American societies. The first appeared in Philadelphia and was called the AMERICAN PHILOSOPHICAL SOCIETY (1769). BENJAMIN FRANKLIN helped to attract scientific interest in the City of Brotherly Love with his experiments and lectures on electricity. The second major society was American Academy of Arts and Sciences (1780) established in Boston.

Government provided little support for science. A survey of the active scientists of the time and their work illustrates the crucial role that individual men played in the foundations of science in the United States. In the realm of theory, mathematician Robert Adrian independently proved the law of least squares, and Theodore Strong proved Stewart's circle theorem in 1814. Born in colonial America, Benjamin Thompson (Count Rumford) went into exile after the Revolutionary War because of his work as a spy for the British. He was, however, an important physicist whose investigations on heat served as the foundation for the modern theory on the mechanical nature of heat.

Most science in this period was not theoretical; instead, it was practical and observable. DAVID RITTENHOUSE was an important Philadelphian astronomer and inventor, proficient in practical and observational astronomy. In 1769 he built the first astronomical telescope in British North America, and in 1793 he discovered a comet. Another important astronomer was W. C. Bond, an untrained instrument and clockmaker who later became the director of Harvard College Observatory. In 1811 he discovered a comet, using the telescope he had set up in the parlor of his home. Robert Hare was a professor of chemistry who invented two important tools for chemical analysis: the oxy-hydrogen blowpipe, in 1801, and the deflagrator, a device that created a powerful electric arc, in 1820. In geology, Amos Eaton published his famous work, *Index to the Geology of the Northern States*, in 1818.

North Americans were active in botany and zoology. Scientists in Europe were interested in North American flora and fauna for comparative study. In the early colonial period, the emphasis was on collecting plants and ANIMALS to be shipped back to Europe for study and analysis. In the

late colonial and revolutionary periods, North American scientists began to undertake their own study and publish their own collections of data. The foremost botanist of colonial America was John Bartram. He traveled extensively throughout the East Coast collecting plants and seeds. He exchanged information, as well as specimens, with many of the leading European botanist of the time. He published two books, one on the area from Lake Ontario to Pennsylvania, in 1751, and one on FLORIDA, in 1766. Benjamin Smith Barton, W. P. C. Barton, Jacob Bigelow, Thomas Nuttall, and John Terry all published important botanical works in the early 19th century. The two Bartons were an uncle and nephew who worked as professors at the University of Pennsylvania. Bigelow and Nuttall were both students of Benjamin Smith Barton, and Terry was a doctor who worked as a professor at WEST POINT, Princeton, and Columbia. In zoology, the work of Alexander Wilson was the most important of this time. Born in Scotland, he moved to Philadelphia in 1794. In 1802 he met the son of John Bartram, WILLIAM BARTRAM, who stimulated his interest in ornithology. From 1808 to 1813 he published the seven volumes of his work *American Ornithology*.

Practical inventors and tinkerers had the greatest impact on society. While not trained scientists, such men

pushed technological innovation in important directions. SAMUEL SLATER left England in 1789 with the blueprints of textile machinery in his head. He built the first successful textile factory in the United States and began the INDUSTRIAL REVOLUTION in North America. ROBERT FULTON experimented with the steam engine as a means of driving boats on rivers. His steamboat, the *Clermont*, transformed communication and transportation within a decade of its first appearance on the Hudson River in 1807. And ELI WHITNEY's cotton gin altered the course of AGRICULTURE in the South and allowed for the establishment of the Cotton Kingdom.

Stearns, *Science in the British Colonies of America* (Urbana: University of Illinois Press, 1970).

## Scots-Irish

More properly called Ulster Scots, these 18th-century immigrants were one of the largest and most important minorities in the British North American colonies. Their hostility to English rule and their antiauthoritarian attitudes made them an important factor in the events of the revolutionary era, especially on the FRONTIER where they were often in the majority.

The Ulster Scots were part of a large migration from Scotland to Northern Ireland in the early 17th century. The English intended to pacify the Irish CATHOLICS of the north by introducing a loyal population of Protestant landowners. They enticed the Presbyterian Scots with land grants and other incentives, but the arrangement was never a satisfactory one. The Scots-Irish experience in Ireland only served to intensify their hatred of the English. By the 18th century they had become objects of ethnic, religious, and economic discrimination. Irish Catholics hated them, and the Anglo-Irish considered them inferior. As Presbyterians they were religious nonconformists, and laws such as the Test Act of 1704 excluded them from government jobs and attendance at universities. Making matters worse, the British Navigation Acts gave English industries preference over those in Ireland and unfair taxation further magnified the sense of grievance.

Poor harvests and an economic depression in the early 18th century made conditions unbearable for many Ulster Scots. Around 1717 there began an exodus to the North American colonies. This movement made up

David Rittenhouse constructed the first working model of the solar system in 1767 and built an observatory to watch the movement of Venus. Engraving (Library of Congress)

part of a broader migration of “border Britons,” including the Scots, Welsh, Irish, Cornish, and the Scots-Irish from the periphery of the British Isles to the colonies. Between 1717 and 1775 over 250,000 Scots-Irish crossed the Atlantic to settle in British North America. At the beginning of the REVOLUTIONARY WAR (1775–83) the Scots-Irish comprised roughly 10 percent of the colonial population.

On arriving in the colonies, many Scots-Irish moved into the backcountry. The move to the frontier partly resulted from POVERTY and the need for cheap land. It also reflected a desire to settle as far as possible away from the English, who dominated the coastal areas. By the mid-18th century, the Scots-Irish could be found in the western portions of most colonies. The largest number settled in the lands in the western sections of Pennsylvania, the Carolinas, and Georgia. By the last quarter of the 18th century, the Scots-Irish were moving west across the Appalachians.

In many respects the Scots-Irish were ideal frontiersmen. They were tough people, hardened by years of bad fortune and worse treatment. On the frontier they often lived in isolated settlements and under trying conditions. Celtic tribal values governed these frontier communities. The Scots-Irish were proud and protective of their honor and took their RELIGION seriously, but drinking and violence were also a part of their heritage. However, rich traditions of hospitality, MUSIC, and storytelling softened the rigors of frontier life.

Their toughness was sometimes a disadvantage. As settlements moved westward, the Scots-Irish increasingly came into contact with NATIVE AMERICANS for whom they had only disdain. The resulting violence threatened settlements and upset trading patterns between the tribes and eastern merchants. This conflict forced colonial governments to bear the expense of sending troops to protect the frontier. Further complicating matters, the backcountry folk were frequently at odds with their own colonial governments concerning issues of unfair taxation and lack of representation.

The years from 1740 to 1765 were full of tension and conflict in the colonies. The Scots-Irish were often involved in such backcountry disturbances as the Paxton Boys revolt in Pennsylvania (1763) and the Regulator movements in the Carolinas (1766–70). Many resisted the PROCLAMATION OF 1763, which was intended to limit access to the country west of the Appalachians.

The large Scots-Irish population guaranteed the importance of Presbyterianism, and when evangelical revivals swept the colonies in the 1730s, the Irish evangelist William Tennant and his sons found a ready harvest among the Scots-Irish in the middle colonies. This Great Awakening was in many respects a precursor to the AMERICAN REVO-

LUTION, encouraging sectarianism, individualism, and anti-authoritarianism, attitudes that were common among the Scotch-Irish. Concern that an Anglican bishop would be appointed for the colonies at times drove them to cooperate with QUAKERS and other groups who shared their fear (see also ANGLICAN CHURCH).

During the early national era, the Scots-Irish continued to be an important factor on the frontier, spearheading westward expansion and playing an increasingly active role in the politics of the new republic. Scots-Irish culture was particularly influential in the South and the West where its values formed part of the core of those emerging regional cultures.

### Seabury, Samuel (1729–1796) *Episcopal bishop*

LOYALIST spokesman and a founder of the Protestant Episcopal Church, Samuel Seabury was born in Groton, Connecticut on November 30, 1729. He was the son of wealthy parents who encouraged him to pursue an advanced EDUCATION. He graduated from Yale College in 1748, became a doctor shortly after studying MEDICINE at the University of Edinburgh between 1752 and 1753, and was ordained in the ANGLICAN CHURCH before returning to New England.

After being made a missionary by the Society for the Propagation of the Gospel, Seabury preached to followers in New Brunswick, New Jersey, between 1753 and 1757. He then moved to Jamaica, New York, to serve as a parish rector. In 1766 he moved yet again, this time to Westchester, New York, where he became a leading figure in the community.

A devout Loyalist, Seabury noted with alarm the drift toward revolution in British North America after 1773. In 1774–75 he wrote pamphlets opposing the formation of the FIRST CONTINENTAL CONGRESS under the name A. W. Farmer (as in a Westchester farmer). These essays questioned the authority of the Congress and viewed the local WHIG committees as nothing more than “half a dozen foolish people” who had chosen themselves to speak for the community. Seabury also argued that the real threat to liberty did not come from the king. Instead, Seabury asserted, “the bands of civil society” were broken and “the author-

ity of government weakened” leading to individuals being “deprived of their liberty” and their “property is frequently invaded by violence” through “a flagrant instance of injustice and cruelty committed by a riotous mob.” His activities in support of the Crown eventually led to his arrest and brief imprisonment by supporters of the Revolution. He escaped from prison and fled to New York City and the protection of the British in 1776, and he lived there for the duration of the REVOLUTIONARY WAR (1775–83) as a doctor, political essayist, and cleric.

Seabury led the Loyalist exodus to Nova Scotia when the war ended in 1783, but his widely admired work in the church led Connecticut’s Anglican clergy to name him a bishop in spite of his opposition to the creation of the United States. Church officials in England refused to consecrate him for fear of meddling in internal American affairs, but the Scottish Episcopal Church did, and Seabury returned to North America as the rector of St. James’ Church and the bishop of Connecticut. He quickly organized a diocese centered on New London, and in 1789 he helped form the American Protestant Episcopal Church. In 1793 he published a collection of sermons titled *Discourses on Several Subjects*, and in 1798 (two years after his death) supporters revised and added to the collection, publishing it as *Discourses on Several Important Subjects*. Seabury died in New London on February 25, 1796, and he left behind a formidable legacy as a defender of New England’s High Church.

## Shakers

The United Society of Believers in Christ’s Second Appearing, more commonly known as the Shakers, established religious communities in the United States in the last decades of the 18th century. Members of this millenarian sect practiced celibacy, publicly professed their sins, and engaged in hard labor—creating a unique style of ARCHITECTURE, furniture, and handicraft, which was distinct in its functional simplicity and fine workmanship.

The founder of the American Shakers was ANN LEE, a Manchester-born woman who moved from England to North America in 1774. Lee, known to her followers as Mother Ann, was perceived as the female embodiment of Christ’s dual nature. Lee’s early influences derived from the Wardley Society, a radical offshoot of the QUAKERS, which she joined in Manchester in 1758. The members of the Wardley Society distinguished themselves by their unique

form of worship, which included shaking, trembling, dancing, shouting, and generally motioning their bodies in a chaotic manner, thus earning them the name “Shaking Quakers.” Lee led a group of eight across the Atlantic to North America, landing in New York in 1774. They established a community near Albany, New York, called Niskeyuna (now Watervliet) in 1776, although through revivals and preaching tours their influence extended well beyond their modest community.

The Shaker movement was deeply influenced by the prevalent millennial beliefs of the late 18th century. Many millenarian sects believed that the “judgment day” was near, and through their devout faith and practices, they would ultimately be saved. Shakers established celibacy as a principal tenant of their sect—since the end was near, there was no need to procreate. New members came from either conversions or adoptions. Further, Mother Ann believed that sexual relations impeded one’s relationship with God. Between their “shaking” ritual and their celibacy, the Shakers were ridiculed and scorned by other religious denominations of the period. However, they garnered admiration from their contemporaries for the order, simplicity, and prosperity of their farming communities. Their labor and ingenuity resulted in a number of unpatented inventions as well as a distinct design of architecture (usually barns) and furniture. Shakers designed furniture without needless decoration, reflecting their conviction that the appearance of an item should follow its function. Since Shakers viewed the process of constructing goods as in itself an act of prayer, austere Shaker furniture reflected the piety and fine workmanship of its creator.

Mother Ann died in 1784 and, shortly thereafter, elders in the sect structured their followers into a communal pattern that served as the model for Shaker communities throughout the early national period. The first Shaker community, established on this model in 1787, was located at New Lebanon, New York. It served as the center for the Shaker RELIGION as the movement gradually spread to New England, Kentucky, Ohio, and Indiana. The period between 1774 and 1820 represents the building stage for Shakerism in the United States; by 1826, there were 18 Shaker villages in eight states. By the end of the 19th century membership steadily declined, and today there are few surviving Shakers.

**Shays's Rebellion** (1786–1787)

In 1786 and 1787 farmers in western Massachusetts, following patterns of crowd behavior practiced in the RESISTANCE MOVEMENT (1764–75), closed courts, freed men imprisoned for debt, and fought with government forces. Because Daniel Shays, a former revolutionary army captain, led some of this action this insurrection was called Shays's Rebellion. FEDERALISTS cited this uprising, which occurred shortly before the meeting of the CONSTITUTIONAL CONVENTION in Philadelphia in the summer of 1787, as an argument for the creation of a stronger national government.

The postwar years of the 1780s were a period of economic turmoil. When British creditors demanded payment from eastern New England merchants in the mid-1780s, these businessmen had little choice but to shift the burden onto their debtors—those who lived in the countryside. But with low prices for their products, and almost no cash, the rural debtors could not meet their obligations. Compounding these difficulties, the government of Massachusetts had imposed high taxes to pay the state debt from the REVOLUTIONARY WAR (1775–83), especially for the costs of the failed PENOBSCOT CAMPAIGN (July 25–August 14, 1779). This policy to repay the debt favored eastern speculators who had purchased state notes at a discount, often from soldiers and farmers, and now expected the state to pay full value. The rebels lambasted the state constitution, which seemed to favor the rich as a “tyrannical government” and complained that the legislature was compensating speculators in full, a policy that rewarded men who had “sauntered at home during the war, enjoying the smiles of fortune, wallowing in affluence, and fattening in the sunshine of ease and prosperity.” These grievances were real—the average Massachusetts farmer in the mid-1780s had to pay six times the amount of taxes they had to pay King GEORGE III before the Revolutionary War. Pressed by creditors and tax collectors, farmers in western Massachusetts sought tax relief from the legislature and asked to pay their debts with paper money or commodities instead of specie. These pleas were rejected by members of the upper house, who were more sympathetic to eastern creditors and merchants.

Faced with the threat of losing their property and livelihood to pay taxes and debts, poor farmers in western Massachusetts formed committees and held conventions to condemn the government, and they began closing courts in the summer and fall of 1786. Many of these men had been in the forefront of the revolutionary movement, having served in the CONTINENTAL ARMY or WHIG militia. They wondered how the government could forget their sacrifices in the name of “liberty.” With a force that numbered as high as 2,000 men, the rebels reached a turning point that winter when they tried to capture the arsenal at

Springfield, Massachusetts. Fearing a large-scale uprising, nervous eastern merchants contributed money and lobbied state officials to recruit an army to put down the rebellion. The state government ordered 600 men, led by General William Shepard, to Springfield. Confronted by armed rebels under the leadership of Shays on January 25, 1787, a nervous Shepard fired cannon into the crowd, killing four and wounding at least a score of others. Over the next few weeks, the state militia from eastern Massachusetts, led by General Benjamin Lincoln, defeated the rebels in several encounters. Daniel Shays and other rebel leaders had to flee the state.

While this movement for debtor relief was most intense in Massachusetts, similar actions occurred elsewhere in 1786 and 1787. In New Hampshire, angry farmers surrounded the legislature in the state capital in an effort to have their grievances redressed. Crowds also closed courts in Rhode Island, Maryland, and South Carolina to prevent legal action against debtors. Governor GEORGE CLINTON of New York was so concerned with the spread of the disorder that he ordered the apprehension of any Shaysites who sought to escape to his state. Once the authorities in Massachusetts had regained control in the western part of the state, they were relatively lenient, pardoning all but Shays and three other leaders almost immediately, and then pardoning the rest later. Ironically, too, the next round of elections swept debt relief supporters into the legislature, which then passed measures to ease the situation.

Although the rebellion did not seriously threaten the stability of the state or national government, Federalists argued that the Shaysites had exposed a flaw in the structure of the national government. The government under the ARTICLES OF CONFEDERATION had been ineffectual in suppressing the uprising. Similarly, the Federalists claimed that the insurrection revealed the impotence of the national government in dealing with economic problems. Both positions ignored the fact that the state government had successfully suppressed the rebels, and eventually dealt with the economic distress of its citizens. Regardless of the ability of Massachusetts to solve its own difficulties, the aftermath of Shays's Rebellion played a significant role in the framing and RATIFICATION OF THE CONSTITUTION.

**Sherman, Roger** (1721–1793) *signer of the Declaration of Independence*

A leading figure in the FIRST CONTINENTAL CONGRESS, the SECOND CONTINENTAL CONGRESS, and author of the Connecticut Compromise at the CONSTITUTIONAL CONVENTION, Roger Sherman is perhaps Connecticut's most prominent revolutionary leader. The third of seven children raised by William Sherman and his second wife Mehetabel, he was born in Newton, Massachusetts, on April 19, 1721. Sherman moved to Connecticut when he was a young man, and worked as a shoe cobbler and county surveyor before being admitted to the bar in 1754. With a license to practice law in hand, he then threw himself into colonial politics.

Sherman was elected to the Connecticut General Assembly in 1755, served as a justice of the peace for Litchfield County between 1755 and 1761, and then moved to New Haven to become a successful retail merchant. Sherman was a judge in New Haven in 1765–66 and a superior court judge between 1766 and 1789. During those years he became an ardent supporter of independence, attending Congress from 1774 to 1781 and from 1783 to 1784. He agreed to the cession of Connecticut's western land claims, helped codify Connecticut laws in 1783, and was elected mayor of New Haven in 1784.

Three years later he was one of Connecticut's delegates to the Constitutional Convention, where he proposed the Connecticut Compromise to break a deadlock between large and small states regarding the manner in which congressional seats were apportioned. States with large populations argued for representation based on the number of people in each state, while states with smaller populations feared political obscurity in such an arrangement and pushed for equal representation for every state. Sherman proposed a bicameral Congress in which representation in the upper house (the Senate) was the same for every state while in the lower house (the House of Representatives) it was based on population. The compromise appeased parties on all sides, and proved one of the key building blocks on which the Constitution was based.

A devout Christian and the father of 15 children via two wives, Sherman was a member of the House of Representatives from 1789 to 1791 and of the Senate from 1791 until his death in 1793. He is famous for having signed each of the key documents associated with the creation of the United States: the Articles of ASSOCIATION (1774), the DECLARATION OF INDEPENDENCE (July 4, 1776), the ARTICLES OF CONFEDERATION (1781), and the CONSTITUTION OF THE UNITED STATES (1787). No one else signed all four.

—Lance Janda

**Slater, Samuel** (1768–1835) *industrialist*

Samuel Slater was a British immigrant to the United States who developed the first mechanized COTTON textile mill in the United States. Slater grew up in Belper, England, and began an apprenticeship to Jedediah Strutt, a local textile mill operator, in 1783. As Strutt's apprentice, Slater learned the mechanics, finance, and labor organization of a typical English textile mill. The British government had imposed regulations forbidding anyone with knowledge of textile machinery from leaving the country, consequently, when Slater left for the United States in 1789 he had to wear a disguise and hide his identity. Soon after arrival in the United States, he met Moses Brown and William Almy, two entrepreneurs from Providence, Rhode Island. Almy and Brown had attempted to build a textile factory, but they needed the expertise of an experienced mill operator. Slater, Brown, and Almy formed a business partnership for which Brown and Almy would provide funds for Slater to build and run a textile mill in Pawtucket in exchange for a half-share in the venture.

The mill was driven by waterpower and Slater developed a special labor system. By 1792 whole families found employment in the mill, including children aged seven to 12. Slater sometimes ran into opposition from fathers who resented the paternal authority he expressed towards the child workers. These difficulties led Slater to strive to form meaningful partnerships with families, and prompted him to allow a high degree of family autonomy in the mills. More significantly, he found himself caught between the profit driven Almy and Brown and the worker families when conditions deteriorated and pay was too low to feed the children adequately. He tried in vain to convince Almy and Brown to improve conditions and provide more pay. Consequently, the families struck the mill in 1795 and 1796.

The partnership between Almy, Brown, and Slater broke down after a decade, with the two venture capitalists losing faith in the determined Slater. Meanwhile, Slater found other partners in Providence and set about replicating the Pawtucket mill in other New England states, New York and Pennsylvania. By 1810 approximately 15 mills operated in the northeastern states, with Slater holding financial interest in three. Slater personally put up funds to build more textile mills in New England between 1810 and 1830. Other Slater-style mills appeared; by 1820 there were literally hundreds of mill towns in the Northeast. The Slater mills system also provided a partial model for

entrepreneur Francis Cabot Lowell and others who built a large textile operation around Waltham, Massachusetts, beginning in 1813. Lowell and his partners developed an alternative system known as the Waltham or Lowell system, in which girls and young women were recruited to leave their families to work in the mills. Slater's mill operations continued well into the 19th century under the name Slater and Sons.

## slavery

Although North American slavery accounted for a relatively small proportion of New World slaves, it assumed increasing importance worldwide during the 19th century and North American slavery became a focal point of debates over justice and humanity by the time of the American Civil War. In part, this had to do with the paradox of slavery in the world's leading democratic republic; it also stemmed from the increasingly public debates over slavery and ABOLITION waged in politics and social life in the United States, debates that dated to the era of the AMERICAN REVOLUTION.

Slavery's roots on North American soil dated to the early 1600s, when British colonists began importing slaves as laborers. For a century prior to this time, the colonial powers of Portugal and Spain had dominated the international SLAVE TRADE. Nevertheless, from 1619, when a ship landed at Jamestown with 20 "Negroes," through the 1860s, slavery became a definitive part of Anglo-American culture. North American slave systems diverged from Old World bondage in two ways. First, slavery existed in perpetuity. This meant that all descendants of the enslaved person—usually following the mother's status—were themselves enslaved. The only way to attain freedom was to run away or to be freed by a private manumission (which might require special permission from the colonial legislature). Second, North American slave laws defined bondage in racial terms. In Virginia during the 1660s, new slave laws differentiated between white indentured servitude and black slavery: The former was a temporary status, the latter permanent. By the early 1700s, every North American colony sanctioned slavery in such a statutory manner. In short, slavery and race became intertwined in British North America.

Slavery's growth paralleled that of the British-American colonies. Planters in Virginia and Maryland turned to slave labor to cultivate tobacco during the 1600s. By the

time of the REVOLUTIONARY WAR (1775–83), Chesapeake slaveholders would own the largest number of slaves in the new nation. Beginning in the early 1700s, South Carolina slave owners utilized slaves for rice production. Labor needs and racial attitudes combined to make slavery an integral part of colonial life. In southern colonies, enslaved people worked often on plantations, but, particularly in the middle colonies of Delaware, Pennsylvania, New Jersey, and New York, they might also work on smaller farms, in urban settings, and at sea as mariners. In Massachusetts and Connecticut, where the overall population of enslaved persons remained relatively small, slaves worked as household servants and did other menial tasks.

Slavery was a significant part of the North American ECONOMY. Cash crops such as tobacco and rice commanded worldwide markets for slave owners, not to mention wealth for colonial merchants and British agents. Slavery also indirectly shaped North American enterprise. Before independence, the North American colonists constituted an integral part of the Atlantic world and had an extensive trade network that provided slave-based economies in the WEST INDIES with vital foodstuffs and other products. Many colonial farmers, fishermen, lumberjacks, and, of course, merchants thus obtained a part of their livelihood from this exchange. After the Revolutionary War, even though much of the trade with the West Indies was technically prohibited by the European colonial powers, it continued. North American involvement with the Atlantic world of slavery was often even more direct. About one-seventh of the New England shipbuilding business was engaged in the overseas slave trade before 1800.

Slavery grew for both technological and ideological reasons during the early republic. The development of the cotton gin rejuvenated slavery by making COTTON production more efficient and profitable. During the 1780s, as tobacco prices sagged and some Chesapeake slave owners began embracing ANTISLAVERY schemes, planters of the Deep South saw a possible future in cotton production and began experimenting with cotton machinery to separate seeds from cotton. ELI WHITNEY's invention merely improved upon this machinery. At the same time, slaveholders in South Carolina, Georgia, and North Carolina expressed proslavery sentiments that were aimed squarely at undercutting the early abolition movement. When Pennsylvania QUAKERS presented a petition seeking an end to the overseas slave trade in the first federal Congress in 1790, representatives from both Georgia and South Carolina harshly criticized them. Southern society relied on AFRICAN-AMERICAN bondage, these men argued. Without slaves to clear fields, drain swamps, plant and harvest crops, and engage in other forms of backbreaking labor, they claimed that their economy and society would be hampered. The petition was accepted but not acted upon.

During the second half of the 18th century and the first few decades of the 19th century, the institution of slavery underwent a number of important transformations. For the first time in Anglo-American culture, an abolitionist movement appeared to put slavery on the defensive. Until about the 1750s, most of the major religious institutions in Anglo-American culture sanctioned bondage. The Society of Friends, better known as Quakers, initiated the first attack on slavery during the 1750s and 1760s when it forced slaveholders from their ranks. During the revolutionary era, many conscience-stricken slave owners emancipated slaves by private deed. And abolition gained a foothold in politics and law. In 1780 Pennsylvania became the first state in the new union to adopt a gradual abolition statute by which newly born slaves would be slowly freed over the next several decades. Between the 1780s and early 1800s, every other northern state would banish bondage through constitutional, legislative, or judicial action. By 1812 there were still slaves in the North, but slavery was on its way toward extinction in the region above the Ohio River and north of Maryland.

In the South, on the other hand, slavery expanded and became an increasingly sectional institution, spreading into many new states and territories: Kentucky and Tennessee in the 1790s; Alabama, Arkansas, FLORIDA, Mississippi, and Missouri during the next few decades. In 1790 the first federal census (which although it contained some errors remains a reliable gauge of slavery at the time) counted more than 700,000 bondspersons and more than 60,000 free people of color. By 1830, according to the census, the number of slaves had more than doubled. By the Civil War, the number of slaves would total 3.5 million. Since slave importations were limited during this period—only a trickle of slaves arrived illegally after federal law abolished the international slave trade in 1808—this growth largely resulted from a natural increase. There was a rough balance in the North American slave population between males and females. Although not sanctioned by law, slaves often married and raised families. This development helped foster an emerging African-American culture but was tempered by the power of the white slave owner who could at any moment sell family members, separating husbands and wives, parents and children. Slave owners could also disrupt families by sexually exploiting females or physically punishing any family member.

The study of slavery has changed significantly over the past 30 years, emphasizing more than ever the lives, struggles, and worldviews of the enslaved. Enslaved people created many defensive mechanisms to survive bondage. Resistance included running away, both to achieve freedom itself and to protest particularly harsh treatment; sabotage and work slowdowns; and outright rebellion. The revolutionary era saw a substantial number of runaways,

Most of the founding fathers from the southern colonies, including Thomas Jefferson and George Washington, owned slaves. Washington is depicted here with slaves on his estate in Mount Vernon. Lithograph by Currier & Ives (*Library of Congress*)

in large measure due to the Revolutionary War. Virginia's last royal governor, JOHN MURRAY, EARL OF DUNMORE, issued a proclamation promising freedom to all slaves fleeing owners involved in the rebellion. Whether or not they knew of Dunmore's offer, several thousand African Americans ran to British-controlled territory, especially New York City and Charleston. For decades after the war, a number of slave rebellions occurred in southern states: In 1794 a slave rebellion was planned and foiled in Southampton County, Virginia; in 1800 one of the most famous slave plots (GABRIEL'S REBELLION) was uncovered outside of Richmond, Virginia, but torrential rains and betrayals wiped out the conspiracy before it started; and in 1811 a large uprising occurred outside Natchez, Mississippi. In Gabriel's Rebellion at least one slave made the connection between the revolutionary ideology of the age and the liberation of slaves explicit by declaring at his trial: "I have nothing more to offer than what George Washington would have had to offer, had he been taken by the British . . . I have ventured my life endeavouring to obtain the liberty of my countrymen, and am a willing sacrifice in their cause." Such slave rebels sought to close by violence the contradictions between American slavery and American freedom, believing that slave owners would never emancipate enslaved people of their own volition.

The formation of a solidified slave culture was also an important mechanism of survival for bondspersons. Generally defined as a melding of African and Western religious principles and customs under slavery, slave culture was much more than that. Slave culture represented the beginning of a black nationalist ethos with direct connections to African custom and belief. It also took the more practical form of community values shaped from a common

experience of oppression—a web of relationships and ideas that offered black families strength in the face of constant threats of violence and separation. Finally, slave culture formed an autonomous space from oppressive European-American society, where enslaved people might simply carry on certain religious practices and celebrate in a particular manner. Slave culture might include transcendent customs such as the ring shout, a dance derived from African religious ceremonies. It might also include such things as naming practices: While slaveholders often insisted on naming slave children (as a means of control), African Americans renamed them in honor of ancestors, parents, and African customs.

Slave culture was not uniform throughout the United States, however. The type of slave system, as well as geography, influenced the formation and deeper meaning of slave culture. In South Carolina, for example, rice cultivation occurred through the task system: Slaves were assigned certain tasks (such as clearing a field or working on an irrigation ditch) that, when completed, allowed bondspersons to engage in other activities such as tending a garden to supplement food rations. In addition, South Carolina masters often lived apart from slaves during the hottest summer months, leaving bondspersons under the eye of white overseers and black slave drivers. Thus, while South Carolina bondage was one of the most brutal slave systems on the North American continent, it also ironically offered the most distance from white authority. African-derived cultural patterns and linguistic systems developed more fully in South Carolina than anywhere else—and some still survive (such as Gullah). Finally, South Carolinians probably learned rice-cultivation techniques from enslaved people forcibly removed from rice-growing regions of Western Africa, such as modern-day Angola. At the beginning of the 18th century, and extending through the early 1800s, South Carolina slaveholders prized African rice cultivators. Their traditions survived the horrors of the Middle Passage and took root in South Carolina.

In the Chesapeake states of Virginia and Maryland, however, the relatively smaller size of plantations dictated a different slave cultural development. Slave owners often lived in closer proximity to bondspersons, and they sought to influence their daily lives to a much greater extent. Evangelical Christianity spread more rapidly among slaves in the Chesapeake during the late 18th and early 19th centuries, because slaves were less isolated from European-American institutions. In addition, Virginia and Maryland slaveholders preferred to import slaves from the Caribbean, not directly from African shores as did South Carolinians. By the revolutionary era, the lagging tobacco fortunes of Virginia and Maryland plantation owners created a surplus of slave labor. Many Chesapeake planters even supported calls

to end the overseas slave trade. On the other hand, South Carolinians brought in 40,000 slaves before a congressional ban of the trade took effect in 1808—ironically rejuvenating the African presence on South Carolina plantations in the early 19th century.

Because of the excess slaves in the Chesapeake region, and because of the expansion of settlement across the Appalachians, between 1783 and 1815 many African-American slaves experienced disruption in their lives as they were either brought to the FRONTIER by their owners or were sold in areas of new settlement. This forced migration is often overlooked in the saga of early westward expansion, which focuses more on the mythical European-American backwoodsman than on the bondsperson brought over the mountains in chains. Slaves on the frontier engaged in a variety of activities, including hunting, herding, and breaking new ground for farming. More often than not, sooner or later, their work settled upon the daily grind of tending a tobacco or cotton crop. In the meantime, these slaves usually experienced permanent separation from family and friends, and a life of isolation compared to the more accustomed African-American communities of the slave quarter in the tidewater regions near the Atlantic.

Ultimately, African traditions survived and even thrived among Chesapeake and frontier slaves, as they did even in northern locations. Still, regional variations proved telling in the formation and development of slave culture in North America.

## slave trade

Although the overseas slave trade in North America accounted for a relatively small percentage of slaves exported from Africa, it became a focal point for ANTI-SLAVERY reformers in the final decades of the 18th century. According to the most recent scholarly estimates, the slave trade forcibly removed from 12 to 15 million Africans between the 16th and 19th centuries—with many Africans being sent to Brazil or to the WEST INDIES. Less than 5 percent of enslaved Africans came to North America. Between 1700 and the 1780s, roughly 250,000 Africans arrived in North America via the slave trade. Routes of the slave trade to North America differed according to the needs and predilections of slave owners. Colonial Virginians imported slaves from the West Indies, preferring that they be “seasoned”—having experience as slaves and having survived the first disease ridden years of SLAVERY (see also DISEASE AND EPIDEMIC). South Carolinians, on the other hand, purchased slaves directly from African shores, favoring ethnic groups who had cultivated rice and could transfer their skills to New World plantations. Northern colonies imported slaves as well, although in fewer numbers. Between 1757 and 1766 Philadelphians brought about 1,300 slaves to the city’s port—much fewer than either Virginians or South Carolinians might import in a given year. But even though northern colonies were not the largest slave importers, northern mer-

chants directed much of the overseas slave trade to North America, particularly following the REVOLUTIONARY WAR (1775–83). During the 1790s, for example, Pennsylvania abolitionists tracked dozens of cases in which New England ships brought slaves to the southern plantations.

The slave trade came under intense public attack during the revolutionary era. The concern for human rights and self-determination that accompanied the AMERICAN REVOLUTION led many ministers, statesmen, and even slaveholders to view the slave trade as a violation of both natural rights and religious dictates. THOMAS JEFFERSON’s initial draft of the DECLARATION OF INDEPENDENCE chastised King GEORGE III for forcing the slave trade upon colonial Americans. Celebrated Philadelphia physician and reformer BENJAMIN RUSH issued one of the most stirring attacks on the trade: a 1773 pamphlet, *An Address to the Inhabitant of the British Settlements in America, upon Slave-Keeping*. New England clergyman ISAAC BACKUS, Virginia politician GEORGE MASON, and President GEORGE WASHINGTON were some of the other figures who similarly came to oppose the slave trade. In fact, although the UNITED STATES CONSTITUTION prohibited a federal ban on imports for 20 years—until 1808—every state legislature outlawed the slave trade in the 1780s and 1790s, although South Carolina rescinded its ban in 1803.

The slave trade became one of the first points of sectional conflict in early congressional politics. In the first Congress in 1790, early abolitionists petitioned the government to curtail African imports before the 1807 date. Proslavery advocates in South Carolina and Georgia threatened disunion if any slave trade ban occurred before the constitutional deadline. Congress backed away from the issue but revisited it briefly in 1794 by passing a law against U.S. ships from visiting foreign ports for the purposes of carrying out the slave trade. By 1807, however, Congress, with little debate, could pass legislation ending the international slave trade on January 1, 1808—“a day of public thanksgiving,” as Philadelphian ABSALOM JONES put it, for free black communities.

### Sons of Liberty

Although the term came to represent almost anyone who opposed imperial regulation in the 1760s, and was extended to those who fought for independence after 1776, originally the Sons of Liberty referred to the committee in each community that organized the opposition to the STAMP ACT (1765). The size and social standing of these committees varied from town to town. Boston's committee, originally called the LOYAL NINE, did not have many members, and most came from the middling ranks of society. New York City had either 10 or 18 members, depending on what list is used, but had more merchants and LAWYERS represented among the number. Charleston, South Carolina, had 26 members, including Christopher Gadsden, a wealthy merchant, and many ARTISANS. Albany had more than 90 Sons of Liberty, while other groups had more than 100.

Whatever their number and social standing, the Sons of Liberty played a central role in the resistance to the Stamp Act by placing themselves between the colonial leadership and the mob in the street. The Sons of Liberty thereby added muscle to nonimportation agreements and declarations in opposition to imperial regulation while striving to restrain crowd behavior. Without rioting to coerce stamp distributors into resigning, to close courts, and to ensure noncompliance with the Stamp Act, all the petitions and pamphlets in the world would have been meaningless. But if the RIOTS went too far, then the political message of the anti-Stamp Act forces would be harmed. The Sons of Liberty engaged in a precarious balancing act by organizing crowd demonstrations, developing contacts with mob leaders, and by interceding at crucial moments to mute the full impact of the mob. They were not always successful; but they managed to control or guide the situation often enough to sustain the opposition to imperial regulation and nullify the effect of the Stamp Act.

The Sons of Liberty was a local association within each community; there was no pan-colonial group called Sons of Liberty. However, as the crisis wore on, different Sons of Liberty began to correspond with each other to coordinate positions, and some groups even sent delegations to visit one another.

Once the Stamp Act was repealed, in some communities the Sons of Liberty disbanded and continued in others. The experience of organizing resistance, contacting other communities, and working with both the mob and colonial leadership had two long lasting results. First, the Sons of Liberty gave additional political voice to men from the middle of society. Second, in reaction to other imperial measures, many of the same men either reasserted the Sons of Liberty, or organized new committees, to coordinate resistance. When rebellion turned to revolution, these committees even began to take over the functions of government.

### South Carolina Regulation (1767–1769)

During the late 1760s the South Carolina Regulation—an elite-led social reform movement employing vigilante methods—erupted on the southern FRONTIER. This movement had its origin in the history of the southern backcountry. The defeat of powerful coastal Indians in the Yamasee War early in the 18th century allowed European-American hunters and Indian traders to move into the South Carolina backcountry. Colonists did not settle the region in large numbers until the 1740s, when they began pouring into the area from colonies to the north. Despite prolonged conflicts with the CHEROKEE that lasted until the mid-1760s, backcountry settlers rapidly developed the region's ECONOMY. Initially most farmers concentrated on feeding their families through hunting and growing a little corn, but many quickly began to take advantage of commercial crops such as grain, COTTON, indigo, and tobacco. The most ambitious individuals invested in enslaved workers to help them expand production. Forced black laborers provided aspiring planters with wealth and status. The problem for these backcountry elites was the absence of government institutions and laws to deal with discontented Indians, rebellious slaves, greedy bandits, and squatters who lived from hunting and gathering. All of these people threatened the sanctity of property and the needs of a commercial economy based on SLAVERY.

While the area expanded economically and the number of colonists grew exponentially, the infrastructure did not keep pace. Government institutions—civil and criminal courts, jails, even a land office—did not exist in the backcountry. The lack of courts and jails made debts difficult to collect and attracted horse thieves and bandits. When planters wanted to collect debts, bring criminals to justice, or patent land, they had to travel to Charleston, which could take two weeks. The South Carolina assembly, overwhelmingly made up of easterners eager to protect their own interests, did little to rectify the situation.

Responding to a wave of crimes in the mid-1760s, property holders, led by slave owners, took the law into their own hands. Outraged over their lack of success in getting bandits and horse thieves convicted in the Charleston court, they began in the fall of 1767 to attack outlaw

communities, burning houses, taking property, and flogging suspects. Adopting the name Regulators, they sent a petition to the governor and assembly calling for the establishment of courts in the backcountry, legal reforms, changes in the poor law, and the creation of new laws to force people without visible means of subsistence, such as hunters, to work. While the assembly set about obtaining the Crown's approval of a circuit court act, it legitimated the vigilante actions of the Regulators by appointing two companies of Rangers, made up largely of Regulators, to suppress outlaw gangs. These Rangers tracked outlaws even in North Carolina, Virginia, and Georgia. They killed large numbers of law breakers; others they took to Charleston to stand trial. By March 1768 the campaign was deemed a success.

But rather than end their activities, Regulators now turned their attention to such marginal people as squatters, vagrants, and hunters, who either could not, or would not, make AGRICULTURE and land ownership their main goals in life. Such people were flogged, expelled from their communities, or forced to work. Women who transgressed traditional sexual norms were whipped or dunked. Emboldened by their successes, the Regulators defied authorities by preventing them from serving all warrants or writs, except writs of debt, in the backcountry. The governor and the assembly, aware of how much they needed the support of Regulators in case of slave uprisings or renewed conflict with NATIVE AMERICANS, did little to suppress the vigilante movement which was soon in complete control of the backcountry. Yet opposition developed among backcountry inhabitants who abhorred the violence and the choice of victims. Their resistance, in some instances itself violent, and the eventual passage of a circuit court act, ended the movement in 1769. In late 1771 the governor issued pardons for Regulators facing damage suits brought by their victims. Unlike the North Carolina Regulators who demanded a more equitable economic system for free farmers, the South Carolina Regulators enabled elite men to consolidate their power and push the backcountry several steps closer to becoming a well-ordered slave society.

### Stamp Act (March 22, 1765)

Along with the SUGAR ACT (1764), the Stamp Act was intended to raise revenue in the colonies explicitly for paying part of “the expenses of defending, protecting, and securing” the colonies from NATIVE AMERICAN and foreign threats. Since Great Britain had accumulated a debt over £135 million the British first minister, GEORGE GRENVILLE, thought it only appropriate that the colonies contribute to their own defense. Maintaining an army in North America would cost about £200,000 per year. The Sugar and Stamp Acts together were to raise about half that sum, with the rest of the money provided by Parliament. The British believed that Stamp duties were an innocuous tax and would be self-enforceable. Great Britain already had a stamp tax, and since the duty would be levied on all legal and commercial papers, liquor licenses, land instruments, indentures, cards, dice, newspapers, pamphlets, advertisements, academic degrees, and appointments to office, colonists could not undertake any business without the stamped paper. Anyone interested in any transaction—whether it was buying a piece of property, sailing a ship, or exchanging goods—would use the stamped paper to ensure the transaction was legal. To make the law more acceptable, the British government chose local politicians within the colonies as stamp agents.

The law, however, was not acceptable to most colonists. The Stamp Act created a crisis in the relationship between Great Britain and the colonies. The opposition took many forms, and established a pattern that would be followed throughout the RESISTANCE MOVEMENT (1764–75). On one level was the reaction of the elite. The Virginia House of Burgesses and eight other colonial houses of assembly passed resolves asserting that only representatives elected by the colonists had the right to tax the colonies. Nine colonies also sent representatives to a STAMP ACT CONGRESS in New York in October 1765 that declared that Parliament had no right to tax the colonies. Men like DANIEL DULANY wrote pamphlets exploring the constitutional issues. Dulany, for instance, denied the idea that colonial Americans were virtually represented in Parliament, and asserted the right of the colonists to be taxed only by their actual representatives that they voted into office. Other colonial Americans struggled to distinguish between internal taxation—to raise revenue within the colonies—and external taxation—to regulate the empire, declaring that Parliament had a right to the second form of taxation, but not the first. In addition, groups of merchants in several seaports passed agreements against importing goods from Great Britain in an effort to put economic pressure on their British counterparts to have the measure repealed.

On another level was the reaction of the people in the street. The Stamp Act led to a wave of rioting that swept through the colonies. Mobs in Boston marched through

An angry mob protests against the Stamp Act by throwing stamped documents onto a bonfire in Boston, August 1765. (Hulton/Archive)

town with an effigy of stamp distributor ANDREW OLIVER and tore down a building he had constructed on the waterfront on August 14, 1765. Twelve days later, another Boston mob gutted the house of Lieutenant Governor THOMAS HUTCHINSON. Similar disturbances occurred in several seaports, forcing stamp distributors to resign and making the law a dead letter. The mob seemed to rule the streets in community after community. The Stamp Act was to take effect on November 1, 1765. That day came and went with, after some coercion by the people in the streets, business continuing as usual. Crowds also added muscle to the non-importation agreements by coercing those who imported goods from Great Britain. The mob made a self-enforceable law, unenforceable.

Local leaders formed a series of loose associations to coordinate the crowd action and the resolves of the elite. In Boston the group at first called itself the LOYAL NINE, but they later took the name that was used elsewhere—SONS OF LIBERTY. These groups strove to guide the mob,

correspond between towns and colonies to coordinate their positions, and sought to enforce resolves against the use of stamped paper. In most colonies it was the Sons of Liberty, with mobs close by, that saw to it that ships sailed without stamped paper and that all judicial proceedings were stopped. They even sought to put additional pressures on merchants who did not comply with non-importation agreements.

All of these measures had some impact on Great Britain. British merchants, unable to collect debts in closed colonial courts and suffering a decline in TRADE, petitioned Parliament to repeal the law. Oddly, what made the most difference in Parliament was neither the colonial opposition nor the merchant's petitions. Instead, the crucial factor in the repeal of the Stamp Act was the fact that there was a change in government. Grenville, who was never popular with King GEORGE III, was forced from office in the summer of 1765 over issues unrelated to colonial policy. In Grenville's place the king appointed a new administration headed by Charles, Lord Rockingham who had opposed the Stamp Act in the first place. Given the colonial resistance, and the pressure of British merchants, Rockingham had the act repealed (March 18, 1766). However, to placate his political opposition, and so as not give in on the constitutional issues, he also had Parliament pass the DECLARATORY ACT (1766), which stated that Parliament had the right to legislate for the colonies in all cases whatsoever.

Morgan and Helen M. Morgan, *The Stamp Act Crisis: Prologue to Revolution* (Chapel Hill: University of North Carolina Press, 1953).

### Stamp Act Congress (October 1765)

In reaction to the STAMP ACT (1765), the Massachusetts assembly circulated a letter to the other colonies in North America to meet in a congress in New York City to discuss how they should oppose the tax measure. Nine colonies responded to the invitation. Virginia, North Carolina, and Georgia could not send delegates because their governors refused to call the assemblies to choose delegates. New Hampshire did not send a delegate but approved the proceedings.

Twenty-seven delegates attended the meeting, and although they chose conservative Timothy Ruggles to preside over the congress, they drew up a strongly worded petition against the Stamp Act. Like most petitions of the

18th century, the congress began with a statement of loyalty to king, proclaiming that they were “sincerely devoted” and had “the warmest Sentiments of Affection and Duty to His Majesty’s Person and Government.” However, they also asserted “that his Majesty’s Subjects in these Colonies, are entitled to all the inherent Rights and Liberties of his Natural born Subjects, within the Kingdom of *Great Britain*” and “that it is inseparably essential to the Freedom of a People, and the undoubted Right of *Englishmen*, that no Taxes be imposed on them, but with their own Consent, given personally, or by their Representatives.” Besides protesting the Stamp Act, the delegates also officially objected to the SUGAR ACT (1764).

The delegates believed that Parliament had the right to pass laws regulating the empire but held that Parliament did not have the right to raise taxes within the colonies. They hotly debated including an explicit statement admitting Parliament’s role in legislating external affairs in their petition but decided not to do so. The congress also did not advocate any overt resistance to the law. While neither too radical nor too conservative, the Stamp Act Congress represented an important early effort at intercolonial cooperation

### states' rights

The issue of states’ rights—the idea that a state had the right to resist federal intrusion on its laws—arose almost as soon as the United States first became a nation. American WHIGS fought the REVOLUTIONARY WAR (1775–83) in part as a means to guarantee that a central government, in this case Parliament, should not dictate taxes to each colony. When the revolutionaries established their first form of government under the ARTICLES OF CONFEDERATION, they asserted that “each state retains its sovereignty, freedom and independence,” and that all powers not expressly granted in the Articles of Confederation were left to the states. Taxes were to be levied in proportion to the population of each state and raised by each state on its own.

The members of the Philadelphia CONSTITUTIONAL CONVENTION found these restrictions too limiting, and therefore they created a more powerful government, dependent on simple majorities (or two-thirds majority to override a presidential veto) and capable of raising and collecting its own taxes. The founding fathers also inserted a loophole into the UNITED STATES CONSTITUTION: Article 1, Section 8 included a statement that Congress had the power “to make all Laws which shall be necessary and

proper for carrying into Execution the foregoing powers, and all other Powers vested by this Constitution in the Government of the United States. . . .”

ANTI-FEDERALISTS had many objections to the Constitution, including the belief that the new government destroyed the rights of individual states. As a result of anti-Federalist complaints, supporters of the Constitution agreed to pass the BILL OF RIGHTS. The last and 10th of this list of rights, and amended unto the Constitution, stated: “The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States, or to the people.” Between this article and the “necessary and proper clause” there was a great deal of room for debate over the relative power of the federal and state governments.

That debate was joined as the first party system emerged in the 1790s. ALEXANDER HAMILTON and the FEDERALIST PARTY used the “necessary and proper” clause to expand the powers of government and create institutions like the FIRST BANK OF THE UNITED STATES. The DEMOCRATIC-REPUBLICAN PARTY opposition, led by THOMAS JEFFERSON and JAMES MADISON, held that this interpretation of the Constitution was too broad and drained power from the states. While each side jockeyed for position during the mid-1790s, it was only when the Federalist Party government passed the ALIEN AND SEDITION ACTS (1798) that Jefferson and Madison fully articulated a states’ rights argument. Writing the VIRGINIA AND KENTUCKY RESOLUTIONS (1798), Madison and Jefferson asserted that “whensoever the general government assumes undelegated powers, its acts are unauthoritative, void, and of no force.” While staking out an extreme state’s rights position, the Virginia and Kentucky Resolutions did not have a big impact on the rest of the nation. The ELECTION OF 1800 and Jefferson’s victory left the repressive measures of the Alien and Sedition Acts moot.

As the Democratic-Republicans gained power in the early 1800s, the Federalist Party had to turn to states’ rights arguments. Some members of the Federalist Party opposed the LOUISIANA PURCHASE because they believed there was no constitutional provision to permit the acquisition of territory and because any new states that might result would weaken the political voice of the existing states. Similarly, Federalists Party leaders argued against the EMBARGO OF 1807 and provisions to support the trade ban because it hurt the interests of the New England states, the stronghold of the Federalist Party. The most extreme statement of states’ rights by the Federalist Party occurred in opposition to the War of 1812 (1812–15). The resolutions passed at the Hartford Convention asked the New England state legislators to protect their citizens from forcible enlistment into the militia, army, or navy—in effect nullifying the war effort. With the war over even before the Hartford Convention

adjourned, the resolutions had little real impact beyond further discrediting the Federalist Party.

In the years after 1815, states' rights would emerge repeatedly as a divisive issue concerning internal improvements, TARIFFS, BANKS, and SLAVERY. Ultimately, the issue would contribute to the origins of the Civil War.

**Steuben, Frederick, baron von** (1730–1794) *military trainer of the Continental army*

A relatively obscure foreign officer who arrived at VALLEY FORGE in the bleak winter of 1777–78, Baron Frederick von Steuben became a crucial element in the CONTINENTAL ARMY's development and success as a fighting unit. Born into a Prussian military family in 1730, Steuben entered the officer corps of the Prussian army while still in his teens. He attained the rank of captain while serving in the Seven Years' War—in North America the conflict

Baron von Steuben (National Archives)

was called the French and Indian War (1754–63)—and was attached for a time to the general staff of Frederick the Great, Europe's foremost military genius. When peace came in 1763, Steuben left the army. For the next 12 years, he was court chamberlain to the prince of Hohenzollern-Hechingen, during which time he supposedly acquired the title of baron. Heavily in debt when he left that situation in 1775, he sought various military and civilian posts in Europe. Finally, in 1777, he came to BENJAMIN FRANKLIN's attention in Paris. After securing an endorsement and a loan, Steuben was soon on his way to North America.

Upon his arrival, Steuben wrote to the SECOND CONTINENTAL CONGRESS and offered his services to the fledgling nation, asking only payment of his expenses. Satisfied that this military expert was flexible enough to adapt his training methods to the raw Continental troops, GEORGE WASHINGTON welcomed Steuben into the fold. The baron's robust personality and military expertise had an energizing effect on the ragtag volunteer army he found wintering at Valley Forge. Unable to speak English, Steuben worked through interpreters as he undertook to transform the demoralized, disorganized men into confident, efficient soldiers. He began by composing a uniform code of drill, writing his instructions in French, which were then translated into English. The drill regulations were transcribed daily and passed along to all levels of command, so that eventually every officer and drill instructor could make his own copy. Steuben formed a model company of 100 specially chosen men; wishing to train them personally for maximum effect, he learned the English words for his instructions and delivered them by rote. The men from the model company would then become drill sergeants for their own units. As the soldiers became more proficient under Steuben's demanding yet good-humored tutelage, enthusiasm for precision drilling spread throughout the army and morale increased. Washington recognized Steuben's remarkable achievement by recommending him for the post of inspector general with the rank of major general. When the Continental army marched out of Valley Forge in June 1778, it had attained a level of discipline almost comparable to that of the professional British regulars. Steuben's drill manual grew into the *Regulations for the Order and Discipline of the Troops of the United States*, which remained the official guide for military training and procedure until 1812.

In 1780 Washington granted Steuben's wish for a field command, and he served as a division commander during the siege at YORKTOWN (October 19, 1781). After the Revolutionary War, Steuben became a citizen of the United States and resided in upstate New York. Rising debts almost forced him into bankruptcy in 1790, but the federal government awarded him an annual pension of \$2,500 for his wartime services. Baron Steuben died on November 28, 1794.

### **Stoney Point, Battle of** (July 16, 1779)

General ANTHONY WAYNE led a successful assault on the British position at Stoney Point on the west bank of the Hudson River at King's Ferry on July 16, 1779. Defended by 500 British soldiers under the command of Colonel Henry Johnson, Stoney Point looked impregnable since it sat on a peninsula and was atop a steep hill 150 feet above the river. Moreover, the landward approach was through a swamp. Wayne planned a midnight assault and divided his light infantry corps into three columns. A small contingent would feign an attack from the landward side, firing their weapons and making as much noise as they could. The other two columns would advance in total silence and scale the heights along the river with unloaded muskets and fixed bayonets. The attack on the two wings was preceded by small detachments to clear the abatis and other obstructions. The plan worked to perfection, and the men climbing both sides of the hill arrived almost simultaneously and overwhelmed the British garrison. After a brief but furious fight, Johnson surrendered. Of the 1,300 men in Wayne's force, 15 were killed and 85 wounded. The British lost 20 killed and 442 captured (including 74 wounded). The victory was an important boost to the morale of the CONTINENTAL ARMY, although three days after the battle, GEORGE WASHINGTON ordered Stoney Point abandoned since he did not want to detach too many troops to defend a position that was vulnerable to British army and naval attack.

### **Story, Joseph** (1779–1845) *associate justice of the Supreme Court*

Joseph Story was the leading academic on the early SUPREME COURT of the United States. Born in Massachusetts on September 18, 1779, and educated at Harvard, Story studied law in the office of Samuel Sewall, later chief justice of the Supreme Court of Massachusetts. In 1801 he began practicing law and was soon elected to the Massachusetts legislature. An avowed DEMOCRATIC-REPUBLICAN (Jeffersonian), in 1808–09 he represented Massachusetts in

the U.S. House of Representatives, where he opposed the EMBARGO OF 1807 and earned the distrust of many leading Democratic-Republicans, including Jefferson himself. He then returned to Massachusetts, where he served again in the legislature.

On November 18, 1811, President JAMES MADISON appointed Story an associate justice of the Supreme Court of the United States. At age 32, he was the youngest person ever appointed to the Supreme Court. He remained on the Court for 34 years. As a justice, Story quickly allied himself with chief justice JOHN MARSHALL. Perhaps the most important majority opinion he wrote was in *Martin v. Hunter's Lessee* (1816) upholding the Supreme Court's jurisdiction over the state courts. Story also wrote the Court's opinion in the case of the *Amistad*, directing that the alleged slaves who seized that vessel be freed and returned to their homes in Africa. In 1835, when John Marshall died, Story was widely thought to be the most capable successor as Chief Justice, but President Andrew Jackson opted not to make the appointment, largely because he considered Story dangerous to the cause of STATES' RIGHTS.

Story was extraordinarily productive. His position as Supreme Court justice allowed him some free time, and in 1829 he decided to teach at Harvard Law School. Between 1832 and 1845, he published a series of commentaries covering such diverse subjects as the Constitution, equity jurisprudence and pleading, and bailments. These gained Story an international reputation and a fairly large income. He died on September 10, 1845.

### **Stuart, Gilbert** (1755–1829) *painter*

Gilbert Stuart, a provincial artist in the 1770s, became the leading portraitist in the new nation, especially renowned for his paintings of the revolutionary hero and president, GEORGE WASHINGTON. Stuart's father operated a snuff mill in North Kingston, Rhode Island, where he was born in 1755. The family moved to Newport when he was a young boy where he met the traveling artist Cosmo Alexander, who provided the young Stuart with lessons and employment as his assistant on his travels to Pennsylvania, Virginia, and Scotland where Alexander's unexpected death in 1772 left Stuart stranded. Stuart made his way back to Newport and continued his portrait work. When his LOYALIST father moved to Nova Scotia in 1775 to avoid the revolutionary crisis, the young patriot artist departed for

London where he struggled for work, although BENJAMIN WEST helped him with lessons and employment. His *Self Portrait* of 1778 shows his increasing knowledge of English and European styles and models. He began to achieve success and commissions from prominent people but was forced to flee London in 1787 to escape his creditors.

Stuart arrived in New York in 1793 to seek the patronage of the new nation's merchants, politicians, and REVOLUTIONARY WAR (1775–83) heroes. Armed with a letter from Chief Justice JOHN JAY, he secured a sitting of President GEORGE WASHINGTON in Philadelphia in 1795, the first of several Stuart paintings of Washington. MARTHA WASHINGTON commissioned another likeness, the *George Washington Athenaeum Portrait*, (1796, National Portrait Gallery). He worked in Philadelphia for nine years before moving briefly to the new capital, WASHINGTON, D.C., in 1803, then leaving for Boston in 1805, where he remained for the rest of his life.

Stuart's cosmopolitan painterly technique featured rapid and facile brushwork along with subtle blending of color to create an atmospheric style. However, the artist had difficulty finishing his sittings and often was perilously in debt. He died insolvent in Boston in 1828.

**Stuart, John** See BUTE, JOHN STUART, EARL OF.

### Suffolk Resolves (September 9, 1774)

In an effort to provide a course of action to resist further imperial regulation, SAMUEL ADAMS had the county convention in Suffolk, Massachusetts, draw up a series of resolves opposing the changes in Massachusetts government dictated by the COERCIVE ACTS (1774). Written by JOSEPH WARREN, the resolves were delivered to the FIRST CONTINENTAL CONGRESS by PAUL REVERE on September 16, 1774. As its first official action, Congress endorsed the Suffolk Resolves, thus assuming a supervisory role over the resistance to the Coercive Acts in Massachusetts.

The resolves began with a fiery preamble that referred to FREDERICK, LORD NORTH as having “the arbitrary will of a licentious minister,” and decried the British soldiers in Boston as “military executioners.” The Coercive Acts were labeled “murderous.” The resolves also outlined a series of measures intended to circumvent or nullify the British legislation. Tax collectors were not to send their receipts

to the treasury. The colony's councillors, now appointed by the governor instead of elected, were urged to resign. Everyone was to ignore the action of judges appointed with new commissions, and all judicial orders were not to be followed. The Suffolk Resolves also called for a nonimportation movement. As radical as these steps appeared, many in Congress saw them as following a moderate course. All measures were viewed as defensive, and the resolves reasserted the colonial “affection for his majesty.” There was no call to drive the British troops out of Boston, and there was no unilateral assumption of the previous colonial government. The Suffolk Resolves were an important first step in Congress's emergence as a guiding force in the crisis caused by the Coercive Acts, and they helped to prepare the way for the ASSOCIATION that led to a nonimportation movement that further aggravated the imperial crisis.

### suffrage

Revolutionary Americans took the broad right to vote that had existed during the colonial period and expanded it after independence. In England the franchise was based on property. The standard requirement was a 40-shilling freehold, which meant the right to vote was given to adult males who owned property that was worth 40 shillings annually in income or rent. In the 18th century this limited who voted in England to about one-fifth of the adult male population. Property qualifications in colonial North America had a less restrictive effect because property ownership was much more widespread. Some colonies, such as Massachusetts and Rhode Island, simply adopted the 40-shilling freehold. In other colonies, such as Virginia and North Carolina, the right to vote was restricted to those who owned a certain amount of acreage. Taken as a whole, more than 50 percent of the adult white males in the colonies had the right to vote.

The RESISTANCE MOVEMENT (1764–75) and the REVOLUTIONARY WAR (1775–83) compelled revolutionary Americans to rethink suffrage. Because the relationship between taxation and representation became such a big issue, and because large numbers of men were called upon to fight the war for independence, there was a clamor for including more people in the political process. The writing of new state constitutions (see also CONSTITUTIONS, STATE) provided the opportunity to do so. Only Vermont in 1777, which was not yet recognized as a legitimate entity by the other states, provided for universal manhood suffrage. Other states came close. Pennsylvania granted the right to vote to all adult male taxpayers and their adult sons.

New York and Maryland reduced the property qualification by about half. New York even allowed tenants to vote if they rented sufficient property and paid taxes. Several states detached voting requirements from owning property to paying taxes, a move that generally increased those eligible to vote and altered the rationale behind the franchise. Traditionally, WHIG theory held that a voter should own a permanent stake in society—property—to ensure his independent judgement. Now, just the fact that a person was taxed meant that he should have some say in government. The new requirements became so inclusive that in some states free AFRICAN AMERICANS, if they met the other requirements, were allowed to vote, and, until 1807, propertied women could vote in New Jersey.

Not everyone was pleased with these developments. Men such as JOHN ADAMS wanted property to be more broadly distributed but still clung to the stake in society ideal. Adams wished that more people owned land so that they could “take Care of Liberty, Virtue, and Interest of the Multitude in all Acts of Government.” But he also held that giving propertyless men the right to vote would corrupt the republic. “Such is the Frailty of the human Heart,” Adams wrote “that very few Men, who have no Property, have any Judgement of their own.” Instead of being independent, the propertyless will be “directed by Some Man of property, who has attached their Minds to his Interest.”

Adams, however, never understood the full force of the democratic movement. Over the course of the next few decades, state after state abandoned property qualifications for voting. Leading the way were the new states admitted into the union. Vermont, when it finally became a state in 1791, and Kentucky, in 1792, both wrote universal manhood suffrage into their constitutions. Most other new states did the same. By the early 1800s the more established eastern states followed suit. Often, however, this expansion of the franchise came with some cost. When New York State removed its property qualifications for adult white men in 1821, it retained them for African Americans. By 1824 every state but Louisiana, Virginia, and Rhode Island had universal white manhood suffrage.

Pole, *Political Representation in England and the Origins of the American Republic* (New York: St. Martin's Press, 1966).

### Sugar Act (1764)

Confronted with the need to raise revenue to help support an army to defend the colonies, the British govern-

ment under the leadership of GEORGE GRENVILLE passed the American Duties Act—generally known as the Sugar Act (passed April 5, 1764)—to generate revenue and make customs collection more efficient. The law is known as the Sugar Act since most colonists focused on its impact on sugar imports. From the British perspective, this measure was logical. Under the previous legislation, the Molasses Act of 1733, colonists were to pay six pence per gallon on foreign molasses. This duty was prohibitive and was intended to help British WEST INDIES planters, since British officials assumed that if the colonists could not afford to buy the foreign product, they would be compelled to buy molasses produced in the British West Indies. However, under the old law smuggling had become so profitable that little molasses was imported from the British islands. The new law therefore reduced the price of imported molasses and represented a net gain in customs collections, since the new rate made legally imported molasses competitive with smuggled molasses.

To help enforce this measure, the Grenville government, which had already begun to tighten up customs enforcement, added provisions to further assist the customs service. In particular, the Sugar Act allowed customs agents to take their court cases to an Admiralty Court away from the immediate neighborhood of the customs violation. Prior to this provision, it was very difficult for a customs officer to gain a conviction when a merchant violated the law because the trial would be held before a local jury that would side with the merchant. The new VICE ADMIRALTY COURT, to be located in Halifax, Nova Scotia, would not have a jury and not be under local influence. In addition, the law limited fines and costs levied against customs collectors for false arrest and gave the Crown, rather than the defendant, the option of what court would hear the case. The British also added provisions that would keep better track of cargoes on intercolonial trade and compel ship owners to post bond to guarantee compliance with the customs laws.

The American Duties Act also affected other trade goods in the colonies. It added some items to the list of enumerated goods—items that could be exported only to Great Britain. The new enumerated goods included hides, whale fins, and iron. The measure also made it more difficult to import textiles such as silk, linens, and calicoes directly to the colonies from foreign ports. It taxed Madeira wine imported directly from Portuguese possessions more heavily than the wine shipped through England. Finally, the new law prohibited the importation of any rum from the French West Indies. This last measure, the British hoped, would force French West Indies planters to export their sugar and molasses to the British North American colonies, where distilleries would make the rum, thereby helping the colonial ECONOMY and forcing France to, in effect, subsidize British colonial production.

Many colonists objected to this law. Merchants had long-established procedures to sidestep imperial measures and had developed smuggling to an art form. Thus, even during the French and Indian War (1754–63) they had illegally imported molasses from the French and other foreign West Indies colonies. The Sugar Act threatened to disrupt their business and hurt their profits. Moreover, the measure was passed at a time when the colonies were struggling economically in a postwar recession. Merchants in several colonies therefore organized to express their discontent with the law. For the most part, they concentrated on economic arguments, saying that the act would hurt their ability to pay their debts to British merchants. In a few instances, the merchants also addressed the ideological issues, expressing concern over being taxed without being represented and declaring their disapproval of the arbitrary nature of the new customs laws. These protests had limited impact on either the colonies or Great Britain. The Sugar Act remained in force and, in fact, to make it even more acceptable the British government, in 1766 reduced the duty to one pence per gallon. It would take other imperial regulations, especially the STAMP ACT (1765), to galvanize colonial resistance further.

Morgan, *The Stamp Act Crisis: Prologue to Revolution* (Chapel Hill: University of North Carolina Press, 1953).

**Sullivan, John** (1740–1795) *Continental army officer*  
John Sullivan was a capable but controversial general in the REVOLUTIONARY WAR (1775–83). A lawyer and major in the New Hampshire militia, Sullivan was a delegate to the FIRST CONTINENTAL CONGRESS in 1774. In 1775 he became a member of the SECOND CONTINENTAL CONGRESS, which appointed him a brigadier general. He helped General GEORGE WASHINGTON's troops lay siege to Boston until the British evacuated the city (March 17, 1776).

After promotion to major-general in 1776, Sullivan was captured by the British in the BATTLE OF LONG ISLAND (August 27–30, 1776). As a sign of goodwill for peace negotiations the British admiral LORD RICHARD HOWE exchanged Sullivan for the British general Richard Prescott. Sullivan immediately rejoined the CONTINENTAL ARMY, participating in the retreat in New Jersey, commanding the right flank in the Battle of Trenton on December 26, 1776, and fighting the British at Princeton January 3, 1777 (see also BATTLES OF TRENTON AND PRINCETON).

Sullivan's failed raid on Staten Island (August 22, 1777) and growing criticism of his conduct at the BATTLE OF BRANDYWINE (September 11, 1777) caused members of Congress to question his competence and propose suspending Sullivan from active duty. Washington, however, supported Sullivan and further investigations cleared his name from any wrong doings. Sullivan hurriedly rejoined Washington to fight in the BATTLE OF GERMANTOWN (October 4, 1777). Although the British repulsed the attack, Sullivan achieved his assigned task, restoring his reputation.

Sullivan spent the winter with Washington in VALLEY FORGE (1777–78) and took command of the troops in Rhode Island in the spring of 1778 in an attempt to drive the British from Newport. The siege of the coastal town depended on the close operation with the French fleet under CHARLES-HENRI-VICTOR-THÉODAT, COMTE D'ESTAING. D'Estaing, however, withdrew after a hurricane scattered his ships. The British counterattacked at the BATTLE OF RHODE ISLAND (August 29, 1778). Sullivan's troops retreated in good order, preventing many casualties and loss of supplies. However, Sullivan openly criticized d'Estaing and the French for the failure to fully support his attack on Rhode Island.

In 1779 Congress ordered Sullivan to wage a scorched earth campaign against the IROQUOIS in New York. Under Sullivan, joined by General GEORGE CLINTON, the revolutionaries burned 18 Iroquois towns, destroyed 160,000 bushels of corn, and laid waste to the Indians' fruit and vegetable gardens, depriving the Iroquois of their economic resources. Feeling ill from his campaign in the wilderness, and still harassed by critics, Sullivan resigned in November 1779.

Sullivan continued his political career as a member of the Continental Congress for two more years. In 1782, he became a member of the New Hampshire constitutional convention and served until 1786 as attorney-general and as speaker of the state assembly (in 1785). In 1786 he was elected president (governor) of New Hampshire and was reelected two more times and ended his political career as a U.S. district judge, a position he held until his death in 1795.

## Supreme Court

The Supreme Court of the United States was established by Article III of the UNITED STATES CONSTITUTION. Article III contains far less detail than Article I (establishing the Congress) and Article II (establishing the Executive), and

much of the operation of the judiciary was worked out over ensuing decades by the Supreme Court itself and by Congress. Article III contains three sections. Section 1 vests the “judicial power of the United States” in “one supreme Court, and in such inferior Courts as Congress may from time to time establish.” The Supreme Court was thus created directly by the Constitution; all lower federal courts were created by Congress. Section 1 also provides that the justices (and all other federal judges) “shall hold their Offices during good Behaviour,” which means they are not subject to removal from office except by IMPEACHMENT. Section 2 lists those cases in which the Supreme Court has appellate jurisdiction and those in which it has original jurisdiction—where it can act as a trial court. Section 3 deals with the crime of treason. Nothing in Article III gave the Supreme Court the power to say what the Constitution meant and to invalidate the acts of the other branches (or the states) if it found them unconstitutional. Power over state legislation was given the Supreme Court by Congress in the JUDICIARY ACT OF 1789. Power over federal acts was claimed by the Court in *MARBURY V. MADISON* (1803). The march to claim and keep this power, which is called the power of judicial review, defines the history of the Court during the early republican period.

Dispute persists over whether the framers intended the Court to exercise the power of judicial review. ALEXANDER HAMILTON, in the *FEDERALIST PAPERS*, urged that while the federal courts would be “beyond comparison the weakest of the three departments of power,” it would “belong” to the federal courts to “ascertain” the meaning of the Constitution “as well as the meaning of any particular act proceeding from the legislative body.” As history has demonstrated, it is hard to reconcile these two statements.

Whatever the case, the first two Supreme Courts declined to assert the power to invalidate legislation. GEORGE WASHINGTON named as the first chief justice JOHN JAY of New York, who had coauthored the *Federalist Papers*. Joining him as associate justices were John Rutledge of South Carolina, John Blair of Virginia, JAMES WILSON of Pennsylvania, William Cushing of Massachusetts, and James Iredell of North Carolina. The Supreme Court met for the first time in the then capital New York on February 1, 1790. Three years passed before the Supreme Court heard a case of consequence. Finally, in 1793 *Chisholm v. Georgia* arrived on the docket. Alexander Chisholm was a South Carolinian who had brought a federal lawsuit against Georgia for failing to pay him under a state bond. Georgia claimed that as a sovereign state it could not be sued in federal court. The Supreme Court held otherwise. The states and Congress balked at the decision, and within five years the ELEVENTH AMENDMENT to the Constitution was ratified overturning the decision. In 1794 Chief Justice John

Jay accepted an appointment as special ambassador to England, where he negotiated what came to be known as JAY’S TREATY (1794). On his return to the United States in 1795, he resigned from the Supreme Court to become governor of New York. Washington appointed as his successor Oliver Ellsworth of Connecticut, principal author of the Judiciary Act of 1789, which established the lower federal courts. Other justices also joined the Supreme Court. Justice Rutledge had resigned in 1791, and he was replaced by Thomas Johnson of Maryland. Johnson resigned a year later, and he was replaced by William Paterson of New Jersey. Justice Blair resigned in 1796, and his place was filled by SAMUEL CHASE of Maryland, who would later be impeached. Justice James Wilson, a notorious speculator, died in 1798 in North Carolina, to which he had fled from New Jersey creditors. Justice James Iredell died in 1799. President JOHN ADAMS named successors to the latter two. To replace Wilson, Adams nominated Bushrod Washington, the nephew and heir of President George Washington. Adams named Alfred Moore of North Carolina to Iredell’s seat.

In 1800 the capital moved from Philadelphia to WASHINGTON, D.C., and the FEDERALIST PARTY lost the presidency. Immediately before Adams turned power over to the incoming Jefferson administration, Chief Justice Oliver Ellsworth tendered his resignation, and Adams hurriedly appointed his secretary of state, JOHN MARSHALL, to fill his place. Marshall’s appointment was the single most important event in the history of the Supreme Court.

John Marshall revolutionized the Supreme Court. During the course of his 34-year tenure as chief justice, he abolished (for the most part) the justices’ practice of writing separate (*seriatim*) opinions, forged the members of the Supreme Court into a unified whole under his command, and established the power of judicial review, thereby fixing the Supreme Court as the central player in the definition of constitutional rights and responsibilities. His tenure began with the landmark case of *Marbury v. Madison*, in which for the first time the Supreme Court invalidated a federal act as unconstitutional. There followed a series of decisions, including *Fletcher v. Peck* (1810), *McCulloch v. Maryland* (1819), and *Trustees of Dartmouth College v. Woodward* (1819), in which the Supreme Court invalidated as unconstitutional acts of various states. The centralizing tendency of his constitutional opinions was controversial, and Marshall won many enemies, particularly in the South. Nevertheless, his legacy persists.

The political and constitutional impact of the Marshall Court years is well known. Less well known is the structure of the institution over which he presided. The Supreme Court itself, as noted, was established directly by the Constitution. The lower federal courts—the federal district and circuit courts—were established by the Judiciary Act of 1789, then briefly reformed by the JUDICIARY ACT OF 1801,

then reestablished along the lines set forth in the Judiciary Act of 1789 when the 1801 Judiciary Act was repealed in 1802. From the justices' vantage, the worst part of the structure established by the 1789 act was the circuit court. The circuit courts acted both as appellate courts over the district courts and as trial courts. The circuit courts comprised the district judge for the district in which the court sat and the Supreme Court justice(s) assigned to that circuit. For most of the working year, the justices were not hearing cases in the capital; instead, they were riding around the country presiding over appeals from district court decisions and trials. The circuit responsibility was removed temporarily by the Judiciary Act of 1801 and then reinstated when that act was repealed the following year. Circuit riding continued to occupy the major part of the justices' time during most of the 19th century.

Where did the Supreme Court meet? Perhaps surprisingly, the Supreme Court lacked its own building until the 1930s. During its first two decades, when the capital was in New York, Philadelphia, and then Washington, D.C., the Supreme Court met in a variety of places, from state courtrooms to congressional committee rooms. In 1810 the justices were finally given a courtroom of their own in the basement of the United States Capitol. It was here that most of the major landmark cases of the Marshall Court were heard and decided, and here that our modern constitutional order was largely fashioned.

**Talleyrand-Périgord, Charles-Maurice de, prince de Bénévent** (1754–1838) *politician, diplomat*

The nimble politician and diplomat, Charles-Maurice de Talleyrand-Périgord, prince de Bénévent (usually called Prince Talleyrand), served in seven different governments in France. He is most noted for his role in the Congress of Vienna, where he managed to ensure that France, even though defeated, would still be considered a power in Europe. As French foreign minister in the late 1790s and early 1800s, he was involved in the XYZ AFFAIR (1797–98) and the LOUISIANA PURCHASE (1803).

The second son of a minor French noble family, Talleyrand was trained as a priest. By the beginning of the FRENCH REVOLUTION (1789–99), he was a bishop. Supporting moderate reform, he advocated the surrender of all church lands to the French state and government support for the clergy. His position on the church led to his excommunication. During the most radical phase of the French Revolution he was sent to England on a diplomatic mission. Rather than return to France, where he might have been guillotined, he went to the United States. In 1796, after a more conservative regime had seized power in France, he went back to his native country and was appointed foreign minister. It was from this position that he had his agents, labeled X, Y, and Z, demand bribes from U.S. negotiators. This mistake led to the QUASI-WAR (1798–1800) between France and the United States. But it was also Talleyrand, after NAPOLEON BONAPARTE had seized power, who orchestrated the negotiations that ended the undeclared war. Similarly, Talleyrand played a key role in the discussions leading up to the purchase of Louisiana by the administration of THOMAS JEFFERSON, insisting that if France gave up New Orleans, it would have little use for the entire territory. Although he was made a prince by Napoleon, he disagreed with the emperor's ambition to dominate Europe and retired in 1807. He came out of retirement for the Congress of Vienna, representing the Bourbon kings of France. He retired again in 1815. He subsequently served

the July Monarchy, established in 1830, as ambassador to Great Britain.

**Tammany Society**

The Tammany Society, or Columbian Order, was founded in 1786 in New York City as a fraternal organization. Centering on the figure of the legendary Delaware chief Tamanend, members developed a ritual based on NATIVE AMERICAN symbols: The leaders were sachems, the members braves; Tammanyites wore Native costume at celebrations; and they called their meeting place a wigwam. Although the Tammany Society had some more affluent members, it attracted a disproportionate number of ARTISANS. Initially, its aim was “to cherish . . . the great principles of civil liberty . . . to cultivate political information . . . to give exercise to the divine emotions of charity—and finally . . . to enjoy without restraint the generous effusions of national enthusiasm.” Given its membership, the Tammany Society quickly took on an egalitarian and democratic caste.

In the early 1790s Tammany centered its activities on celebrating various patriotic holidays, but the controversies of 1793 and 1794 brought it into politics, supporting the DEMOCRATIC-REPUBLICANS and THOMAS JEFFERSON. With almost 500 members, Tammany helped to garner artisan support for Jefferson in the ELECTION OF 1800. By that time, Tammany was a political bastion of AARON BURR. After Burr's fall from grace, Tammany continued to be important in Democratic-Republican politics. Representing worker interests, Tammany supported a number of democratic causes, including ending imprisonment for debt and universal manhood SUFFRAGE. Tammany became part of the political organization of Martin Van Buren and the Democratic Party. By the 1830s Tammany had become a political machine that many viewed as the epitome of corrupt urban politics.

## tariffs

Taxes on imported goods are called tariffs. Such taxes have been important in the political controversies in the history of the United States, from colonial complaints over imperial policy to debates over the use of tariffs to raise revenue and protect industry.

Although imperial TRADE regulations passed by Parliament are not often considered tariffs, these measures often functioned just like the tariffs of the national period. Laws such as the Molasses Act (1733) that taxed imported sugar, were meant to encourage agricultural production in the British WEST INDIES at the expense of France and other foreign powers. Both the SUGAR ACT (1764), which decreased the tax on sugar but provided for better enforcement, and the TOWNSHEND DUTIES (1767) were taxes on imports intended to raise revenue. While such measures led to the RESISTANCE MOVEMENT (1764–75) and contributed to the outbreak of the REVOLUTIONARY WAR (1775–83), the United States had to rely on customs duties once

it achieved independence. The SECOND CONTINENTAL CONGRESS failed to successfully impose such regulations, while several states, such as Massachusetts and Pennsylvania, collected tariffs in the 1780s to protect production of manufactured items and raise revenue.

Almost as soon as the new Congress under the UNITED STATES CONSTITUTION met, it passed a tariff. The Tariff Act of 1789 placed a 5 percent impost on all imported items but added extra duties to other items. Carriages, for example, carried a 15 percent duty. JAMES MADISON and THOMAS JEFFERSON wanted to pass additional imposts against British imports to compel the British to sign a commercial treaty and open the WEST INDIES to trade from the United States. ALEXANDER HAMILTON and the FEDERALIST PARTY opposed this policy of discrimination since it would severely cut revenue and thereby damage the credit of the United States. Although successful in preventing discrimination against Great Britain, Hamilton failed in another part of his program—the desire to use increased imposts to protect manufacturers. The only legislative encouragement for industry before the War of 1812 (1812–15) was incidental and came from measures such as the EMBARGO OF 1807. The decline of trade that occurred after 1808 through the War of 1812 helped to spur industry in the United States. Recognizing this growth as a positive development, DEMOCRATIC-REPUBLICANS passed a protective tariff in 1816. Importers of items such as COTTON and woolen goods had to pay a 25 percent tax until 1819. In 1818 the tariff deadline was extended to 1826. By that time, tariffs had become a central political issue, separating the developing POLITICAL PARTIES and dividing the nation into sections.

## Tarleton, Banastre (1754–1833) soldier

A brilliant cavalry officer, renowned for his tactics of relentless pursuit, sudden appearance, and swift assault with sabers and bayonets, Banastre Tarleton became one of the most hated men of the REVOLUTIONARY WAR (1775–83). Born in Liverpool, England, on August 21, 1754, he was the third of seven children in a wealthy merchant family whose money came from sugar and slaves. He attended Oxford for two years and briefly studied law at the prestigious Middle Temple. When he was 19, his father died and left him a sizeable fortune, which Tarleton quickly squandered. In April 1775 he purchased a commission as a cornet in the king's cavalry, the lowest and cheapest commissioned officer rank one could buy.

With rebellion underway in North America, he took leave of his regiment the following year and crossed the

Bostonians paying the exciseman (National Archives)

Atlantic with CHARLES, LORD CORNWALLIS and participated in the failed CHARLESTON EXPEDITION OF 1776. When Cornwallis headed for New York in August, Tarleton volunteered to serve in the 16th Light Dragoons. He found his niche in the cavalry, and his rise as an officer was rapid. In January 1778 Tarleton was promoted to captain, skipping over the rank of lieutenant, and by August he was a lieutenant colonel in the British Legion, a regiment of cavalry and infantry recruited from among New York LOYALISTS. He was not yet 24 years old.

Generally described as a short, well-proportioned, and powerful man, Tarleton became infamous to the revolutionaries while becoming a national hero in Great Britain. More than once, Tarleton's British Legion drew criticism from revolutionaries for its perceived brutal behavior, earning its leader the epithets "Bloody Tarleton" and "Bloody Ban." Often this reputation came from the fact that Tarleton's men so completely overwhelmed their enemy that the battles ended up lopsided with such heavy casualties that the WHIG press declared that they were massacres. Thus after battles at Monck's Corner (April 14, 1780) and at the Waxhaws (May 29, 1780) in South Carolina, revolutionary propaganda claimed Tarleton and his men refused to give quarter to surrendering soldiers. Those same victories, especially the battle at the Waxhaws, were praised in the British press. In retaliation for his supposed actions, revolutionary soldiers at the BATTLE OF KING'S MOUNTAIN (October 7, 1780) shouted "Tarleton's Quarter" as they slaughtered surrendering Loyalists. Until the end of the war, the British Legion fought primarily in the Carolinas, participating in the successes at the BATTLE OF CAMDEN (August 16, 1780) and the BATTLE OF GUILFORD COURTHOUSE (March 15, 1780), where Tarleton lost two fingers on his right hand, and in the disastrous defeat at the BATTLE OF COWPENS (January 17, 1781), where he narrowly escaped but lost most of his men. While keeping British supply lines open in South Carolina, the legion combed the swamps in a fruitless attempt to capture guerrilla leader FRANCIS MARION. Referring to his elusive quarry as "this damned old fox," Tarleton is thus responsible for General Marion's enduring nickname of "Swamp Fox."

Tarleton's fighting days in the war ended at YORKTOWN (October 19, 1781), but the hostility toward the cavalryman did not cease. His reputation was such that, in the round of dinner parties that followed the surrender among officers of the Continental, French, and British armies, Tarleton was the only British officer not invited. He was outraged, feared for his life, and sought protection from the French, though COMTE DE ROCHAMBEAU remarked that he, too, viewed the outcast as a butcher and a barbarian. Nevertheless, Tarleton returned to adulation in England in 1782, and to a life of dissipation within the circle of friends surrounding the Prince of Wales. In 1787 Tarleton drew

fierce criticism for a published attack on his former mentor, Cornwallis, and wrote his own chronicle of the southern campaigns in the United States during 1780 and 1781, omitting reference to the disaster at Cowpens, for which he had always denied blame.

Tarleton represented Liverpool in the House of Commons for seven terms between 1790 and 1812, but his military career languished. Though he attained the rank of general in 1812, he served only in domestic backwaters and never saw action again. In 1816 he asked for and received a baronetcy, and when his old friend ascended to the throne as George IV, Tarleton became a Knight of the Bath. Infirm and ailing from gout, he died at home in 1833.

## taverns

Taverns were important institutions in the late 18th and early 19th centuries. Food, drink, and sometimes lodging could be found at a tavern. They were also a prominent locus of sociability. Whether in the city or in the country, whole communities depended on taverns to gather people together to exchange gossip and news. Taverns had economic functions as well. Deals were made in taverns and jobs could be found. Taverns along the waterfront were often rendezvous houses for recruiting sailors. Illicit activity also occurred in some taverns, including gambling and prostitution.

Before the REVOLUTIONARY WAR (1775–83), a wide spectrum of society patronized the same tavern in cities; rich and poor sat in the same room and interacted. Political discussion flowed as freely as ALCOHOL. During the RESISTANCE MOVEMENT (1764–75), groups such as the SONS OF LIBERTY often met in taverns. In New York City, for example, Montagne's Tavern, was the center of organization activity in the LIBERTY TREE controversies. At the same time there was growing social stratification in tavern going. Philadelphia's City Tavern, founded in 1773, was more expensive than others and catered to LAWYERS and merchants. Because of this stratification, some members of the elite argued against using taverns for political discussion; the first Pennsylvania state constitution (see also CONSTITUTIONS, STATE), which provided that all laws had to be published and presented before the public, was accused of encouraging tavern government. Regardless of this charge, taverns remained important in politics. During the 1790s and early 1800s, different political organizations, like the DEMOCRATIC-REPUBLICAN SOCIETIES, met in taverns.

Beyond politics, all kinds of associations met at taverns as a convenient and public location for people to congregate, including ethnic societies and early labor organizations. Within a community, a tavern owner often exerted influence on his customers, and sometimes acted as an informal banker to people who lived on the margins.

**Taylor, John, of Caroline** (1753–1824) *politician, writer*

During the early national period, John Taylor of Caroline was a leading political theorist and advocate of the type of liberal democratic thought known as Jeffersonian democracy. Born in Caroline County, Virginia, Taylor's parents died when he was a child. His uncle Edmund Pendleton took him in and gave him a good EDUCATION. After attending the College of William and Mary he studied law with his uncle and was admitted to the Virginia bar in 1774. During the REVOLUTIONARY WAR (1775–83), Taylor served in the CONTINENTAL ARMY where he attained the rank of colonel. He resigned in 1779 to serve with the Virginia militia.

Taylor was elected to the Virginia House of Delegates from 1779 to 1781, 1783 to 1785 and 1796 to 1800. As a legislator his libertarian and democratic leanings were obvious from the beginning. He was most interested in such democratic issues as RELIGIOUS LIBERTY, voting rights, and fair representation. Taylor filled two unexpired terms in the U.S. Senate and was elected to the Senate twice in his own right. In 1797 he served as a presidential elector.

A leading ANTI-FEDERALIST, Taylor's opposition to the new UNITED STATES CONSTITUTION reflected his concern that a strong central government would fail to respect individual rights. He believed that the freedom of the individual was much more secure under state governments. Taylor particularly disagreed with the ideas of nationalists like JOHN ADAMS and ALEXANDER HAMILTON, and throughout his life he remained a strong supporter of THOMAS JEFFERSON. However, he objected to President Jefferson's willingness to compromise. During a third term in the House of Delegates, his STATES' RIGHTS convictions led him to introduce JAMES MADISON's Virginia Resolu-

tion (part of the VIRGINIA AND KENTUCKY RESOLUTIONS, 1798). In his later years he was associated with a dissident group of old DEMOCRATIC-REPUBLICANS led by JOHN RANDOLPH and sometimes called the *Tertium Quid*.

Despite his active political life, John Taylor thought of himself as a gentleman farmer and author. His writings, although long and difficult, provide one of the best examples of the mixture of classical republican and more modern laissez faire ideals that characterized Jeffersonian political thought. Taylor produced his most important works during the last decade of his life. *An Inquiry into the Principle and Policy of the United States Government* (1814) was Taylor's long delayed response to John Adams' *Defense of the Constitutions of Government of the United States* (1787). His *Construction Construed and Constitutions Vindicated* (1820) contained strong arguments in favor of states' rights and a strict interpretation of the Constitution. The *Arator*, a book of essays on scientific AGRICULTURE published in 1813, provides the best examples of his agricultural ideas. As a southern planter and a slaveholder, Taylor was typical of his class in his belief that Congress could not restrict the expansion of SLAVERY into the territories. John Taylor died at Hazlewood, his Caroline County, Virginia, plantation in 1824 while filling another unexpired Senate term.

**Tea Act** (May 10, 1773)

Parliament passed the Tea Act in 1773 to aid the British East India Company, which was on the verge of bankruptcy, by allowing it to sell its tea directly to the North American colonies. There was nothing sinister in the plan, and it was not intended to corrupt American liberty. Colonial appetite for luxury items like tea had been growing in the second half of the 18th century, and much of the colonial demand for tea was met by smuggling tea from the Dutch. Before the Tea Act, British East India tea had to be shipped to England, sold on the wholesale market there, pay an English tax, and then be reshipped to the colonies, where it paid another tax since it was the only item still taxed under the TOWNSHEND DUTIES (1767) after 1770. The Tea Act did away with the reselling process and the tax in England, making it less expensive than smuggled tea. To facilitate the process further, the East India Company would contract the selling of tea to specific firms in each colony. Theoretically, everyone would win from this measure. The East

India Company would make some money. Colonists would have a cheaper product. And Great Britain would gain revenue from the Townshend Duty.

Many colonists, however, objected to the Tea Act. Smugglers and merchants who were not given the tea contracts saw their livelihood jeopardized. Others believed that the measure would corrupt colonial American society by establishing a monopoly and was a subtle way to compel compliance with the Townshend Duties. Besides protesting and petitioning against the measure, colonists in Boston staged the BOSTON TEA PARTY (December 16, 1773). Other colonies also destroyed the imported tea. These actions led to an escalating conflict with Great Britain, which passed the COERCIVE ACTS (1774), and the eventual opening of hostilities in the BATTLES OF LEXINGTON AND CONCORD (April 19, 1775).

### **Tecumseh** (1768–1813) *Shawnee chief*

In the early 19th century, Tecumseh tried to unite NATIVE AMERICANS to defend against the expansion of the United States into territories beyond the Appalachian Mountains. This movement marked the last serious opposition of Native Americans east of the Mississippi River and north of the Ohio River against the relentless European-American demands for more land.

Born in a village on the Mad River in what is now Ohio, Tecumseh had a Shawnee father and a CREEK mother. His father died fighting British and Virginians in Dunmore's War (1774). Soon after, Tecumseh's mother gave birth to triplets. One of the babies died but the surviving boy and girl grew into adulthood. The baby boy, Tenskwatawa (1775–1836), became an important religious leader known as the Shawnee PROPHET.

For many Indians in the Ohio River valley, the REVOLUTIONARY WAR (1775–83) did not end with the TREATY OF PARIS (1783). By the early 1780s, Native groups such as the Shawnee believed they were winning the war against the United States and felt as if the British peace treaty had given away their land—the treaty ceded to the United States the territory south of the Great Lakes and east of the Mississippi River—without concern for the Native Americans living there. Throughout the 1780s and into the early 1790s, the Indians north of the Ohio River resisted incursions of European Americans. Tecumseh participated in this resistance. In 1790 and in 1791 an Indian confederacy defeated armies under Josiah Harmer and ARTHUR ST. CLAIR in defense of their lands. Although the United States finally won a victory at the BATTLE OF FALLEN TIMBERS (August

20, 1794) and opened half of Ohio to European-American settlement with the TREATY OF GREENVILLE (1795), many Indians remained unhappy with the situation.

Against this backdrop, Tecumseh and Tenskwatawa began to develop a pan-Indian movement in the early 1800s that had both a religious and a military dimension. In April 1805 Tenskwatawa had a vision that changed his life. He told his friends and neighbors that they must return to the old ways, to give up drinking and to avoid relying on the manufactured goods brought in by the traders. Tecumseh listened to his brother's vision and believed that his message might unite the various tribes west of the Appalachians. For the next few years, the two brothers spread their ideas from Alabama to Wisconsin. Tenskwatawa settled at Prophetstown on the Tippecanoe River in what is now western Indiana, where his followers could live far from the corrupting European-American society. Tecumseh traveled to many different tribes to convince them to join together to protect their lands. This mission was difficult since many of tribes were bitter enemies.

The territorial governor of Indiana, William Henry Harrison, recognized the threat posed by this revitalization movement and suspected that the British in CANADA were helping Tecumseh with weapons and supplies. Tecumseh and the governor met several times in the first decade of the 19th century but could not reach any agreement. During one conference in Vincennes (1810) they became so angry at each other they drew weapons and almost started fighting.

Harrison marched on Prophetstown with an army of about 1,000 men while Tecumseh was traveling and Tenskwatawa was in charge. Against his brother's advice, the Prophet attacked Harrison's camp, promising his warriors that the enemy bullets would not harm them and hoping to catch Harrison by surprise. Although they had some initial success in the battle, the Indians were beaten back with heavy casualties. The defeat in the BATTLE OF TIPPECANOE (November 7, 1811) hurt Tecumseh's pan-Indian movement, and he retreated to British Canada.

During the War of 1812 (1812–15), Harrison invaded Canada and defeated a mixed force of Native Americans and British soldiers at the Battle of the Thames (October 5, 1813). Tecumseh died in the fighting. Many people in the United States viewed Tecumseh's death as a great triumph, marking the end of serious Native American resistance in the old Northwest. Congressman Richard M. Johnson, who led a unit of Kentucky militia in the battle, claimed to have killed Tecumseh and became a national hero. Some of his soldiers took locks of Tecumseh's hair, pieces of clothing, and even patches of his skin (which were then cured for storage) as souvenirs. Subsequently, Tecumseh has become a symbol for both Native Americans and European Americans of the noble Indian willing to risk all to defend his land and his people.

**Further reading:** R. David Edmunds, *Tecumseh and the Quest for Indian Leadership* (Boston: Little, Brown, 1984).

## temperance

Temperance, the drive to restrict ALCOHOL consumption, was the longest running social reform movement in the United States, beginning in the 1740s and culminating with the Eighteenth Amendment. From 1761 to 1812, Americans, for the first time, began to express concerns about alcohol consumption and to envision a world in which alcohol was not permitted.

The first stirring of temperance arose in the medical community in the 1740s. Physicians, particularly Philadelphian BENJAMIN RUSH, noted a new disease then called the WEST INDIES dry gripes, which caused a painful death in those who drank rum (later discovered to be lead poisoning from the West Indies lead stills). Rush's experiences during the REVOLUTIONARY WAR (1775–83), when he worked for the CONTINENTAL ARMY, furthered his concerns regarding alcohol and led him to publish pamphlets detailing the dangers of hard liquor. For example, in Rush's 1784 booklet, "Inquiry into the Effects of Spirituous Liquors on the Human Body and Mind," he asserted that spirits transformed a person into "in fetor, a skunk; in filthiness, a hog; in obesity, a he-goat."

Rush's recommendations went mostly unheeded until the early 19th century. By then an increasing consumption of whiskey and resulting drunkenness began to lead to anxiety about the moral rectitude of the newborn republic. When a doctor named William Clark read Rush's pamphlet about the evils of drunkenness he showed it to his minister, who in turn shared it with influential members of their small New York town. These citizens banded together on April 30, 1808, to establish the first formal temperance group in the United States, the Union Temperance Society of Moreau and Northumberland. In 1813 Reverend Lyman Beecher also read Rush's pamphlet and helped to found the Connecticut Society for the Reformation of Morals, a group focused on temperance. Other clergy soon founded similar organizations.

The success of ministers in establishing temperance groups is partly explained by the worry of the developing middle class about finding sober workers. Businessmen also feared that increased alcohol consumption would disrupt social relationships, particularly as employer-employee relationships changed during the early 19th century. Until this period, employees generally lived with their employers, and employers were responsible for the welfare of their workers. The new emphasis on family privacy and on the home as a refuge from the workplace in the early 19th century led employers to remove workers from their

homes. Businessmen, especially in New England, may have felt guilty about leaving workers to fend for themselves and fearful of the workers over whom they exercised less and less control. When Presbyterian and Congregationalist ministers began preaching about self-discipline and sobriety, the new business class, perhaps in order to relieve their guilt, agreed with this message enthusiastically.

Employers discovered that the ministers' message released them from responsibility for their workers. Employers' wives found the new message exciting because it gave them an important role in instilling self-discipline in the republic. Women founded organizations to curb prostitution, reform asylums and orphanages, help widows with young children, and reduce drinking. Women's temperance efforts were more successful than their other social reform labors. Their exertions were aided by improvements in water sanitation, which made water safe to drink. However, the temperance movement remained in an embryonic stage before 1812 and tended to emphasize moderation rather than complete abstinence. Only in the 1830s and 1840s did the movement push for the complete abandonment of all consumption of alcohol and achieve national prominence.

## theater

North American theater underwent a dramatic transformation from 1761 to 1812. In the colonial period theaters had a difficult time sustaining themselves and performances were usually in barns or a building that had been adopted temporarily for stage production. By 1812 almost every self-respecting city had a theater of its own.

During the 1750s theatrical troupes traveled to New York, Philadelphia, Williamsburg, and other locations, but they could not find a permanent home. Part of the problem was that the cities and towns were too small to sustain permanent establishments, and part of the problem was the moral objections to the theater held by many among the public. During the STAMP ACT (1765) crisis, for example, New York's theater closed its doors. When the theater opened again in the spring of 1766, a crowd shouting "Liberty, Liberty" stormed into the building, attacked the patrons, and tore the place apart because the theater

Philadelphia's Chestnut Street Theater opened in 1794 but was destroyed by fire in 1820. A new theater with the same name opened in 1822. Engraving (*Library of Congress*)

seemed an inappropriate extravagance at the time. During the REVOLUTIONARY WAR (1775–83), WHIGS continued to oppose theaters as a violation of their REPUBLICANISM. British officers, however, loved the theater and often organized their own performances. Major JOHN ANDRÉ was known for this type of activity.

Although the debate over theater continued in the United States after the war was over, opposition was not so strong as to prevent performances. GEORGE WASHINGTON enjoyed the theater and believed that it could be a means to inculcate morality. It is in this spirit that ROYALL TYLER wrote his play *The Contrast* (1787). Opponents, however, viewed theaters as a symbol of corrupt aristocracy and a place of immorality. As theaters developed in the 1790s and early 1800s in several cities, the antitheater adherents had an argument. Prostitutes used the theater as a place to rendezvous with customers, and audiences became rowdy and disorderly.

Regardless of their morality or lack of morality, theaters spread throughout the United States in the early national period. Philadelphia's Chestnut Street Theater opened in 1793, followed by New York's Park Theater in 1795. Other cities and towns built theaters as well. Productions were varied. Sometimes the theater would include Shakespeare or a more contemporary play. Often, the theater production would contain greater variety, with different skits, short plays, and musical performances. Theater managers, such as WILLIAM DUNLAP, strove to hire popular talent from England to draw in an audience. But actors from the United States became increasingly popular on their own.

Despite the popularity of theaters, they remained controversial. After the fire at the Richmond Theater on

December 26, 1811, which killed 72 theatergoers, many people wondered if the tragedy was an act of God punishing those attending the sinful production.

### Tippecanoe, Battle of (November 7, 1811)

The Battle of Tippecanoe (near present-day Lafayette, Indiana) disrupted TECUMSEH's federation of NATIVE AMERICAN tribes in the Old Northwest, allowing the United States to strengthen its hold on the region. After the battle, Tecumseh and his followers relied even more heavily on British aid and sanctuary in CANADA, unable to mount effective resistance in the United States. The engagement also brought the territorial governor of Indiana, William Henry Harrison, to national prominence.

The Tippecanoe River ran near the village of Prophetstown, named for Tecumseh's brother, the Shawnee Prophet, Tenskwatawa. The settlement thrived during the end of the first decade of the 19th century, attracting members of many different tribes who joined Tecumseh's pan-Indian movement and responded to Tenskwatawa's call for a return to Indian traditions. The site also offered access to Canada so the inhabitants could draw upon supplies and weapons from the British. However, more and more European-American settlers poured into the region, leading to conflict. Governor Harrison, in particular, came to view Prophetstown as an obstacle to further development in Indiana territory. Several meetings between Harrison and Tecumseh only convinced Harrison that he needed to strike before the Indians gathered more strength. In 1811 he collected about 700 militia and, with 350 regulars under Colonel John P. Boyd, marched on Prophetstown. When this army reached its destination on November 6, Tenskwatawa and Harrison agreed not to attack one another so that they could open negotiations the next day.

Unfortunately for the Indians, Tecumseh had traveled to the South to see if he could get tribes in that region to join his pan-Indian movement. Tecumseh had warned his brother to avoid open hostilities until he could gather enough warriors to assure victory. Tenskwatawa, however, decided that he needed to attack Harrison and Boyd before they could attack him. He therefore told his followers that the enemy bullets would have no effect on them and planned a predawn attack. Harrison and Boyd had prepared for this contingency, ordering their men to sleep by their arms, setting camp behind fieldworks formed

into a rough square, and posting plenty of pickets. A few hours before daybreak about 600 to 700 Indians launched a ferocious assault. The militia and regulars responded well to the surprise and in an intense two-hour battle finally compelled the Indians to retreat. Thirty-seven soldiers lay dead and more than 126 were wounded (another 25 were to die from their wounds). Native American casualties are unknown but must have been high as well, since the Indians abandoned the town and dispersed. The situation for Harrison and Boyd remained tense as they expected another attack at any moment from Tecumseh, who they believed to be returning from the South. After a sleepless night on November 7, the army moved into the village the next day and burnt it together with all of the food supplies.

In the aftermath of the battle, Tenskwatawa lost credibility, and Tecumseh decided to head for Canada to work more closely with the British. Although Harrison eventually emerged with an enhanced reputation, at first there was some controversy about who deserved credit for the victory—Harrison or Boyd—and there was some debate over the tactics used in the battle.

### Townshend Duties (June 29, 1767)

Led by Charles Townshend, the British Parliament passed customs duties in 1767, called the Townshend Duties, to raise revenue from the North American colonies. This measure triggered a new wave of conflict between the colonies and Great Britain.

The Rockingham administration that had repealed the STAMP ACT (1765) in the spring of 1766, and that appeared so favorable to the colonies, did not last through the summer after repeal. In its place WILLIAM PITT, now Lord Chatham, organized a new government. Chatham, however, was not the same energetic man who had led Britain to victory in the French and Indian War (1754–63). The leadership of his administration soon fell into drift, and Charles Townshend ended up playing a leading role in molding policy by the spring of 1767. A £500,000 tax cut in Great Britain, combined with continued colonial expenses, convinced Townshend to raise revenue in North America for colonial administration. News that the colonial assembly in New York had refused to comply with the QUARTERING ACT of 1765 further aggravated the situation. Some colonial Americans had distinguished between internal and external taxation, including BENJAMIN FRANKLIN in testimony before Parliament, during the Stamp Act crisis. Internal taxes, like the Stamp Act were intended to raise revenue within the colonies and were by right, so colonial

Americans claimed, the province of their own assemblies. External taxes were duties and regulations that governed imperial relations and were within the powers of Parliament to manage the empire. Townshend decided to use this distinction and have Parliament pass duties on glass, lead, painter's colors, paper, and tea imported into the colonies. These "external" taxes would raise about £40,000. This money was to be used to pay royal officials in the colonies and make them independent of the colonial assemblies. In addition, Townshend also had passed a series of rules and regulations to make customs collection more efficient, including the expansion of the Admiralty Court system (see also VICE-ADMIRALTY COURTS).

Colonial Americans were unsure of how to respond to the Townshend Duties, and the RESISTANCE MOVEMENT (1764–75) never assumed the full proportions it had against the Stamp Act. Some colonists acknowledged that Parliament may have acted within its proper bounds by passing the customs regulations, even if the intent was to raise revenue. Others began to argue that the distinction between internal and external taxes was invalid if the external tax was not to regulate the empire, but to raise money. This point gained in popularity after it appeared in JOHN DICKINSON's *Letters from a Pennsylvanian Farmer* (1767–68). Still, attempts to set up nonimportation agreements had difficulty getting started, as merchants in some seaports refused to join in, undercutting the efforts of merchants in other seaports. The Massachusetts legislature strove to take the lead, issuing a Circular Letter (February 11, 1768) admitting the right of Parliament to be "the supreme legislative Power over the whole Empire," but asserting that it was one of the "fundamental Rules of the British Constitution" that an individual could not have his property taken away from him without his own consent—in other words, only the direct representatives of the colonists could tax the colonies. Since only a few colonial assemblies were in session, the response to this letter was not great.

In 1768 and 1769, however, tensions between the colonies and Great Britain increased, especially in Boston. The Massachusetts Circular Letter had alienated Governor FRANCIS BERNARD from the assembly. Simultaneously, conflicts erupted in the street between newly appointed customs officials and the people of Boston. Several RIOTS ensued, especially after custom's agents seized JOHN HANCOCK's sloop the *Liberty* in June 1768 (see also LIBERTY RIOT). To help control the situation, the British government ordered troops to Boston. Against this backdrop, resistance began to spread. Customs officials were harassed in several ports, and some crowds began to use tarring and feathering as a means to humiliate a few lower officials. By 1769 a nonimportation movement finally began to take hold across the colonies. Animosity between the British troops in Boston and New York City, which was as much

over the competition for jobs as imperial problems, led to confrontations known as the **BATTLE OF GOLDEN HILL** in New York (January 18, 1770) and the **BOSTON MASSACRE** (March 5, 1770) in New England's leading port.

By the time those two conflicts took place, the leaders of Parliament had decided to abandon the Townshend Duties. Recognizing the unpopularity of the measures in the colonies, and realizing that the hoped for revenue was not forthcoming, a new set of ministers decided to abandon the regulations. The government under **LORD FREDERICK NORTH** in April 1770 repealed all the duties, except the tax on tea. Like the **DECLARATORY ACT** (1766), the one remaining duty on tea was meant as a symbolic gesture to assert Parliamentary supremacy. The repeal effectively defused the imperial crisis until 1773.

## trade

The British North American colonies had always been involved in overseas trade. By the mid-18th century the colonies were well integrated into an Atlantic trade network not only with western Europe but also with Africa and the **WEST INDIES**. Much of this trade was connected to **SLAVERY** since crucial colonial exports such as tobacco and rice depended upon slave labor. In addition, because the West Indies produced sugar to the exclusion of other goods, the North American colonies also exported lumber, fish, and grains to the Caribbean. Much of the North American contact with Africa centered on the international **SLAVE TRADE**. Before 1750, on the other hand, intercolonial trade was not well developed.

In the revolutionary era, the Atlantic trade continued to be important, but inland or domestic trade began to increase. Colonial farming families produced a variety of items, including cloth, hats, deerskin, beaver pelts, barrels, rum, cider, and whiskey, to supplement incomes. Towns such as Lancaster, Pennsylvania, and Elizabeth, New Jersey, became important centers for this trade. By the 1770s more and more colonial Americans focused on buying, selling, and making profits. The trade expansion of the mid- and late 18th century also produced an increased demand for paper money, which was restricted by British regulations.

While in many ways the **REVOLUTIONARY WAR** (1775–83) disrupted these developments, the conflict also created new opportunities. Warships and privateers (see also **PRIVATEERING**) threatened the overseas trade of both sides. But independence opened new markets. Similarly, marching armies and military depredations might cut off some trade.

But the goods required to wage war increased the demand for domestic trade. Equipping the British, Continental, and French armies meant big business for farmers now preoccupied with the market. They produced foodstuffs and supplies for armies on the move. Increased inland trade during the war and just after led to many political efforts to create a ready supply of paper money in various states in the 1780s.

The **SECOND CONTINENTAL CONGRESS** hoped to usher in a new age in foreign relations by asserting a policy of free trade. Even before the **DECLARATION OF INDEPENDENCE** (July 4, 1776), Congress opened up all ports to foreign vessels on April 6, 1776. Congress created a model commercial treaty, written largely by **JOHN ADAMS**, in the fall of 1776, which it hoped would form the basis of relations with France and other countries. This model treaty stipulated that merchants from the United States should pay the same duties as the merchants from the other nation signing the treaty. The French commercial treaty of 1778 fell short of this ideal, granting a reciprocal “most-favored-nation” status instead—stating that merchants from the United States would pay the same duties as those merchants from countries who paid the lowest duties. However, the treaty still asserted a belief in “free ships make free goods,” which reflected the ideals of the Enlightenment and guaranteed the rights of neutral shipping. The commercial treaties signed with the Netherlands (1782), Sweden (1783), and Prussia (1785) all followed the pattern set by the French commercial treaty.

Despite these commercial treaties, a postwar recession and regulations by foreign nations led to problems in international trade during the 1780s. The commercial treaties with European nations had little real impact on commerce in the United States since American merchants had limited access to credit in these nations. Great Britain, which refused to make a commercial agreement with the United States, continued to dominate American commerce because of longtime credit relations and the fact that the British manufactured inexpensive goods desired by many consumers in the United States. Moreover, the mercantilism of the European powers continued to keep their colonies officially closed to the United States. This situation not only made trade with the West Indies difficult—illegal trade continued and local governors might suspend restrictions in dire circumstances—but it also blocked trade on the Mississippi River since Spain had no treaty with the United States and refused to allow western farmers to export products through New Orleans.

There were also problems with internal trade. The economic downturn severely depressed all manner of commercial exchange in the nation and underscored the need for more available and stable paper currency. The various commercial policies of the states contributed to trade confusion.

Painting showing dockworkers unloading sugar and cotton from the *John*, a merchant trade vessel, at a busy Salem, Massachusetts, wharf (Library of Congress)

Some states had their own imposts leading to a maze of regulations that confused the status of interstate trade.

The UNITED STATES CONSTITUTION attempted to address these problems by creating a uniform trade policy. Under the Constitution, only the national government could make treaties and levy an impost. In addition, the document mandated a national market, asserting “No Tax or Duty shall be laid on Articles exported from any State.” The men at the CONSTITUTIONAL CONVENTION (1787) also addressed currency problems by barring states from issuing their own currencies and creating a legal tender that was exclusively national. (However, individual BANKS continued to issue banknotes to be used as currency well into the 19th century, both facilitating and complicating domestic trade.)

The Constitution and even ALEXANDER HAMILTON’s financial plan had a limited impact on trade and the national ECONOMY. However, the FRENCH REVOLUTION (1789–99) and the Anglo-French wars that began in 1793 dramatically altered the situation. Exports from the United States of items such as whale oil, wheat, tobacco, COTTON, and fish grew from \$20.2 million in 1790 to \$108.3 million in 1807. Imports expanded at a similar rate. Merchants attained

unprecedented wealth by shipping goods from French and British colonies through a reexport market to the United States and then to Europe. This trade barely existed in 1790 and reached \$60 million by 1807. Products of this reexport trade from the West and East Indies included coffee, sugar, cocoa, silk, spices, and dyes. Some merchants amassed huge fortunes, such as STEPHEN GIRARD of Philadelphia, Robert Oliver of Baltimore, and Thomas Boylston of Salem. An entrepreneurial spirit abounded, and the CHINA TRADE, which began in 1784 when the *Empress of China* sailed from New York to Canton, China, expanded with items such as tea, silk, and porcelain. INSURANCE companies proliferated, and large commercial banks prospered by providing merchants with credit and capital to sustain operations. Examples of these commercial banks include the BANK OF THE UNITED STATES (Philadelphia), BANK OF NORTH AMERICA (Philadelphia), and the Bank of New York (New York).

This prosperity spread through much of the society. The mercantile boom was especially good for port cities such as Baltimore, Salem, Boston, Philadelphia, Portsmouth, Charleston, New York, and Savannah. For example, Baltimore’s population grew by 156 percent between 1790

and 1810, as the city became a center of trade through the reexport market and by exporting flour milled from Susquehanna and Chesapeake wheat. New opportunities arose for ARTISANS, sailors, shipbuilders, and others sharing in the commercial wealth. Even THOMAS JEFFERSON's vaunted yeoman farmers benefited since they produced the grains that filled the ships heading across the Atlantic.

The difficulty for the United States was maintaining neutrality in a world at war. From 1793 to 1812 the United States teetered on the edge—and sometimes over the edge—of hostilities a number of times. In 1793 the British government asserted an extensive definition of contraband and instituted the Rule of 1756 outlawing trade between France and its colonies carried by neutral countries. This action almost led to war as Congress discussed reprisals and passed a trade embargo for 60 days in the spring of 1794. JAY'S TREATY (1794) defused the crisis by establishing most-favored-nation status between Great Britain and the United States and by abandoning the idea that free ships made free goods. The United States, however, could continue with some reexport trade as long as the products were not contraband as defined in the treaty and were actually taken to a port in the United States before being shipped across the Atlantic.

Jay's Treaty had an impact on the relations between the United States and other nations. The Anglo-American accord convinced Spain to agree to the PINCKNEY TREATY (1795), which regularized commercial relations, conceded generous boundaries, opened navigation of the Mississippi, and provided the right of deposit in New Orleans. This agreement facilitated both the international and the internal trade of the United States. The French saw Jay's Treaty as a refutation of the treaties of 1778 and began to seize U.S. merchant vessels in 1797, leading to the QUASI-WAR (1798–1800). The Convention of 1800 ended this undeclared war. The Peace of Amiens between Great Britain and France (1801–03), while hurting U.S. overseas trade, also removed any reason for conflict concerning trade.

Inland trade steadily expanded in the 1790s as foreign trade increased. Gradually, more and more farmers and artisans earned profits from AGRICULTURE and manufacturing. Inland villages grew into towns as centers of specialized production for sale in regional markets. One example of this phenomenon was Franklin, Massachusetts, which produced 6,000 hats annually by 1810. Gettysburg and Carlisle, Pennsylvania, are two more villages that expanded into market towns between 1790 and 1810. Inland trade in textiles, leather goods, beer, bricks, wheat, iron, paper, vegetables, meats, iron tools, wagons, shoes, and other products increased throughout the period. With this trade expansion there was an increase in transportation facilities with the building of roads and turnpikes. In 1792 there were 1,875 miles of post roads; by 1812 there were almost

40,000 miles of post roads connecting vast swaths of new territory.

The international trade situation worsened in Jefferson's second term. Resumption of the war between France and Great Britain led to another expansion of neutral trade, but it ultimately created insurmountable problems for the United States. Both France and Great Britain passed a series of regulations that made neutral trade almost impossible by 1807. The Jefferson administration responded with the EMBARGO OF 1807, believing that Europe needed American food more than Americans needed European luxuries. The embargo was a failure and devastated the trade of the United States. Efforts to continue to use trade as a diplomatic weapon with the NON-INTERCOURSE ACT (1809) and MACON'S BILL NO. 2 (1810) did little to alleviate the crisis in foreign relations, and the United States drifted toward war with Great Britain in 1812.

**Trenton and Princeton, Battles of** (December 26, 1776, and January 3, 1777)

After the disastrous campaign of the summer and fall of 1776, General GEORGE WASHINGTON gained two crucial victories by attacking outposts at Trenton and Princeton in New Jersey and forcing a British withdrawal to the area immediately surrounding New York City. While these victories did not significantly impair the British army, they represented a major political coup, rallying the supporters of independence and gaining international attention.

Washington's army experienced a string of defeats starting with the BATTLE OF LONG ISLAND (August 27–30, 1776) that compelled him to abandon New York City, the lower Hudson River valley, and most of New Jersey. He was lucky to escape the British war machine with any troops. By the beginning of December he had been driven into Pennsylvania and had only a few thousand men, many of whom would soon go home as their enlistments ran out. In this circumstance, he planned something daring.

Flush with victory, General WILLIAM HOWE ordered his army into winter quarters on December 14. Not

expecting an attack, he strung out his forces along a line in New Jersey that ran from the Delaware near Trenton to New Brunswick in the east. Howe knew he was vulnerable, but having issued a proclamation offering a pardon to all who signed a loyalty oath to the king, he sought to defend the king's newly identified subjects. Winter weather and the dispirited condition of the CONTINENTAL ARMY, he believed, would help protect his exposed forces.

Washington devised a multipronged attack across the Delaware for late December. He crossed the river on Christmas night, but ice and blizzard conditions prevented two other units farther south from doing the same. Washington divided his 2,300 men in New Jersey into two columns, ordering them to advance on Trenton and attack simultaneously. Amazingly, they arrived at Trenton almost at the same time on the morning of December 26, and their combined assault surprised the HESSIAN garrison. Despite the element of shock, and the completeness of the victory, 500 Hessians escaped from Trenton. With other British forces nearby to the south at Mt. Holly, and to the north at Princeton, Washington recrossed the Delaware into Pennsylvania. During the next several days, Washington began to realize the effectiveness of his attack, as the Hessians withdrew from all of their advanced positions. He crossed the Delaware again and by December 31, 1776, had concentrated 5,000 men and 40 howitzers at Trenton.

The British, however, wanted to reverse the loss of Trenton. CHARLES, LORD CORNWALLIS, with 5,500 regulars, advanced on Washington's position. By January 2, 1777, Cornwallis believed that he had Washington trapped at Trenton, pinned down between a superior British force and the Delaware River. Delayed by small units from Washington's army, Cornwallis arrived at Trenton toward the end of the day and decided to wait until the next morning to finish Washington and end the rebellion. That night, Washington slipped the trap. Keeping a small force in Trenton to maintain campfires and to make noise digging entrenchments, the Continental army used a road to the south to advance on Princeton. On the morning of January 3, 1777, a British regiment under Colonel Charles Mahwood heading to support Cornwallis detected Washington's army near Princeton. Mahwood, with much fewer men, attacked. An intense battle ensued, and the revolutionaries were almost driven back before Washington rallied his men, drove Mahwood off, and captured the outpost at Trenton. Again, however, many of the British soldiers escaped, some to join Cornwallis at Trenton, others to the British depot at New Brunswick. Regardless of this shortcoming, Washington's victories were complete. The British decided to abandon most of New Jersey, maintaining posts only at Amboy and New Brunswick. Washington took his army to a winter encampment at MORRISTOWN, New Jer-

sey, and both armies awaited the spring of 1777 to renew the campaign.

See also REVOLUTIONARY WAR.

### **Trumbull, John** (1756–1843) *painter*

More than any other artist, John Trumbull is responsible for our image of the REVOLUTIONARY WAR (1775–83). His 250 to 300 historical paintings of battles and events, such as the signing of the DECLARATION OF INDEPENDENCE (July 4, 1776), faithfully represent the people and the scenes that made the United States.

The son of Governor Jonathan Trumbull of Connecticut, a young John Trumbull wanted to study art with JOHN SINGLETON COPLEY. His father packed him off to Harvard instead. Shortly after he graduated, the Revolutionary War broke out and Trumbull obtained a commission in the CONTINENTAL ARMY. He saw action at DORCHESTER HEIGHTS (March 4–5, 1776), and was in high demand as an aide because of his ability to draw. He left the army in 1777, serving briefly again as a volunteer in the Rhode Island campaign in 1778. He tried his hand in several speculative ventures during the war, but in 1780 he obtained special permission to go to England where he studied with BENJAMIN WEST. On November 19, 1780, the British government arrested him for treason—the arrest may have been in retaliation for the execution of Major JOHN ANDRÉ. Trumbull was quickly released and left for the Continent.

He returned to the United States in 1783. Over the next decade Trumbull traveled extensively in Europe and the United States. It was also his most productive period as an artist, during which he painted some of his best known historical works such as the *Battle of Bunker Hill* and the *Death of General Montgomery in the Attack on Quebec*. He began his most famous painting, *The Declaration of Independence*, by 1789 but took eight years to complete it. He painted 36 of the 48 individuals in the work from life. He also used a sketch of the arrangement of the room by THOMAS JEFFERSON to capture the surrounding detail. Between 1794 and 1800 he served as secretary to JOHN JAY. After 1800 he relied on his painting to earn a living, which became increasingly difficult for him as most critics believed that his best work was behind him. He painted large, if imperfect, copies of some of his historical paintings for the new U.S. Capitol building in 1816 and 1817. Yale

set up a gallery for his work in 1832 and provided Trumbull with a stipend for the remainder of his life.

### **Tyler, Royall** (1757–1826) *playwright*

Even with a successful career as a jurist, Royall Tyler's greatest accomplishments appeared in LITERATURE and the THEATER. Tyler wrote *The Contrast* in 1787, a comic play that satirizes social pretensions. In the wake of the REVOLUTIONARY WAR (1775–83), Tyler became a literary voice of the AMERICAN REVOLUTION.

Tyler was born in 1757 to a prominent Boston family. With his inheritance, Tyler attended Harvard College, earning a B.A. in 1776. He continued his studies, receiving a Harvard M.A. in 1778 and admission to the bar in 1780. Tyler practiced law in Maine for two years before returning to Boston.

After an unsuccessful courtship of Abigail Adams, daughter of JOHN and ABIGAIL ADAMS, Tyler sought to mend his broken heart by joining the campaign against the SHAYS'S REBELLION (1786–87) in western Massachusetts.

Despite Tyler's limited success in the campaign, his efforts caught the attention of Governor James Bowdoin. Tyler was sent to New York City in March 1787. It was his first encounter with New York City and its theater. In just over a month, Tyler wrote *The Contrast* and saw it performed by the American Company at the John Street Theater. The play was the first professionally produced American comedy.

Influenced by Richard Sheridan's *The School for Scandal* (1777), Tyler's *The Contrast* highlights the differences between American and British values and manners. In the end, the play champions blunt American pragmatism over duplicitous British formalism. One character, Brother Jonathan, stands out as a no-nonsense, honest fellow. This character developed a life of its own in American folklore and literature. Some scholars have even claimed that the character is the prototype for Uncle Sam, the personification of the U.S. government.

A successful essayist and author, Tyler continued to practice law, eventually serving as chief justice of the Vermont Supreme Court. As the initially unsigned playwright of *The Contrast*, however, he captured elements of the era in a comedy of manners.

## Unitarianism

American Unitarianism developed in Boston and eastern Massachusetts during the decades following the REVOLUTIONARY WAR (1775–83). Unitarians questioned many of the central tenets of orthodox Calvinism. They downplayed original sin, arguing instead that humans were capable of both good and bad acts and that they were responsible for their own moral decisions. Moreover, Unitarianism was greatly influenced by the historicism of German biblical criticism. Although Unitarians agreed with their orthodox counterparts that the Bible was the final authority in all matters of theology, they also believed that the Bible was a historical product written by men. Thus, the Bible could not be taken at face value but must be interpreted through scholarship and the use of reason. For some Unitarians, this approach—a tradition that dated back to 17th-century radical Protestantism—offered the possibility to access the “true” Bible without the corruptions of subsequent writers and theologians. To orthodox thinkers, however, any questioning of the Bible was tantamount to heresy.

The roots of Unitarianism can be traced into the 18th century. In North America, many proto-Unitarian ministers, such as Charles Chauncy, were critical of the enthusiasm associated with the revivals of the First Great Awakening. More importantly, Unitarianism owed much to the Enlightenment. Unitarians valued the application of reason over faith, and were therefore more willing to question the Bible when it challenged common sense or the laws of nature. A central contention of Unitarians was that the Trinity was unjustified both by Scripture and by reason. They believed that Jesus was the subordinate son of God, and not his equal, hence the term “unitarian.” God was a single entity, and not a composite of three disparate parts.

The most famous moment in American Unitarianism is no doubt the “Unitarian Controversy” of 1805. The controversy was caused by the decision of Harvard to appoint

Henry Ware to the Hollis Professor of Divinity. A known liberal, Ware’s appointment was seen as an affront to orthodox Congregationalists. Moreover, the controversy exposed a class division within Massachusetts Congregationalism with many members of the eastern political elite aligned with Unitarianism’s liberal theology, even though it was a minority within the state. Orthodox minister JEDIDIAH MORSE launched a vitriolic campaign against Ware and, by 1807, many orthodox ministers deemed Harvard unfit to prepare ministers. They turned instead to Williams College and the newly established Andover Seminary.

The 1805 controversy brought divisions between liberals and orthodoxy into the open, making it more difficult for the two camps to exist peaceably within the same parish churches. In 1812, prominent orthodox ministers refused to share pulpits with liberal clergymen. Throughout the 1810s and 1820s, parishes divided between liberal and orthodox elements, making the establishment ineffective and unwieldy. In the context of these divisions, Unitarian leader Reverend William Ellery Channing’s 1819 speech “Unitarian Christianity” laid the groundwork for a complete break between liberal and orthodox Congregationalists. In this speech, Channing made clear that reason and SCIENCE must mediate the truths within the Bible. In 1825 Channing and others founded the American Unitarian Association, thus making their separation from orthodox Congregationalism official.

## **Valcour Island, Battle of** (October 11, 1776)

Although the British won the Battle of Valcour Island on Lake Champlain, the fact that they had to build a fleet of ships to fight a revolutionary flotilla delayed an invasion from CANADA for a year. That extra year was vital. When General JOHN BURGOYNE advanced south from Canada in 1777, he ultimately met a huge army and was compelled to surrender at SARATOGA (October 17, 1777).

From the autumn of 1775 to the summer of 1776, the revolutionaries gained control of Lake Champlain and created a small fleet of vessels to prevent any British invasion from Canada. They built several gunboats and galleys at a shipyard at Skenesborough, below FORT TICONDEROGA. The revolutionaries succeeded almost in spite of themselves, as petty differences between the military leaders, and between the states, hampered military activity. Ultimately, command of the lake forces fell to BENEDICT ARNOLD, who combined his experience at sea with his energy as a leader. The British, who held St. Johns on the northern shore of the lake, built a more powerful fleet of their own. Arnold sailed up the lake to Valcour Island, anchoring his vessels in a defensive line, hoping that his stationary vessels could outgun the heavier British vessels as they tacked to get into position to fire. The idea was to have the British sail south of Valcour Island and attack them from the weather gauge. The British spotted Arnold's ships as they cleared the southern end of the island. Their superior seamanship and firepower pummeled Arnold's forces. By nightfall, Arnold was lucky to escape south along the lakeshore past the British ships. Pursued the next day, Arnold's men ran the vessels that had not been captured ashore and set fire to them. Arnold then led the remnants of his men to Fort Ticonderoga, just ahead of pursuing NATIVE AMERICANS. The Continental naval forces on Lake Champlain had been destroyed or captured and the path for invasion cleared. But with winter coming on, the British had to wait until the spring of the next year to push farther south.

## **Valley Forge** (1777–1778)

On December 19, 1777, with the campaign season at an end and the British in control of Philadelphia, GEORGE WASHINGTON took his ragged CONTINENTAL ARMY into winter quarters at Valley Forge, Pennsylvania, about 20 miles northwest of the occupied capital. It was a hilly, wooded site at the junction of the Schuylkill River and Valley Creek, far enough from the city so the British could not approach unnoticed, and a secure base from which the revolutionaries could counter enemy expeditions into the area. With the implementation of a skillfully planned system of entrenchments, fortifications, and artillery placements, Valley Forge was virtually impregnable by late winter. Battling deep snow and freezing temperatures was another matter, however. That winter, of the approximately 11,000 soldiers that constituted Washington's army, almost 3,000 were unfit for duty due to lack of shoes and clothing. Adequate shelter became their first priority, and the men immediately began felling trees and building log huts. Washington offered cash prizes for the best and fastest built and for the best roofing material they could concoct. More than 1,000 huts were built, most being completed by the end of the year. Once his men were adequately housed, Washington moved out of his own tent and into rented quarters in the village, the Isaac Potts house.

The general's troubles were many that winter. Aware that factions within the army and in the SECOND CONTINENTAL CONGRESS doubted his leadership abilities and wanted him removed as commander in chief, Washington weathered the CONWAY CABAL while at Valley Forge.

Baron von Steuben at Valley Forge, 1777 (*National Archives*)

Despite the fact that Pennsylvania and the other colonies were not destitute of supplies, procuring and issuing provisions to the army through official channels was a continual problem. Meat and bread were often unavailable for days at a time. Medicines, bedding straw, blankets, drinking water, salt, and ALCOHOL (an integral part of the 18th-century diet) were also severely limited. Much of the army was virtually naked, forcing men to borrow clothes from one another when called upon to stand guard duty. Those without shoes stood on their hats to protect their feet from the snow. And when the various states did send provisions for their Continental regiments, they were for their own state troops only, resulting in an uneven distribution of goods, with units from the larger and wealthier states being the best supplied. Nor was the want limited to the army's human contingent. Horses, used as cavalry mounts and to pull wagons and artillery pieces, also faced starvation. To ease the demands on what fodder was available, Washington sent a detachment of cavalry to Trenton for the winter. Nevertheless, more than 1,500 horses died at Valley Forge.

Not surprisingly, such drastic shortages of food and supplies—not to mention back wages—kept the men on the verge of mutiny, though somehow many persevered with wry good humor. Officers and men alike, however, indulged in brawling, drinking, and gambling. Hunger drove many marauding bands of soldiers into the surrounding countryside, prompting Washington to institute pun-

ishment for unauthorized absences and looting. Desertion among the men was rampant, and those caught routinely received 100 lashes as punishment, though two extreme cases resulted in hanging. The officers, who paid most of their own expenses while in the field, were also not immune to the lure of home and family and better conditions outside the army. They began resigning by the dozen in December, one division alone lost 50 of its leaders. Those not resigning requested furloughs in such numbers that Washington was compelled to reserve approval to himself for leaves of those above the rank of captain. Chronic absences among his senior staff forced much of the burden of command onto Washington alone.

Within the camp, problems of boredom and cleanliness needed to be addressed. Soldiers were put to work making cartridges and spittoons. Latrines were dug in the frozen turf, filled in, and dug again as necessary. Huts needed inspection for repairs, and dead horses and rotting garbage had to be buried. Although the worst of the sick cases were sent to hospitals in outlying areas, illness seriously depleted the ranks of men in camp. Exposure and overcrowding made colds endemic among the troops and often turned to pneumonia. Severe frostbite required amputation, with shock and infection the resultant dangers. Unsanitary conditions contributed to dysentery, typhoid, and typhus, as well as to the proliferation of lice and bedbugs. Cases of insanity were also noted among the men. Smallpox was a

major threat to the health of the army, and with the end of the campaign season, inoculation was ordered for those who had not already had the disease (see also DISEASE AND EPIDEMICS). Of the 4,000 men who were inoculated against smallpox throughout the winter, only 10 died.

The bleakness of the situation at Valley Forge was brightened, however, by the arrival of Baron FREDERICK VON STEUBEN, a Prussian army officer who volunteered his services to Washington and instituted a uniform system of drill. As various units were intermixed in the training process, a new sense of belonging to a truly Continental army developed, and the precision and skill the men acquired in the maneuvers on the field increased their morale and self-confidence. In February, MARTHA WASHINGTON arrived from Virginia and set to work organizing the officers' wives for darning, mending, and nursing duties, as well as overseeing various social activities. The onset of spring still found the army near starvation, and Washington organized foraging parties that particularly targeted LOYALIST sympathizers. The soldiers took all they could find, but most of the surrounding farms had already been picked clean by scavengers from both armies. The sense of desperation finally began to ease in March, when a herd of 500 cattle was expected at the end of the month, and in April as the shad began running in the Schuylkill, providing fish for immediate consumption and, once salted and preserved, for later use. The weather was variable but gradually progressed from warm to hot. When the Continental army left its winter encampment on June 19, 1778, the conditions were a far cry from those that had greeted its arrival. The attitude of the men had changed as well. No longer the starved, naked, ill-trained disparate force they had been six months earlier, the soldiers who emerged from Valley Forge were a confident, cohesive unit with a renewed commitment to the war effort.

**Vergennes, Charles Gravier, comte de** (1717–1787)  
*French diplomat*

An experienced diplomat, as French foreign minister (1774–87), Charles Gravier, comte de Vergennes was the architect behind France's support of the United States in the REVOLUTIONARY WAR (1775–87). Concerned with

both the humiliation suffered by France in the French and Indian War (1754–63) and the balance of power in Europe, Vergennes saw the North American rebellion as an opportunity to weaken Great Britain. His position was pragmatic, not ideological; if the British North American colonies became independent he believed Britain's commercial power would be crushed. In early 1776 he persuaded King Louis XVI to begin secret preparations for war and encouraged Spain to do the same. On May 2, 1776, the French government began clandestine financial aid to the United States, providing 1 million livres to buy arms and supplies. After the revolutionary victory at SARATOGA (October 17, 1777), Vergennes sought a greater commitment to the United States to prevent an accommodation between the colonists and the British. He had also waited until France had built up its navy so that it might challenge the British command of the sea. On February 8, 1778, he concluded two treaties with the United States: one for commerce and the other a military alliance. War broke out openly between France and Great Britain on June 17, 1778.

The support of Vergennes was crucial to the winning of independence by the United States. France provided money, supplies, armies, and a navy—all of which played a major role in the victory at YORKTOWN (October 19, 1781). France also helped to bring Spain into the war, although not as a direct ally of the United States. Despite the popularity of the war in France, it did not have the long-term effects Vergennes had hoped. The negotiators for the United States violated the terms of alliance with France and instructions from the SECOND CONTINENTAL CONGRESS by holding separate peace talks with Great Britain and gaining a highly favorable agreement in the TREATY OF PARIS (1783). Vergennes knew about these negotiations and even encouraged them. By 1782 France was on the brink of bankruptcy, and Vergennes wanted the war to end. But the French were committed to fight until Spain conquered Gibraltar. Vergennes believed that once Great Britain and the United States came to terms, Spain would have to follow suit and abandon its hopes for Gibraltar. Although the peace negotiations concluded as Vergennes expected after the Anglo-American agreement, France was still left with dire financial problems, which helped to precipitate the FRENCH REVOLUTION (1789–99). Great Britain, on the other hand, may have lost the jewel in its imperial crown, but it quickly recovered its commercial prowess and expanded its empire territorially elsewhere.

### Vice-Admiralty Courts

When the British Parliament decided to strengthen its imperial control over the colonies in the early 1760s, it turned to the use of Vice-Admiralty Courts to enforce customs regulations. Colonial Americans had developed customs evasion to a fine art. Customs officials had found that it was almost impossible to gain a conviction in a colonial court because the juries would be sympathetic to the accused customs evaders. Vice-Admiralty Courts were originally an arm of the Admiralty to determine lawful prizes during war, disputes between masters and seamen, and violations of the Acts of Trade. These courts did not use juries and would therefore be immune to local pressure. From the British perspective they were the perfect tool to guarantee that customs regulations would be followed. As a part of the SUGAR ACT (1764) a new Vice-Admiralty Court was established in Halifax. The act also permitted the customs officials to choose the court that they wished to prosecute the case and placed the burden of proof on the accused customs offender. The British expanded the Vice-Admiralty Court system in 1768 by creating Vice-Admiralty District Courts in Halifax, Boston, Philadelphia, and Charleston. Believing that trial by a jury of one's peers was the right of every Englishman, colonial Americans saw this measure as an effort to destroy their liberty.

### Virginia and Kentucky Resolutions (1798)

The Virginia and Kentucky Resolutions were passed in 1798 by the state legislatures of Virginia and Kentucky, protesting the ALIEN AND SEDITION ACTS (1798). The resolutions addressed STATES' RIGHTS, nullification, and the question of arbitration between the federal government and state governments. They recalled the themes of the AMERICAN REVOLUTION, arguing that tyranny and corruption were not necessarily imposed by external forces but could also develop internally, thus threatening a government from within.

JAMES MADISON secretly authored the Virginia Resolution. The Virginia legislature passed it on December 24, 1798. Madison argued that an individual state had the right to challenge any use of federal power it deemed unconstitutional. When the federal government exceeded its power

and broke the compact that formed government, Madison wrote that "the states, who are parties thereto, have the right and are in duty bound to interpose for arresting the progress of the evil."

The Kentucky state legislature passed two resolutions, each anonymously written by THOMAS JEFFERSON, then vice president of the United States. Jefferson could have been charged with violating the Sedition Act, making the need for secrecy all the more compelling. The first Kentucky Resolution, passed on November 16, 1798, said that each state "has an equal right to judge for itself" the validity of any federal activity that extended beyond the delegated powers. Echoing the rhetoric of the Revolution, Jefferson also argued that each state had the right to determine its own "measure of redress." The Kentucky legislature passed a second resolution on December 3, 1799, further sharpening the case for nullification. The Kentucky Resolutions presented the most aggressive argument for states' rights.

The Virginia and Kentucky Resolutions argued that the federal government should operate only with the consent of the individual states. The central government could not be trusted to police itself, Madison and Jefferson contended, so the states had a duty to restrict the federal government to its delegated powers. When passed along to the other states for approval, however, the Virginia and Kentucky Resolutions were for the most part dismissed. The arguments for nullification were resurrected by southern slaveholders during the sectional crisis leading to the Civil War. John C. Calhoun of South Carolina especially leaned on the words of Madison and Jefferson to support his justification of states' rights. Madison vigorously opposed Calhoun, claiming that his arguments were taken out of context. The Virginia and Kentucky Resolutions were a reaction to the Alien and Sedition Acts in particular, and they became an issue in the struggle between the FEDERALIST PARTY and DEMOCRATIC-REPUBLICANS.

### Virginia dynasty

Four of the first five presidents of the United States, for a total of eight of nine terms, came from the same state—Virginia. This early trend has been called the Virginia dynasty. At the time of the CONSTITUTIONAL CONVENTION, Virginia was the largest and most populous state. Excluding its claim to the Northwest Territories, Virginia comprised the present states of Virginia, West Virginia, and Kentucky. Perhaps equally important was the fact that Virginia had developed an articulate and outstanding group of leaders

drawn from the ranks of LAWYERS and slave-owning plantation holders. Given this leadership and the size and population of Virginia, it appeared only natural that the state would provide prominent national leaders.

Foremost among these men was GEORGE WASHINGTON, who, during the CONSTITUTIONAL CONVENTION in Philadelphia, was expected to become the first president. Washington chose to serve only two terms. His immediate successor was JOHN ADAMS from Massachusetts. Adams, however, served only one term and was defeated in the ELECTION OF 1800 by THOMAS JEFFERSON. While Jefferson had come to oppose many of the FEDERALIST PARTY policies of Washington and Adams, he had been Washington's first secretary of state and was a Virginian. His two terms were followed by his protégé, secretary of state and fellow Virginian JAMES MADISON. By this time, members of the Federalist Party were complaining that there ought to be a constitutional amendment against having two individuals from the same state elected in succession. Madison's political success led to the complete dominance of the DEMOCRATIC-REPUBLICAN PARTY and the election of James Monroe in 1816. Monroe was also from Virginia and had been Madison's secretary of state. The Virginia dynasty was finally broken by the election of John Quincy Adams in 1824.

### Virginia Resolves (1765)

At the instigation of PATRICK HENRY, the Virginia House of Burgesses—its lower house of assembly—passed a set of resolutions on May 30, 1765, declaring opposition to the STAMP ACT (1765). Henry was a relatively new member of the Burgesses, but he had already earned something of a reputation as a firebrand. He introduced the resolutions after the majority of members had left and as the Burgesses were about to adjourn; only 39 of 117 members were in attendance. While the resolves merely echoed the message of previous petitions against imperial regulation agreed to by the Virginia legislature, the language and tone

of these resolves was more intense. The first two resolves traced the rights of Virginians to the earliest settlements and the charters for colonial government issued by the kings of England. The next two resolves asserted that “the distinguishing Characteristick of *British* Freedom, without which the ancient Constitution cannot exist” is that taxation could be exacted only by “the People themselves, or by Persons chosen by themselves” and that the right to be governed and taxed by laws of their own choosing “hath been constantly recognized by the Kings and People of *Great Britain*.”

There remains some confusion over the exact process by which these resolutions were passed. On May 30, 1765, the Burgesses agreed to five resolutions. The next day it rescinded the fifth resolution, which declared that only the Virginia general assembly had the right to tax the colonies and that any challenge to this right “has a manifest Tendency to destroy British as well as American Freedom.” When newspapers throughout the colonies printed the Virginia Resolves, however, they included the fifth and one or two others. Historians are unsure how the newspapers obtained the sixth and seventh resolves. The additional resolutions were highly inflammatory, declaring that colonists “are not bound to yield Obedience” to any taxes other than passed by the colonial legislature, and that anyone speaking or writing that Parliament had the right to tax the colony would be deemed “AN ENEMY TO THIS HIS MAJESTY'S COLONY.” The seven resolves together had a tremendous impact on the other colonies, and when eight other colonial assemblies passed their own resolutions, they used the more provocative seven resolutions as a model.

**Warren, Joseph** (1741–1775) *physician, revolutionary*  
A spokesman in the RESISTANCE MOVEMENT (1764–75) to imperial regulation, Joseph Warren died at the beginning of the REVOLUTIONARY WAR (1775–83).

Warren was born in Roxbury, Massachusetts, in 1741. In 1755, the same year his father died, Warren entered Harvard College. After graduation, he apprenticed with Dr. James Lloyd and became an established physician. During a smallpox epidemic in Boston in 1763, the new doctor quickly became known as a successful inoculator (see also DISEASE AND EPIDEMICS). Indeed, Warren became friends with a patient named JOHN ADAMS as a result of the epidemic. By 1769 he had emerged as one of Boston's most celebrated physicians.

Warren also was active in politics, giving numerous speeches at Faneuil Hall alongside men like JOHN HANCOCK and SAMUEL ADAMS. In the aftermath of the BOSTON MASSACRE (March 5, 1770), Warren became a skilled propagandist, frequently urging military preparation. The BOSTON TEA PARTY (December 16, 1773) increased his standing in the Resistance Movement. In 1774 Warren led the committee that drafted the SUFFOLK RESOLVES. On April 18, 1775, Warren dispatched PAUL REVERE and William Dawes on their famous journeys. Warren served in three provincial congresses in Massachusetts, rising to president of the third.

On June 14, 1775, Warren was named a major general in the provincial army. Three days later, acting as a volunteer because his commission had not arrived, Warren was swept up in the BATTLE OF BUNKER HILL (June 17, 1775). Warren moved to hold Breed's Hill. Though resisting two waves of attack, Warren was caught in the third British charge. Among the last of the revolutionary forces left on Breed's Hill, Warren was shot in the head and killed.

**Warren, Mercy Otis** (1728–1814) *poet, playwright, historian, critic*

As a historian, poet and dramatist, Mercy Otis Warren provided both fascinating political commentary and a valuable insider's look at the events surrounding the AMERICAN REVOLUTION. Born in Barnstable, Massachusetts, in 1728, Mercy received little formal EDUCATION, except what she gleaned from her brothers' tutoring sessions. Mercy's brother, JAMES OTIS, was a leading political activist during the RESISTANCE MOVEMENT (1764–75), who publicly opposed various English measures, including the STAMP ACT (1765). Relationships to prominent revolutionary figures, such as James Warren, ABIGAIL ADAMS, and JOHN ADAMS, gave Mercy expert knowledge of the turbulent events surrounding the American Revolution, which she subsequently applied to her creative works.

On November 14, 1754, Mercy Otis married James Warren, a Massachusetts political leader, and the couple resided mainly in Plymouth, Massachusetts, except for the 10 years in which they lived in Milton at the house once owned by Governor THOMAS HUTCHINSON. They had five sons, compelling Warren to juggle motherhood with her writing career. Warren held strong views on women's roles in society. Although she believed in the importance of motherhood, she felt that women had the right to pursue other career interests. Women needed to manage their time wisely, thus allowing them to live in both the world of intellect and the world of domesticity. In letters she wrote to her friend Abigail Adams, Warren asserted that a good education proved critical to sharpening women's minds and distracting them from frivolous pursuits. She recognized that domestic responsibilities often hindered a woman's ability to challenge herself intellectually; however, it was worth the effort.

Warren applied her intellectual skills towards writing plays and recording the experiences of the revolutionary period. Her major works include *The Adulateur* (1773), *The Group* (1775), *Poems, Dramatic and Miscellaneous*

(1790), and *A History of the Rise, Progress, and Termination of the American Revolution* (3 volumes, 1805). In the political satires *The Adulateur* and *The Group*, Warren directed her attacks at the increasingly unpopular governor Thomas Hutchinson. She also predicted that a war against Great Britain would inevitably occur. The playwright maintained strong republican convictions and criticized those who exhibited “aristocratic” tendencies. Through personal correspondence, Warren offered her opinions on political matters to a number of major political figures, including John Adams, SAMUEL ADAMS, James Winthrop, JOHN DICKINSON, THOMAS JEFFERSON, GEORGE WASHINGTON, ELBRIDGE GERRY, and HENRY KNOX.

In her history of the Revolution, few people escaped Warren’s biting political commentary, including the second president of the United States, John Adams. For example, Warren questioned Adam’s ability to keep his passions and prejudices intact, and she noted his excessive “pride of talents” and ambition. Adams objected to Warren’s depiction of him, and consequently, a rift developed in their friendship that lasted for almost five years. Mercy Otis Warren’s influence waned as a new generation of politicians came into power in the early 19th century. However, through her literary contribution, her imprint on the Revolution remains firm. She died in Plymouth, Massachusetts, on October 19, 1814.

## Washington, District of Columbia

Washington, D.C., is a planned national capital and one of the few founded solely for the purpose of government. Established in 1791 as the District of Columbia, Washington became the seat of power as the result of the “dinner table bargain” between JAMES MADISON and ALEXANDER HAMILTON, whereby Madison agreed to support the assumption of state debts in exchange for locating the capital on the Potomac River. THOMAS JEFFERSON, who reported that he brokered this deal, said later that he regretted the bargain since it helped solidify the hold by the FEDERALIST PARTY on the national government in the 1790s. The actual site was chosen by GEORGE WASHINGTON, and it comprised land near Mount Vernon in both Virginia and Maryland. (In 1846 Congress ceded the Virginia portion of the District of Columbia—Alexandria—back to Virginia.) In the early 1800s, the area selected was swampy, hot, and largely undeveloped. When President JOHN ADAMS moved to the city in 1800, and when Jefferson became the first president inaugurated there, the “republican city” remained half-built and insignificant.

The city plan reflected the order and balance of the Enlightenment run amuck. The Frenchman PIERRE-CHARLES L’ENFANT designed the city in the 1790s. He used a grid with four unequal quadrants overlapped by avenues that meet at different angles, creating a series of strange

The White House as it appeared in 1807 (Library of Congress)

intersections that often open into traffic circles. L'Enfant's ambitious plans were beyond the resources available. He had envisioned a city built around grand buildings for each of the three branches of government. However, only the capitol, housing the legislative branch, and the executive mansion were built. A separate building for the SUPREME COURT would not be constructed until the 20th century. For most of the first half of the 19th century, Washington would have a half-finished look.

L'Enfant's extravagance created difficulties, and the government had to dismiss him as the city's architect. Efforts to raise money by selling city lots inevitably fell short—those few people who invested in city real estate seldom gained a profit and often went bankrupt. Moreover, the penny-pinching policies of the DEMOCRATIC-REPUBLICAN PARTY limited the amount of money the government was willing to put into the city. Although the British capture of Washington (August 24–25, 1814) and the burning of many of the public buildings was an embarrassment during the War of 1812 (1812–15), the capital was so insignificant as a population or business center that its destruction had little real impact on the war effort.

The grand city today, with its many public buildings, museums, and monuments, is a product of developments in the 20th century.

**Further reading:** James Sterling Young, *The Washington Community, 1800–1828* (New York: Columbia University Press, 1966).

**Washington, George** (1732–1799) *first U.S. president* No one looms larger in the pantheon of national heroes than George Washington, whose service in the REVOLUTIONARY WAR (1775–83) and as the first president of the United States earned him adulation bordering on worship from contemporaries and future generations alike. ABIGAIL ADAMS said Washington was made of “majestick fabric,” and upon his death in 1799 the House of Representatives proclaimed him “first in war, first in peace, and first in the hearts of his countrymen.” Americans have named the national capital, an imposing monument, and a state in his honor, while towns such as Stoughtonham Township in Massachusetts paid their respects by changing their name to Washington as well. They did so as early as 1776, while Washington was alive and the outcome of the Revolutionary War remained uncertain. Families rushed to name their children after him years before and long after he became president.

The larger-than-life image of Washington as father of his country has made his more human side difficult to understand. The first president seems cold and aloof to our skeptical age, and we look past his imposing visage

on the one dollar bill for cracks in his Olympian legend. Our collective cynicism is fueled by the knowledge that writers such as MASON LOCKE WEEMS fabricated stories about Washington, including the famous (and completely fictional) account in which a young Washington confesses his role in destroying a family cherry tree by proclaiming to his father, “I can’t tell a lie Pa; you know I can’t tell a lie. I did cut it with my hatchet.” Similar myths remain prevalent even today, and they combine with facts regarding Washington’s virtues to create a portrait of a man so seemingly great that few people today can relate to him. This is unfortunate, for the real Washington was both more and less heroic than his legend suggests.

He was born on February 22, 1732, at Wakefield, a country home in Westmoreland County, Virginia, near the Potomac River. His father Augustine was a successful farmer and land speculator, and he trained George in the ways of a Virginia planter prior to his death in 1743. Washington learned to ride and shoot, traveled with his father on business, and developed a strong ambition to become a wealthy and successful landowner in his own right. One of seven children, and the oldest son of Augustine’s second marriage, Washington became a land surveyor in 1749 after his mother blocked his plan to join the Royal Navy. He surveyed much of Virginia’s vast western land claims until he inherited Mount Vernon following the death of his brother Lawrence in 1752. Thereafter he lived as a country gentleman.

Yet financial success as a planter could not satisfy Washington’s desire for renown, and he joined the Virginia militia as a lieutenant colonel in 1754 in the hope of finding fame on the battlefield. His actions on the FRONTIER helped to bring on the French and Indian War (1754–63). At the head of a small group of Virginians and Indians, Washington beat a smaller French force in what is now western Pennsylvania on May 28, 1754. He then watched helpless as his Indian allies butchered a French officer and the surviving French soldiers. Washington also had his men build Fort Necessity in the same area, in an almost indefensible position, and had to surrender the outpost to the French after a brief siege on July 3–4, 1754. This debacle marked the opening round of the French and Indian War and clouded Washington’s reputation. He subsequently left the militia rather than accept a demotion in rank. Yet Washington quickly sought to redeem himself, volunteering to accompany a British army led by General Edward Braddock in an attack on the French and NATIVE AMERICANS west of the Appalachians. This expedition suffered ambush and virtual annihilation (July 9, 1755), but Washington fought bravely and had two horses shot out from under him. He emerged from the battle a hero, and Virginia governor Robert Dinwiddie rewarded him with promotion to full colonel and command of the Virginia regiment.

George Washington. Painting by Charles Willson Peale (*West Point Museum Collections, United States Military Academy*)

Washington fought in the ensuing war for 40 frustrating months, pleading for reinforcements and gradually losing one-third of his men. He failed in attempts to gain a commission in the British army, but he accompanied a column commanded by General John Forbes, which finally captured Fort Duquesne in 1758. With the French threat to Virginia's western frontier eliminated, Washington retired from the militia and married a fabulously wealthy widow named Martha Custis (see also *MARTHA WASHINGTON*), who owned hundreds of slaves and almost 18,000 acres of land. By 1759 Martha and George were among the most celebrated families in Virginia.

They embraced a comfortable life during the 1760s, hosting countless parties and successfully winning a seat for George in the House of Burgesses. Washington excelled as a horseman and dancer, and he loved wearing fine clothes. He also worked hard as a land speculator and wheat farmer.

While expanding Mount Vernon he devoted himself to his two stepchildren, John and Martha, and served as a justice of the peace even as he acquired more than 20,000 acres of land near the Great Kanawha River as a reward for his war service. Critics accused him of impropriety for scheming to have the House of Burgesses name a good friend surveyor of the land and for buying territory at low prices from other veterans. In 1772 Washington commissioned CHARLES WILLSON PEALE to paint his portrait and characteristically posed for the painting wearing his militia uniform. Whatever his financial successes, he wanted to be remembered as a soldier.

Washington grew increasingly frustrated with British policy in North America, which blocked westward expansion and prevented him from selling his lucrative western land to settlers. He also believed that the Crown was denying colonial Americans their rights as Englishmen, and he supported the RESISTANCE MOVEMENT (1764–75), serving as a delegate to both the FIRST and the SECOND CONTINENTAL CONGRESS. After war began at the BATTLES OF LEXINGTON AND CONCORD (April 19, 1775), he wore his militia uniform to meetings as a not-so-subtle reminder that he deserved command of the new CONTINENTAL ARMY, and when JOHN ADAMS nominated him for the post his peers quickly assented. They recognized his military experience, dignified bearing, sense of command, and his reputation as a man of character and high principles. Moreover, as a Virginian, his role as a commander of troops in New England, where the war began, would help bind his colony to the rebellion.

Washington assumed command of the revolutionary army in June, and he surrounded Boston with thousands of eager recruits. However, the British retained possession of Boston until the spring of 1776. Washington ended the stalemate by ordering his troops to seize DORCHESTER HEIGHTS (March 4–5, 1776), compelling the British to evacuate Boston on March 17. In August the British landed an army of 34,000 men commanded by General WILLIAM HOWE near New York City. In a series of contests, beginning with the BATTLE OF LONG ISLAND (August 27–30, 1776), Howe battered Washington's army time and again. Jeering British troops blew fox horns while pursuing the broken Continental army, and only Howe's tentative advance, the intervention of bad weather, and the onset of winter saved the revolutionary forces from outright destruction. Washington's inexperience as a field commander led to most of the defeats. In his defense, he learned his lessons well. Washington thereafter avoided risking his entire army in a general engagement, adopting instead a cautious Fabian approach to warfare designed to keep his army intact.

After the string of defeats, Washington faced a crisis toward the end of December. With many enlistments expir-

ing, he was afraid he would not be able to gain new recruits without some positive action by the army. Washington therefore took a chance and launched a foolhardy attack in a snowstorm against an outpost of HESSIANS at Trenton on December 26, 1776. Amazingly, he surprised the garrison. Then, a few days later, when he found himself cornered between the Delaware River and a superior British army under CHARLES, LORD CORNWALLIS, he slipped his troops to the side and won another victory against a smaller force at Princeton on January 3, 1777 (see also BATTLES OF TRENTON AND PRINCETON).

Although Washington did not win many battles during the war, he continued to exhibit an incredible sense of leadership. He managed to keep an army together during the winter of 1776–77 at MORRISTOWN, New Jersey, but that next spring faced defeat again and was compelled to give up Philadelphia to the British. The winter of 1777–78 was spent building the army at VALLEY FORGE. When the British evacuated Philadelphia in June 1778, Washington followed, fighting a battle at the BATTLE OF MONMOUTH (June 28, 1778) and then stationing his army around New York City for most of the rest of the war. In eight and a half years in the field he slept only three nights at Mount Vernon. He also refused a salary and supported civilian rule over his army, even when Congress seemed to have forgotten about his starving and ill-equipped men. Washington confronted mutinies among his troops and conspiracies among his officers to have him replaced. He also struggled with chronic shortages of men and supplies. But he never abandoned hope.

In 1781 Washington made the most brilliant decision of the war when he marched his army south from New York to join combined French and Continental forces besieging a British army commanded by General Cornwallis at YORKTOWN, Virginia. When a French fleet blocked Cornwallis's seaward escape a great victory was assured, and the British surrendered on October 19th. Triumph at Yorktown led to the end of the war and the signing of the TREATY OF PARIS (1783), which recognized the independence of the United States. After the British evacuated New York City in November 1783, Washington stunned the world by resigning his commission and returning to Mount Vernon.

His resignation became the most admired act of his life, for it demonstrated civic virtue and an unselfish sense of duty that awed his generation. Washington knew the way in which his resignation would be received, and he acted in large measure to enhance his reputation. Yet he could have been a king or a dictator in North America and used the army for his own ends, or he might have demanded vast rewards for his service to his country. Instead, he went home and expected to live the remainder of his days at Mount Vernon as a modern-day Cincinnatus. (A general in

ancient Rome who returned to his farm after winning a war and saving the Roman Republic.)

To his dismay, Washington found that his fame precluded isolation from public life. He emerged from retirement to preside over the CONSTITUTIONAL CONVENTION in 1787, and he then served two terms as the first president of the United States, 1789–97. In each case he left Mount Vernon reluctantly, wary of damaging his reputation through association with political endeavors that might have failed, and in each case his role proved vital. His prestige gave credibility to the Constitutional Convention, and it is difficult to imagine the delegates reaching any sort of consensus without his leadership. Moreover, many of them approved the strong, centralized powers of the new federal government only because they believed Washington would be the first president, and that only he could be trusted not to abuse those powers. Washington acceded to popular pressure and became the first president of the United States in April 1789.

As president he oversaw the creation of the federal government, sided with ALEXANDER HAMILTON in disputes over the UNITED STATES CONSTITUTION, and noted with dismay the increasing factionalism of his countrymen. He wanted to retire following his first term, but he was persuaded to stay by supporters and was unanimously reelected. Washington crushed the WHISKEY REBELLION in 1794, kept the United States neutral after the outbreak of the FRENCH REVOLUTION (1789–99) and the ensuing wars between the French and the British, and sent an army led by ANTHONY WAYNE to defeat NATIVE AMERICANS in the Ohio River valley in 1794.

He declined a third term in office in 1796, peacefully transferred power to his successor, John Adams, in 1797, and established the tradition that no president should serve more than two terms. In his FAREWELL ADDRESS he urged the nation to avoid permanent alliances with foreign countries and warned against the development of POLITICAL PARTIES. He died two years later on December 14, 1799.

Washington left behind a compelling record of military and political achievement. He almost single-handedly held the Continental army together for eight years, battling the British, mutinies, conspiracies, and supply shortages that would have broken more ordinary leaders. He was not a great field commander, but he learned from his mistakes and bided his time until conditions were ripe for the master stroke at Yorktown. Politically, he proved remarkably astute at discerning the will of Congress and at creating an image of himself that strongly appealed to his generation. Less politically experienced and intellectually gifted than founders such as THOMAS JEFFERSON or John Adams, he retained a sense of pragmatism and virtue as president that encouraged popular faith in the government and kept the

United States out of war in the early years of the republic. Most important, he oversaw the creation of the Constitution, which provided a foundation on which a new form of government could be built.

As a human being, Washington's legacy is more complex. He treated his slaves harshly yet provided for their emancipation following his death. (However, they were to be freed only with Martha's consent or after she died. Wisely, she freed his slaves, but not the ones that had belonged to her estate, before her own death.) He proved a loving husband and stepfather, yet nurtured an abiding affection for Sally Fairfax, the wife of a good friend, for almost all of his life. He was vain, hot-tempered, and ambitious, but he balanced these qualities with a zealous self-discipline that made him a model of civil and gentlemanly behavior. Less educated than any of the galaxy of great minds that crowd the revolutionary era, he earned the universal admiration of his peers through force of will and devotion to principle. And though popular to the point of deification in many parts of the country, he struggled to maintain a relationship with his Loyalist mother, who opposed the Revolution all of her life.

What all this effort—24 years that followed his nomination to command the Continental army in 1775—cost him can never be known. If his popular epitaph as the “Father of His Country” is well deserved, so, too, is the one he unwittingly wrote for himself in a letter to the MARQUIS DE LAFAYETTE in 1784. Faced with old age and the prospect of death, Washington said, he would not repine, for “I have had my day.”

### Washington, Martha (1731–1802) *first lady*

Martha Dandridge Custis Washington was the wife of GEORGE WASHINGTON, the first president of the United States and commander in chief of the CONTINENTAL ARMY during the REVOLUTIONARY WAR (1775–83). Although she had no role model to follow, Martha diligently and gra-

ciously served her country in her capacity as First Lady. Embracing her domestic responsibilities, she proved to be a dutiful wife and attentive mother to both her children and her grandchildren.

Martha Dandridge was born at Chestnut Grove in New Kent County, Virginia, on June 2, 1731. She received a traditional EDUCATION for young women in the 18th century, which emphasized such domestic skills as sewing, housekeeping, cooking, as well as reading, writing, dance, and MUSIC. At the age of 18, Martha married Daniel Parke Custis, a wealthy plantation owner who was 20 years her senior. The couple had four children, although two died in infancy. In 1757 Custis died, leaving Martha with a substantial estate and two small children, John Parke (Jacky) and Martha (Patsy).

On January 6, 1759, after a short courtship, Martha married George Washington, a young colonel in the Virginia militia, who had served in the French and Indian War (1754–63). The couple and Martha's two small children moved to Washington's plantation, Mount Vernon, in April 1759. Although Mount Vernon remained the Washington's family home, future events dictated that the couple spend a number of years living elsewhere. During the Revolutionary War, Martha joined her husband at VALLEY FORGE (1777–78). She also joined him on some of his later campaigns, including in New Jersey, New York, and Pennsylvania, living simply and doing all she could to support the war effort. When her last surviving son, John Parke, died of “camp fever” in 1781, Martha and George adopted his two youngest children, Eleanor Parke Custis (Nelly) and George Washington Parke Custis (Wash or Tub).

After the inauguration of her husband as president on April 30, 1789, Martha and her grandchildren uprooted themselves from their home in Mount Vernon and moved to New York, then the national capital. Shortly thereafter, the family moved to the new capital in Philadelphia, until the end of George's presidency. While in Philadelphia, Martha, or “Lady Washington” as she came to be known, diligently performed her duties as a hostess for the weekly receptions held by the first couple. Although cast in a very public role, Martha confided to friends her preference for a more private life. She gladly returned home to Mount Vernon with her family on March 15, 1797, after the completion of George's second term. The couple enjoyed two short years surrounded by their loved ones at Mount Vernon before George's death in 1799. Martha burned all but two of the letters written between the couple over the course of their courtship and marriage, again reaffirming her desire for privacy. Martha Dandridge Custis Washington died on May 22, 1802, in the presence of her beloved granddaughter Nelly. Fittingly, she was buried next to her husband at Mount Vernon in a family tomb.

### Washington Benevolent Societies

Members of the second generation of the FEDERALIST PARTY founded Washington Benevolent Societies in an effort to revive their party's flagging political fortunes during the first decades of the 19th century. Although older party leaders instinctively mistrusted grassroots politics, young members of the Federalist Party believed that such efforts were the only way to sustain their cause. Thus, the Washington Benevolent Societies epitomized belated Federalist Party efforts to adapt to the changing political culture of the early republic and embrace popular politics. The first society appeared shortly after GEORGE WASHINGTON's death in 1799 and, although most societies disappeared by 1824, the Philadelphia society remained active through the 1830s.

The first society, named the Washington Society of Alexandria, began as an effort to honor George Washington. Founded in January 1800 by a group of Washington's friends and acquaintances, the society pledged to support charities that Washington favored as well as sponsoring celebrations on Washington's birthday, February 22. Membership was by invitation only, and dues were prohibitively high so as to restrict who joined. Unlike its successors, the Alexandria group did not have an explicitly political agenda.

President THOMAS JEFFERSON'S EMBARGO OF 1807 hastened the creation of other Washington Societies. In 1808 Young Federalist Party supporters founded societies in Philadelphia, New York, Boston, and elsewhere, eventually leading to more than 200 such organizations. The New York group was the first to call itself the Washington Benevolent Society. Like the original Alexandria society, these societies engaged in charitable activities although the extent and commitment varied widely from society to society. These activities included direct grants to the needy, employment training, legal advice, firewood, clothing, and support for free schools. Charitable activities, however, were secondary to politics.

In contrast to the Alexandria club, these newer groups opened their membership, with some qualification, to all voters. The societies still required annual dues, but these dues were nominal, and the president could waive them based on need. Members were required to be citizens, have good moral character, and be firmly attached to the UNITED STATES CONSTITUTION. In practice, these requirements meant that members had to support the Federalist Party.

The societies' political activities fell into two categories. The societies served as auxiliaries to the local Federal-

ist Party, and in areas where there was no local committee, societies performed the responsibilities of nominating candidates and conducting campaigns. In addition, societies sponsored celebrations, orations, and parades on Washington's birthday, July 4, and the anniversary of Washington's first inauguration.

With the irreversible decline of the Federalist Party after the Hartford Convention and the Treaty of Ghent in 1814, Washington Benevolent Societies also lost their relevance. No additional societies were founded, and eventually the others faded away.

### Wayne, Anthony (1745–1796) *army officer*

Nicknamed “Mad Anthony” because of his rash decisions in battle, Anthony Wayne was born in 1745 in Pennsylvania into a prosperous farming family. On March 25, 1766, Wayne married Mary Penrose, the daughter of a Pennsylvania merchant.

Wayne entered public life in 1774, when he was elected to the provincial convention to discuss the COERCIVE ACTS (1774). In 1776 the Pennsylvania Committee of Safety nominated Wayne to serve as a colonel in the CONTINENTAL ARMY and later that year he assumed command of FORT TICONDEROGA. Wayne disliked his time at Fort Ticonderoga but impressed higher officials with his discipline, orderliness, and military successes in CANADA. In 1777 Wayne was promoted to brigadier general. Wayne suffered a disastrous defeat at the hands of the British army at the Battle of Paoli (September 21, 1777). General WILLIAM HOWE's army killed 200 and injured 100 more colonial troops under Wayne during the Paoli “massacre.” A court-martial investigating the affair acquitted Wayne of any misconduct. Wayne gained his greatest success at the BATTLE OF STONEY POINT (July 16, 1779), when he led his men up a steep cliff in the Hudson Highlands and surprised and overwhelmed the British garrison. In 1781 GEORGE WASHINGTON ordered Wayne to accompany the MARQUIS DE LAFAYETTE to Virginia. He enjoyed successful campaigns in Virginia and Georgia until the REVOLUTIONARY WAR (1775–83) ended.

After the war, Wayne entered private life. Sickness weakened his constitution, and along with many slaves that he acquired during the war he devoted time to the rice plantation in Georgia. His plantation endeavor failed, and Wayne returned to Pennsylvania, where he was elected

to the House of Representatives. His political career was short-lived, but he used his time to expand the military and pressed for settler claims against NATIVE AMERICANS in the South. In 1792 President George Washington appointed Wayne commander of the Legion of the United States. The United States had experienced problems with Native Americans in the Old Northwest since the conclusion of the Revolutionary War. Many Indians in the Ohio River valley did not recognize land cessions that occurred after the Revolutionary War and actively resisted European Americans settling on the FRONTIER. Federal efforts to quell resistance failed. In 1790 a pan-Indian army (mostly Miami and Shawnee) ambushed Josiah Harmer's army, and in 1791 another pan-Indian army routed ARTHUR ST. CLAIR on the Wabash River.

Battling health problems, Wayne instilled discipline into his legion and prepared to move against the Native Americans in the Old Northwest in 1793. However, it was not until 1794 that Wayne could strike a decisive blow. Wayne led an army of about 3,000 troops that defeated Miami Little Turtle's pan-Indian army at the BATTLE OF FALLEN TIMBERS (August 20, 1794). To assure peace between U.S. settlers and Native Americans, Wayne presided over the TREATY OF GREENVILLE (1795) that ceded the southeast half of the present-day state of Ohio to the United States and established two forts to prevent Indian and settlers from attacking each other. Wayne did not live long after his military successes in the Old Northwest. He died on December 15, 1796, at Fort Presque Isle (present-day Erie, Pennsylvania).

**Webster, Noah** (1758–1843) *lexicographer, educator, publisher*

Long a proponent of a national culture, Noah Webster standardized a distinctly American form of the English language. In his spellers, readers, and grammar books, Webster provided a more uniform means of spelling, pronunciation, and writing. In books such as *The American Spelling Book* (1831) and *An American Selection of Lessons in Reading and Speaking* (1804), Webster evoked a strong nationalism. In addition to authoring *An American Dictionary of the English Language* (1828), Webster also assisted in the founding of Massachusetts's Amherst College. Like many of his generation, Webster looked upon the masses as crude and potentially destructive. He considered religious

and educational training essential to the formation of a virtuous and moral citizenry.

Born in West Hartford, Connecticut, Noah Webster showed an early proclivity for higher learning. After graduating from Yale College in 1778, he worked as both a teacher and clerk before beginning a short career in law. Webster published *Speller*, the first part of his *A Grammatical Institute of the English Language*, in 1783 and followed it with a grammar and reader over the course of the next two years. Aimed at an elementary audience, his speller proved a surprising success. By the end of the 1830s, some 15 million copies were in print. The goal of these and later works was nothing short of establishing a national linguistic standard.

An ardent supporter of a strong central government and advocate for the ratification of the Constitution, Webster also invested tremendous time, energy, and money into securing copyright legislation. To do so, he traveled throughout the country, visiting the state capitals and forming close connections with political leaders from South Carolina to Connecticut. He counted BENJAMIN FRANKLIN an ally in his effort to formalize and simplify English spelling. Despite the fact that few of his spelling reforms took hold, Webster did make a lasting impression in the realm of orthography.

Webster married Rebecca Greenleaf on October 26, 1789, and soon moved to New York to begin work as an editor for two FEDERALIST PARTY newspapers, the *Minerva* and the *Herald*. Ten years passed before he and his family relocated to New Haven. The political climate changed, however, as the Federalist Party was defeated by THOMAS JEFFERSON in 1800. Already alienated by political divisiveness, Webster left his newspaper editorship in 1803.

Webster then returned to a life devoted to learning. He published works on reading, epidemics (see also DISEASE AND EPIDEMICS), economics, and SCIENCE throughout the latter years of his life. His lexicographical triumph came with the 1806 publication of *A Compendious Dictionary of the English Language*. In this short volume, Webster recorded words that had yet to be incorporated into other dictionaries. During the next 20 years, he continued to build on this work, publishing the stunning *An American Dictionary of the English Language* in 1828. Webster's dictionary incorporated words from both LITERATURE and everyday speech, provided primary as well as secondary and tertiary definitions, and included etymologies. In retrospect, many of his definitions were flawed, and his etymologies lagged behind the work of more advanced linguists. Nonetheless, Webster gained renown both within and outside the United States through his many publications and particularly his dictionaries.

—Daniel M. Cobb

**Weems, "Parson" Mason Locke** (1759–1825)  
*biographer*

Mason Locke Weems was a minister, book agent, traveling salesman, and author. He was born near Herring Bay, Anne Arundel County, Maryland, in 1759, and little is known about his childhood. It is believed that around the age of 14 he traveled abroad for an EDUCATION in London and at the University of Edinburgh. With the onset of the REVOLUTIONARY WAR (1775–83), Weems returned to Maryland. There is some evidence that he and his brother became blockade-runners to supply the revolutionary effort during the war, but this is not firmly established.

Weems's life after the war is better documented. He studied theology, hoping eventually to be ordained into the ministry. He initially encountered difficulty in securing ordination in the ANGLICAN CHURCH, but once Parliament relaxed the allegiance requirements for ordination, Weems was able to enter the ministry in 1784. He served for seven years as rector in Anne Arundel County.

Parson Weems soon began moving beyond the confined life of a parish and entered the wider world of writing, publishing, and bookselling. By 1792 Weems had become a traveling bookseller for publisher MATHEW CAREY of Philadelphia. He continued selling books and Bibles for three decades, bringing the written word to cities and farm communities along the Atlantic seaboard. Weems also began to write his own stories. In 1800 he wrote and published his most influential work, a biography of GEORGE WASHINGTON, which included the fabricated cherry tree story. Since Weems occasionally preached at the Pohick Church, he could advertise himself as Parson Weems, "Formerly Rector of Mt. Vernon Parish," thus lending an air of credibility to his book. *The Life of Washington* is hardly an objective biography of Washington. On the contrary, it is a fictionalized tale of heroism, portraying Washington as just a regular buckskin and an average man who, Moses-like, was sent from God to deliver his people from the bondage of the British Empire. Weems's "biography" was widely successful, achieving publication in more than 70 editions and in a variety of languages. The book told the story of the Revolutionary War in an exciting, dramatic, and personal way that appealed to readers of all ages.

Weems wrote several other books about "heroes of the revolutionary and colonial past," including books

about BENJAMIN FRANKLIN, General FRANCIS MARION, and William Penn. His Franklin biography even outsold the "lightning tamer's" own autobiography. Weems saw himself on a mission—bringing inexpensive knowledge to the masses. As he explained to Carey, "I deem it a great glory to circulate valuable books. I would circulate millions. This cannot be effected without the character of cheapness."

Although money was important to Weems, the moral component of his work was also crucial. He penned one of the first TEMPERANCE books published in the United States, *The Drunkard's Looking Glass: Reflecting a Faithful Likeness of the Drunkard* (1812). He turned his attention to other sins as well, including *God's Revenge Against Murder* (ca. 1807), *God's Revenge Against Gambling* (ca. 1810), *God's Revenge Against Adultery* (1815), *God's Revenge Against Dueling* (1820), and *The Bad Wife's Looking Glass* (1823).

These books sold and appealed to a certain audience, though none reached the success of the Washington biography. Weems died in Beaufort, South Carolina, in 1825. His version of the Revolutionary War lived on, shaping the myths and collective memory of countless readers.

**Further reading:** Lewis Leary, *The Book-Peddling Parson* (Chapel Hill: University of North Carolina Press, 1984).

**West, Benjamin** (1738–1820) *portrait and history painter*

Beginning as a provincial artist in British North America, Benjamin West ended up as the court painter of King GEORGE III and president of the Royal Academy in London. Along the way he completed more than 700 paintings and his London studio became the center of influence and training for the generation of aspiring American artists in the revolutionary era who returned to the new nation; West, however, remained in Europe.

West was born in 1738 in the Quaker community of Springfield, Pennsylvania, outside Philadelphia. His training came from a series of the European and American itinerant artists who traveled through the colonies painting portraits of the local gentry. West's early work in portraiture drew upon English mezzotints for models; he also expanded into history paintings and landscapes. Several significant Pennsylvanians provided patronage to the young artist. One, the Reverend William Smith, provost of the University of Pennsylvania, made possible a trip to Italy to study the Old Masters and immerse himself in the contemporary European art world. These European travels to Italy, France, and eventually Great Britain took West to London in 1763, where exhibitions of his work brought him notice and success. His fiancée Elizabeth Shewell

joined him there along with her cousin Matthew Pratt, who became the first of West's pupils from North America. West would correspond with JOHN SINGLETON COPLEY and welcomed to his studio CHARLES WILLSON PEALE, GILBERT STUART, RALPH EARLE, JOHN TRUMBULL, and Washington Allston.

Increasingly, West turned toward history paintings after the 1760s. He used neoclassical style and topics from Roman antiquity for his works such as *Agrippina Landing at Brundisium with the Ashes of Gemanicus* (1768, Yale University Art Gallery). This painting brought West his first commission from George III of an eventual 60 portraits and history paintings for the British monarch along with an ambitious and uncompleted project to decorate the royal chapel at Windsor with religious paintings. By 1780 West was receiving a royal stipend of £1,000 a year and took for himself the title of "Historical Painter to the King of England."

## West Indies

The term "West Indies" refers to the region of the Caribbean Sea. The islands of the West Indies exerted an important influence on North Americans in the colonial, revolutionary, and early republican eras. The West Indies and North America were tied through TRADE, shared the institution of SLAVERY, and were politically and diplomatically interconnected.

During the colonial period, from the British perspective, the West Indies colonies of Jamaica and Barbados were their most important colonies in the Americas. Great profits could be earned from plantations growing sugar on these islands. The North American colonists fit into this equation as suppliers of food and carriers of slaves from Africa. Not content with this role for the British colonies, colonial North Americans also engaged in illicit trade with the French, Dutch, and Spanish of the region. It was in response to this trade that Great Britain began to tighten imperial regulations in the 1760s and passed the SUGAR ACT (1764). After the REVOLUTIONARY WAR (1775–83), much of the West Indies trade was closed to the United States. The Anglo-French Wars after 1793 helped to rein-vigorate West Indies trade, especially with the French

colonies. The revolutions in the Spanish colonies following the Anglo-French Wars also increased trade with the region, although contact with the British colonies remained restricted.

Throughout this period, slavery tied North America and the West Indies together. Most colonies in the Caribbean had a more extensively developed plantation economy than in what became the mainland colonies. But there were many similarities between slavery in the two areas, especially in coastal South Carolina and tidewater Virginia, both densely populated with slaves. Elsewhere, merchant connections, slave traders, and even the slaves themselves (many of whom had Caribbean roots) had direct personal knowledge of the West Indies slave system. During the 1790s and early 1800s the great slave revolt in the French colony of Saint Domingue (HAITI), had a searing impact on North American slaveholders, suggesting to them their own fate if they did not fully control their chattel workers. In turn, the movement to free slaves in some parts of the United States had an influence on slaves throughout the West Indies.

The West Indies were often the centerpiece for contests over empire. During the French and Indian War (1754–63), the British were as much concerned with controlling the West Indies as North America. During the peace negotiation, France gave up CANADA so that it could retain possessions in the Caribbean.

The West Indies were also an import locus of action during the Revolutionary War. Although the British colonists in the West Indies shared some of the same grievances as their North American cousins, they generally opposed the resistance that broke into revolution in 1775. Many plantation owners had strong connections to Great Britain, with several having seats in Parliament, and therefore opposed independence. Moreover, the island colonies were more dependant on Great Britain for protection from other nations and from the overwhelming majority of black slaves in their midst. Thus, although there were some revolutionary sympathizers in the islands, they generally became bastions for LOYALISTS. Moreover, during the war, the naval control of the region was vital to both the French and the British. Once France entered the war in 1778, the British focused as much on protecting their possessions in the West Indies as fighting the war in North America. It was the arrival of a French fleet from the West Indies that set up the victory at YORKTOWN (October 19, 1781). Moreover, the French disaster at the BATTLE OF THE SAINTES (April 12, 1782)—a naval engagement fought in the straits between Dominica and Guadeloupe—helped to bring both Great Britain and France to the peace table to end the conflict.

During the 1790s and early 1800s the West Indies became the locus of much of the conflict over neutral

rights, as British and French navies seized merchant ships from the United States. The profitable carrying trade was mainly between French and British colonies in the West Indies and Europe. The QUASI-WAR (1798–1800) was largely fought in the West Indies. French failure to regain control of Saint Domingue in 1803 convinced NAPOLEON BONAPARTE to sell the LOUISIANA PURCHASE (1803).

## West Point

West Point, New York, is where the United States Military Academy was established in 1802. This former fort is located at a curve in the Hudson River that was the most defensible point in the Hudson Highlands. Built during the REVOLUTIONARY WAR (1775–83), with Tadeusz Kościuszko putting his military engineering skills into play, this New York fort became the strategic base connecting New England with the rest of the states. BENEDICT ARNOLD, the commander of West Point, plotted to surrender the fortifications to the British but was foiled in his treason by the capture of Major JOHN ANDRÉ. After the war the United States government maintained an outpost at West Point, purchasing the land in the 1790s.

A military academy had been a dream of GEORGE WASHINGTON and the FEDERALIST PARTY, but they never successfully put one into place. However, the academy was finally established under the administration of THOMAS JEFFERSON. Unlike the Federalist Party, Jefferson and the DEMOCRATIC-REPUBLICAN PARTY did not see the academy as the training ground for the children of the well-born. Instead, they viewed it as a republican institution, and Jefferson insisted that West Point be open to the sons of all citizens. His hope was to replace the Federalist Party–dominated officer corps, where appointments had often been based on personal connections, with a more republican officer corps, where talent and ability would be crucial. For Jefferson, establishing a military academy became another way for him to counter what he saw as the aristocratic pretensions of the Federalist Party.

## Whately, Thomas (d. 1772) government official

Although a minor official in Great Britain, Thomas Whately played a significant role in the developing imperial crisis of the 1760s and 1770s. As a secretary for GEORGE GRENVILLE in the treasury office, Whately drew up the STAMP ACT (1765). In the process he solicited the opinion of as many experts on colonial affairs as possible, including THOMAS HUTCHINSON. Ignoring most of this advice, which indicated that colonists would oppose the measure, Whately drafted a reasonable law that the British thought would be self-enforceable.

Whately also wrote the pamphlet, *The Regulations Lately Made concerning the Colonies and the Taxes Imposed Upon Them, Considered* (London, 1765), which not only defended the SUGAR ACT (1764) but also elaborated upon the idea of virtual representation. Whately admitted that it was a violation of liberty to impose taxes without the consent of representatives of the taxed. However, he argued that the colonists were represented in Parliament in the same manner that all British subjects were represented: “for every Member of Parliament sits in the House not as a Representative of his own Constituents, but as one of that August Assembly by which all the Commons of *Great Britain* are represented.” In other words, each member of Parliament protects the “Rights and Interests” of the whole empire. This was a powerful argument in the 18th century and was taken seriously by many colonists. DANIEL DULANY responded by arguing that since Parliament could pass taxes on the colonists that had no impact on the people of Great Britain, even by the standards of virtual representation, Parliament did not represent the colonists.

Whately remained an active politician and member of Parliament until his death in 1772. But even from the grave, he exerted some influence on the imperial crisis. BENJAMIN FRANKLIN had gained possession of a series of letters written by Thomas Hutchinson to Whately, in which the Massachusetts official had decried the course of events in Boston in the late 1760s. Franklin forwarded the letters to Boston, where they were made public in 1773, destroying the last vestiges of Hutchinson's popularity and leading to his recall as governor.

**Wheatley, Phillis** (1753?–1784) *Senegalese-born American poet and former slave*

This AFRICAN-AMERICAN prodigy surprised European Americans of the revolutionary generation with her ability to command language and write poetry. Wheatley was born in Africa and was captured by slave traders when she was about eight years old. She was fortunate in that she was brought to Boston and sold to an affluent family—the Wheatleys—as a household slave. Susanna Wheatley treated young Phillis kindly, teaching her to read and write English. Phillis's extraordinary talents soon became apparent, and she even learned enough Latin to translate Ovid. Still only a teenager, she began to write poetry on religious themes that astonished her white patrons. By 1772 several

of her poems had been published, and her fame spread across the Atlantic. The Wheatleys sent Phillis to England in 1773, where she impressed a new round of patrons. A volume of her poetry was published in England, *Poems on Various Subjects, Religious and Moral* (1773). But the illness of her North American patroness, Susanna Wheatley, compelled her to return to Boston. Soon after arriving in Boston, Phillis received her manumission papers. For the next few years, even though her ex-owners both died, she continued to write poetry, some of which supported the resistance to Great Britain. In 1778 Phillis married a free black, named John Peters. Their life was a struggle together. She had three children, but two died in early infancy. Never of a strong composition, Phillis died in poverty and obscurity in 1784, about age 30.

Phillis Wheatley was an important symbol for her time. She was the first African-American writer to get published. In an age when men such as THOMAS JEFFERSON denied

the intellectual equality of blacks, the achievements of an African American such as Phillis Wheatley came to be a powerful ANTISLAVERY argument. While much of her work was religious, she not only wrote some patriotic poetry but also explored issues of race. In her 1773 poem “On Being Brought from Africa to America” she wrote:

‘Twas mercy brought me from my *Pagan* land,  
Taught my benighted soul to understand  
That there’s a God, that there’s a *Savior* too:  
Once I redemption neither sought nor knew.  
Some view our sable race with scornful eye,  
“Their colour is a diabolic die.”  
Remember *Christians*, *Negroes*, black as *Cain*,  
May be refin’d, and join th’ angelic train.

## Whigs

The term “Whig” has several different meanings, depending on the historical context. The term emerged in the second half of the 17th century in Great Britain as a derogatory word to describe those individuals who opposed James, the duke of York, inheriting the Crown of his brother Charles II. Supporters of the Stuart monarchy derived the word from “whigamore,” which had been applied to Scottish coveneters (Presbyterians who helped to bring on the English civil wars of the 1640s) as an insult. Whigs supported parliamentary supremacy and the Protestant succession. They thus became the prime movers behind the Glorious Revolution (1688–89) that drove the CATHOLIC James II from the throne and enhanced the role of Parliament in government. The Whigs then coalesced into a political party opposed by the Tories who supported a stronger monarchy. With the Hanoverian succession in 1714, the Whigs emerged as the dominant political force and in one form or another they controlled the government for most of the rest of the 18th century.

However, in the 18th century important divisions also emerged among the Whigs. While the political party became entrenched under leaders like Sir Robert Walpole (sometimes this group is referred to as the Whig Oligarchy), another group, referred to as COMMONWEALTHMEN or the real or true Whigs, began to criticize Walpole and his

supporters for abandoning Whig principles and engrossing too much power at the expense of the liberty of the people. The individuals who would later become the leaders of the AMERICAN REVOLUTION became avid readers of the pamphlets and articles written by the true Whigs. Throughout the 1760s and 1770s, opposition to imperial regulation was often defended in the name of Whig principles. In fact, once the REVOLUTIONARY WAR (1775–83) broke out, the supporters of the resistance movement called themselves Whigs and their opponents Tories.

There are two other important uses of the word Whig. First, an American Whig political party, advocating a more active government, emerged in the 1830s and 1840s. And second, historians sometimes use the phrase “Whig history” to describe an interpretation of either the English or the American past that de-emphasizes conflict among social groups and centers on the inevitable unfolding of the triumph of liberty and democracy. Critics of this interpretation do not see that triumph as inevitable or complete. They also believe that Whig history tends to focus on stories of great white men and ignore the history of race, class, and gender.

## Whiskey Rebellion (1794)

The Whiskey Rebellion was an outbreak of armed violence and collective disorder that erupted in 1794 in western Pennsylvania when federal tax collectors attempted to serve court summonses for failure by farmers and distillers to pay an excise tax on whiskey.

In 1791 Secretary of the Treasury ALEXANDER HAMILTON proposed, as a part of his financial plan for the United States, a series of excise taxes to raise revenue for the new federal government. The most controversial of these taxes fell on distilled spirits with a 25 percent tax on all whiskey production. This new excise tax was particularly burdensome on farmers in the West, where whiskey was used as a form of barter and was an integral part of the ECONOMY.

The excise tax met with widespread resistance, especially in the FRONTIER areas of Pennsylvania and its collection was difficult. That region, and the frontier as a whole, suffered from a lack of hard currency that was required to pay the taxes. Without ready cash, farmers became increasingly frustrated at what they perceived to be an unresponsive government that did not understand the hardships they faced due to a lack of specie. Moreover, citizens in the West resented having to travel to distant courts in Philadelphia to plead their cases rather than using local courts.

Throughout 1792 and 1793, local resistance to the tax oftentimes led to violence. After several meetings denouncing the law, farmers took matters into their own hands. Following a pattern of collective behavior similar to the action practiced during the RESISTANCE MOVEMENT (1764–75) against Great Britain, a group of individuals calling themselves the “whiskey boys” attacked federal tax collectors, shaving their heads, stripping them naked, tarring and feathering them, and leaving them tied to trees deep in the woods. Even the nonviolent protest became heated as DEMOCRATIC-REPUBLICAN SOCIETIES (anti-Washington administration political clubs) in the East as well as the West called for a repeal of the tax.

Failed efforts to collect the tax only strengthened the federal government’s resolve. In the summer of 1794, at the urging of Alexander Hamilton, Marshal David Lennox and Supervisor of Collection John Neville tried to serve writs to western Pennsylvanians to appear in Philadelphia courts to answer for non-compliance with the tax law. In response to these efforts by the government, some 50 armed local men assembled at the Mingo Creek Church in Washington County. Word spread quickly, and soon an even larger group gathered to confront the marshal and Neville. On the morning of July 16, the men surrounded John Neville’s house on Bower Hill. These individuals believed they would find David Lennox there, and they planned to demand the surrender of both the writs and Neville’s commission as tax collector. However, only Neville, his wife, and granddaughter were in the house. In a brief skirmish, Neville repulsed the attackers, wounding several and killing one. The next day, after Neville left his house in the hands of a military guard, the whiskey rebels renewed the assault. During this exchange of gunfire at Bower Hill several men were wounded and at least two were killed before the government forces surrendered and the rebels destroyed the house. Among the dead was insurgent leader James McFarland, a REVOLUTIONARY WAR (1775–83) hero and militia captain, who became a martyr to the insurrectionists and a regional symbol of the anti-excite cause.

Events moved faster after the violence at Bower Hill. At a meeting on July 23, David Bradford, a DEMOCRATIC-REPUBLICAN PARTY politician and the county’s attorney general, emerged as a spokesman for the more radical insurgents. Bradford called for the raising of a militia as well as confiscating the federal mails to determine government sympathizers. Angered by what he found in the captured mail Bradford threatened to march the local militia on Pittsburgh as a show of force. Moderates managed to convince the whiskey rebels not to follow Bradford’s call to occupy Pittsburgh. In the meantime, the federal government sent a commission to western Pennsylvania to assess the situation, and it determined that it was impossible

to resolve the conflict peacefully. Approximately 12,000 troops were then mustered, from Pennsylvania, Maryland, Virginia, and New Jersey by order of the administration of GEORGE WASHINGTON to quell the rebellion. With Washington in the lead, the army marched to Fort Cumberland, where Washington turned command of the army over to General HENRY LEE. By the time the federal army reached Pittsburgh, the rebel leaders, including David Bradford, had already fled the region. Still, the army arrested about 150 insurgents. Many of these individuals were released, but about 20 men were marched back to Philadelphia to stand trial; only two were found guilty, and they were later pardoned by President Washington.

The suppression of the Whiskey Rebellion strengthened the power and legitimacy of the federal government to enforce law. It also allowed the president to lay the blame for the rebellion squarely on the Democratic-Republican Societies, thus discrediting and permanently damaging their effectiveness to criticize the Washington administration.

### White Plains, Battle of (October 28, 1776)

At the Battle of White Plains General WILLIAM HOWE’s superior British forces outmaneuvered and outfought the CONTINENTAL ARMY under General GEORGE WASHINGTON but failed to crush the revolutionaries. Howe had compelled Washington to move most of his army out of the northern part of Manhattan by landing in Westchester County, threatening to cut Washington off from the mainland. The Continental army, numbering as many as 14,000, dug in along a series of hills at the village of White Plains. While the entrenchments presented a formidable obstacle, Washington initially failed to recognize that they were dominated by Chatterton Hill across the Bronx River and on his right. Just before the battle, Washington realized his mistake and quickly sent troops to fortify the position.

The Continentals began the battle by sending several regiments (about 1,500 men) against the British. This force was driven back by repeated flanking movements. Although Howe planned a frontal assault against the Continental line, it was never carried out. Instead, he sent British and HESSIAN units against the hastily constructed position on Chatterton’s Hill. The first assault was beaten back, but ultimately the Hessians and some British dragoons swung

around the far Continental right, routed the militia units in front of them, and swept the revolutionaries off the hill. With a few hours of daylight left, the British, however, did not then take advantage of their position to roll up the entire enemy line. The British suffered 231 casualties. The revolutionary losses are less certain; they numbered anywhere from 150 to 350 men.

A second attack on October 30 was canceled because of a heavy rainstorm. Washington used the cover of the weather to withdraw a few miles farther to stronger positions. But this move also allowed Howe to cut back toward Manhattan, surround FORT WASHINGTON, and capture 3,000 revolutionary troops.

**Whitney, Eli** (1765–1825) *inventor of the cotton gin, arms manufacturer*

Eli Whitney not only invented the cotton gin, but he also pioneered the use of interchangeable parts in the production of firearms. Whitney grew up on a small farm in Westboro, Massachusetts. At age 17 he left home to attend Yale College. After graduating in 1792, he headed south to pursue a teaching career. He accepted a job as a tutor in Savannah, Georgia, where he made the acquaintance of Catherine Greene, widow of REVOLUTIONARY WAR (1775–83) general NATHANAEL GREENE. While visiting her plantation, Whitney saw the need for a machine that could separate the sticky seeds from the cotton-lint in green-seed, short-staple COTTON. Demand for cotton to feed English mills was high, and a cheap way to clean cotton was needed to make large-scale production possible in the South. Whitney produced a workable cotton gin in 1793, and he patented it 1794. However, he was unable to protect

Engraving showing slaves operating a cotton gin while owners inspect the cotton (Library of Congress)

his patent, and he and his partner, Phineas Miller, made very little money for the invention. Because he could not protect his patent, unlicensed copies of Whitney's cotton gin spread throughout the South, helping cotton become the most valuable crop in the region. More ominously, the cotton boom breathed new life in the institution of southern SLAVERY.

Whitney found his way to financial success in the fire-arms industry while making an important contribution to the development of mass production and industrialization. In 1797, when the United States faced a possible war with France, Whitney won a contract from the federal government to produce 10,000 muskets for the army. Whitney promised to produce the muskets in two years. He built a factory in Hamden, Connecticut, and designed a system of manufacturing parts in standard sizes that could be used interchangeably to build complete muskets. This approach was revolutionary since guns at the time were made separately by individual gunsmiths, which meant that if a part broke, it had to be remade by hand to fit that particular gun. Whitney's method of making standardized individual parts was ultimately successful, although it took him 10 years instead of the promised two. Whitney convinced many who doubted his methods in 1801 when he arranged a demonstration for incoming president THOMAS JEFFERSON. At that demonstration in WASHINGTON, D.C., witnesses picked random parts from scattered piles and then were able to use those parts to assemble complete working muskets. Whitney's method marked an important step in the development of techniques of mass production.

Whitney married Henrietta Edwards in 1817. They had four children, three of whom survived into adulthood. His son, Eli Whitney, Jr., continued to manufacture arms in the Hamden plant after his father's death in 1825.

## Wilderness Road

The land speculating Transylvania Company hired DANIEL BOONE to establish a path to the west of the Appalachian Mountains to allow new settlers to reach the firm's property in what is now Kentucky. Before the creation of the new route—the Wilderness Road—travel to the region south of the Ohio River was tedious and dangerous. One route started in Pittsburgh and continued down the Ohio to present day Louisville. Boats made for easy targets for NATIVE AMERICANS on the banks who wanted to stop the intruders from settling on their hunting grounds. The road

was actually safer. People could travel in large groups, and if they were attacked they could seek shelter in the woods and hills that lined the way. The road stretched from the southern reaches of Pennsylvania through the Cumberland Gap in western Virginia to the banks of the Ohio River at Louisville. Parts of the trail branched off to Boonesborough and Lexington.

On March 10, 1775, Daniel Boone and about 30 men set out to blaze the trail. The pioneers soon ran into trouble. Immediately to the south lay the Chickamauga, a confederation of refugees from CHEROKEE, Shawnee, and other Native Americans. Their leader, DRAGGING CANOE, promised that Kentucky would be “a dark and bloody ground.” He believed that the Native Americans who sold the lands to the Transylvania Company and other European Americans had no right to do so. On March 24, 1775, a war party attacked the advanced elements of the road builders, killing one of the leaders and his slave. The main group withstood another attack by quickly building a fort of logs. After beating back the assault, they continued with the road. By May 1775, the men arrived at the lush bluegrass country of western Kentucky where they built Boonesborough. The site had many of the essentials for a thriving town: water, fertile soil, and access to the salt licks for their livestock.

The REVOLUTIONARY WAR (1775–83) soon threw Kentucky into turmoil. Great Britain allied itself with the Native Americans of the region, and warriors attacked settlements throughout the territory. European Americans retaliated by hunting down and killing Indians without bothering to find out if they were friendly or not. After the war, the road became a pathway for a flood of new immigrants from the East seeking cheap lands.

## Wilkes, John (1725–1797) politician, writer

In the eyes of many North American colonists, the Englishman John Wilkes was a champion for liberty and justice who fought for these rights against a dishonest government. Born into a modest family—his father, a member of the middle class, was a successful distiller—Wilkes was well educated, witty, and exuberant. He attended school in Europe and, after returning to Great Britain, won election to Parliament in 1757. In his early political career, Wilkes was a close friend and supporter of WILLIAM PITT.

In 1763 Wilkes started publication of the satirical journal, *The North Briton*. The publication of this journal was in direct opposition to *The Briton*, which was a journal financed and backed by the British government. In the infamous No. 45 issue of *The North Briton*, Wilkes overstepped his bounds and aggressively attacked the integrity of the British government. He accused British politicians of putting lies into the mouth of the king. The government labeled his attack as seditious libel, a serious charge that required a trial. Wilkes also ran into trouble for publishing a pornographic satire called "An Essay on Woman," which was a parody on Alexander Pope's "Essay on Man." In 1764 the king and his ministers dismissed Wilkes from his seat in Parliament. In order to avoid the libel suit and legal prosecution, Wilkes fled across the English Channel to France. However, after running out of funds in 1768, he had no choice but to return to his home country. The government had not forgotten his attack and forced him to stand trial. He was found guilty and sentenced to several months of light probation.

During his trial, Wilkes ran for election to Parliament. Although he won the election, the government barred Wilkes from his seat and called for a new election. Wilkes won election to Parliament again, not once, not twice, but four times. Each time he was prevented from taking his proper place.

The American colonists followed the struggle between Wilkes and Parliament with great interest. Many colonists thought Parliament had treated Wilkes unjustly and, believing he was fighting for the rights of all Englishmen, came to view Wilkes as a symbol of liberty. Fearing that if the British could crush liberties at home they would do the same in North America, colonists actively sought to help Wilkes in his plight. Virginia sent him tobacco, and South Carolina sent money to pay down his debts. Colonial Americans did not express support for Wilkes more risqué publications. However, the phrase "Wilkes and Liberty" became commonplace, and the number "45," for the *North Briton* No. 45, also became symbolically important throughout the colonies. (Both Wilkes and colonial Americans knew that the number also suggested a challenge to the House of Hanover, since the last invasion of the Stuart heir to the throne—the so-called pretender—occurred in Scotland in 1745.) In 1774 Wilkes was elected again to the House of Commons and was allowed to take his seat.

While in Parliament during the REVOLUTIONARY WAR (1775–83), Wilkes often spoke in favor of independence for the United States. He believed the war was unreasonable and brutal. He felt what was lost could not be regained by force, a viewpoint that furthered his popularity in North America. Along with Isaac Barré, the city of Wilkes-Barre, Pennsylvania was named after him. Besides serving in Parliament, Wilkes became lord mayor of London in 1774 and

city chamberlain—in charge of administrative expenses—in 1779.

**Further reading:** Louis Kronenberger, *The Extraordinary Mr. Wilkes, His Life and Times* (New York: Doubleday, 1974); Peter D. G. Thomas, *John Wilkes, A Friend to Liberty* (Oxford: Oxford University Press, 1996).

**Wilkinson, James** (1757–1825) *army officer, conspirator*

EDMUND RANDOLPH once remarked that James Wilkinson was "the only man that I ever saw who was from bark to the very core a villain." Wilkinson was born in 1757 in Maryland, and his father was a merchant-planter. In 1773 Wilkinson traveled to Pennsylvania, where he studied to be a doctor. MEDICINE did not seem to be his calling, and Wilkinson's peripatetic spirit soon led him north to Boston where he lived until the beginning of the REVOLUTIONARY WAR (1775–83).

In 1775 he served as an aid to General NATHANIEL GREENE and supplied the revolutionary army with information about the maneuvers of the British troops in Boston. Wilkinson moved up the ranks of the CONTINENTAL ARMY and participated in the BATTLES OF TRENTON AND PRINCETON (December 26, 1776, and January 3, 1777). Between 1777 and 1781, he served as secretary on the Board of War. Wilkinson's personality—he had a tendency to self-promotion—led to dispute with other officers, and he even fought a bloodless duel with General HORATIO GATES. On November 12, 1778, Wilkinson married Ann Biddle, the daughter of a Pennsylvania businessman.

After the war ended, Wilkinson settled in Pennsylvania and began farming. In 1784 he moved to Kentucky, where he continued to be more interested in his own welfare than in serving the government of the United States. While still in the army's pay, he began a long connection with Spanish officials, whereby he collected a subsidy of \$2,000 a year for information and support. He even swore an oath of loyalty to the king of Spain. He was also given special privileges allowing him to ship goods down the Mississippi and began discussions for a separatist movement on the FRONTIER to create an independent state allied with Spain. Yet, as a military officer he served under General ANTHONY WAYNE at the BATTLE OF FALLEN TIMBERS (August 20, 1794) and was later made commandant of the fort at Detroit.

Despite his secret connections to Spain, Wilkinson's star continued to rise in the United States. In 1805 Congress separated the Territory of Orleans (most of the present state of Louisiana) and the Louisiana Territory—the rest of the land that came with the LOUISIANA PURCHASE (1803)—and President THOMAS JEFFERSON appointed Wilkinson to serve as military governor of the Louisiana

Territory, headquartered in St. Louis. As governor, Wilkinson was a busy man, especially in 1806. In that year he sent Zebulan Pike to the Rocky Mountains to explore the southern limits of the Louisiana Purchase (and probably to spy on the Spanish). Wilkinson also headed to the Sabine River district to settle a boundary dispute in Texas. Simultaneously, Wilkinson engaged in discussions with AARON BURR to set up some sort of western empire, either in Louisiana or in Mexico. Historians remain unsure of Burr's exact plans. Then, as Burr headed down the Ohio and Mississippi Rivers to his rendezvous with Wilkinson and other western leaders, the ever-duplicitous Wilkinson changed his mind and reported the plot to Jefferson. Wilkinson marched on New Orleans, summarily arrested a few "conspirators," and sought to cover his own tracks by preparing for a Burr invasion that would never come.

Somehow Wilkinson emerged from the Burr conspiracy relatively unscathed. In 1808 Jefferson sent Wilkinson to New York to put down opposition to the EMBARGO OF 1807. Wilkinson, however, also had to face two courts of inquiry. One focused on the high number of deaths from disease (see also DISEASE AND EPIDEMICS) among his troops at a camp at Terre aux Boufs in Louisiana, and the other centered on Wilkinson's involvement in the Burr conspiracy. In both cases Wilkinson was acquitted of any malfeasance. During the War of 1812 (1812–15), Wilkinson commanded troops in the southwest, which captured Mobile from the Spanish early in 1813. Later in that year and in 1814 Wilkinson commanded some of the troops along the Canadian border, but his effort at invading CANADA fell apart because of his poor planning and because other senior officers had little confidence in him.

In 1810 Wilkinson had married for the second time; his new wife was Celestine Laveau Trudeau. They had three children. Between 1821 and 1825 Wilkinson entered land speculation schemes in Texas and Mexico. He died on December 28, 1825, in Mexico City and is buried at Iglesia de San Miguel Archangel.

**Wilson, James** (1742–1798) *signer of the Declaration of Independence and the U.S. Constitution, associate justice of the Supreme Court*

Wilson was a progressive legal thinker, a signer of the DECLARATION OF INDEPENDENCE (July 4, 1776), and an important member of the CONSTITUTIONAL CONVENTION. Born at Carskerdo, near St. Andrews, Scotland, Wilson's farmer

parents, intending him perhaps for the Presbyterian ministry, provided him with a superior EDUCATION. He studied at the University of St. Andrews, the University of Glasgow, and at the divinity school attached to St. Mary's College, an important seat for the ideas of the Scottish Enlightenment. Wilson, however, did not complete his theological studies, and with an eye toward secular advancement, in 1765 he sailed for North America. Once in Pennsylvania, he applied to and was accepted at the law offices of JOHN DICKINSON, where he studied for the bar and to which he was admitted in late 1767. In 1771 Wilson married the heiress Rachel Bird. In July 1774 he was elected to the Cumberland County COMMITTEE OF CORRESPONDENCE and to the first Pennsylvania provincial convention. That year Wilson amended a manuscript he wrote as a law student in 1768 and had it published under the title *Considerations on the Nature and Extent of the Legislative Authority of the British Parliament*. In this pamphlet, distributed to the members of the FIRST CONTINENTAL CONGRESS, Wilson asserted that the British Parliament had no authority whatsoever over the colonies and stated his political conviction that "all power is derived from the people." Though Wilson originally opposed the colonists' drive for independence (his interest was to preserve Pennsylvania's balanced government), as a member of the SECOND CONTINENTAL CONGRESS he voted for and signed the Declaration of Independence.

While Wilson held that government rested on the consent of the governed, he sought to impede what he feared was the unchecked will of the majority. At heart he was a conservative revolutionary. He was disgusted at the state's radical and democratic 1776 constitution that abolished the office of governor and placed all political power in a unicameral legislature (see also CONSTITUTIONS, STATE). His continued support of the independence movement, legal defenses of LOYALISTS, his position on the state constitution, and his opposition to price controls generated popular animosity against him. In what would be labeled the Fort Wilson riot, shots were exchanged between militiamen in the street with a group of Wilson's supporters at his home on October 4, 1779. Several men in the street, and one person in Wilson's house, were killed before an elite troop of horse dispersed the crowd.

Political conservatives regained control of Pennsylvania in 1782 and sent Wilson to Congress, where he served in 1782–83 and again from 1785 to 1787. At the Constitutional Convention, Wilson strongly supported the creation of a national government and then led the efforts for the RATIFICATION OF THE CONSTITUTION in Pennsylvania.

Seeking to be named as the first chief justice of the SUPREME COURT, Wilson in 1789 wrote to President GEORGE WASHINGTON expressly to ask for the post. Washington instead invited JOHN JAY to become chief justice,

and he appointed Wilson as an associate justice. Wilson supported judicial review (the power of the courts to decide if government acts adhere to the Constitution) and believed in the inherent importance of the Supreme Court. In the end, Wilson's financial problems stemming from land speculation and entrepreneurial ventures ruined him and cast shadows across his reputation. He died insolvent.

### **Witherspoon, John** (1723–1794) *minister, educator*

John Witherspoon was an educator, Presbyterian clergyman, and signer of the DECLARATION OF INDEPENDENCE (July 4, 1776). He was born and educated in Scotland, where he entered the University of Edinburgh at the age of 13 to study theology. After serving as pastor at several Presbyterian churches in Scotland, he was offered the presidency of the College of New Jersey (later Princeton University). Witherspoon moved to Princeton in 1768.

As a college president, Witherspoon brought the ideals of the Enlightenment to Princeton. Under his leadership, Princeton attendance rivaled that of Yale, and the financial endowment blossomed. He raised teaching standards and expanded the curriculum to emphasize instruction through lecture. Library holdings increased in quantity as well as quality. Some scholars have credited Witherspoon with inventing the word “Americanism,” based on a 1781 article that explored the differences between the language spoken in North America and that in England.

As a clergyman, Witherspoon's theology was evangelical but moderate, appealing to Old Side and New Side Presbyterians alike. Witherspoon's theology also connected Christianity to REPUBLICANISM, emphasizing what he called “the rights of private judgement . . . universal and unalienable.” In Scotland, Witherspoon had defended the right of people to choose their own ministers. In North America, the ideology of popular rights and the resistance to arbitrary power found renewed favor in Witherspoon's messages.

In June 1776 Witherspoon was a delegate to the SECOND CONTINENTAL CONGRESS in Philadelphia. He became the only clergyman to sign the Declaration of Independence. Witherspoon continued to work in Congress, laboring on more than 100 committees and contributing to the construction of the ARTICLES OF CONFEDERATION. In 1787 he attended the New Jersey convention that ratified the Constitution.

Witherspoon's final years were a struggle. His wife, Elizabeth, died in 1789. Witherspoon married again at

the age of 68. His second wife, Ann Dill, was a 24-year-old widow; the age difference caused a minor scandal in the halls of Princeton. After two years of suffering from blindness, Witherspoon died in 1794. He was buried on the grounds of the university he had guided since arriving in North America.

### **women's rights and status**

Prior to the AMERICAN REVOLUTION, most European-American women identified themselves primarily as members of households and families, deriving their status less from their own abilities and ambitions than from the statuses of their fathers and husbands. Women's work focused largely on the household, including cleaning, child rearing, making clothing, processing and preserving food, and managing the dairy and the kitchen garden. The small number of women who managed businesses, farms, or plantations typically did so following a husband's death (and even then this practice was exceptional). In New England, married women could serve as “deputy husbands,” an informal status allowing them to make legally recognized business decisions when their husbands were absent or ill. But a woman assumed the role of deputy husband as a temporary addition to their primary responsibilities, which remained centered in households. Even very wealthy women did not escape housework, although after midcentury, they were increasingly valued as loving wives and mothers rather than as productive household managers. The economic value of European-American women's household labor was widely recognized, for few households could survive without the services that women provided. Nevertheless, gender relations within households were hierarchical, subordinating women to their fathers and husbands.

European-American women's precise legal rights varied from colony to colony, although the shared British common law tradition made most practices fairly similar throughout the 13 colonies. Coverture was the most important legal principle in determining women's rights and status. Under coverture, a woman's legal and political identity was absorbed by her husband, who assumed control over his wife along with her property, earnings, and children. Coverture could be mitigated by antenuptial contracts, which allowed women to maintain control over property they inherited or acquired after marriage. But antenuptial contracts required the prospective husband's consent

and were only signed by a minority of wealthy couples. Women whose husbands were absent for extended periods or whose husbands had deserted them or gone bankrupt could petition for “feme sole” status, allowing them to engage in TRADE and control property. Widows were typically guaranteed of receiving a “dower right,” one-third of their husbands’ property; even so, they lacked total control over their inheritances. For example, in most colonies a widow could not sell inherited land without permission from the court; similarly, a husband might choose to make his wife’s inheritance contingent on remaining single. Access to divorce was extraordinarily limited, requiring a legislative act in most colonies. Although the New England colonies permitted “absolute divorce,” which allowed both parties to remarry, these divorces were granted rarely and mostly to men.

The development of colonial economic and legal systems affected enslaved women and NATIVE AMERICAN women differently. By midcentury, the expansion of SLAVERY dramatically increased the total number of slaves in the Chesapeake and the coastal South, enabling enslaved women to find partners and establish families and kin networks. And although most enslaved women continued to work in the fields, a small percentage worked as house servants, nurses, or midwives. Although these changes improved the quality of women’s lives, they did not mitigate the legal constraints of slavery. Slave marriages were not recognized by law; all children born to enslaved women followed the condition of their mother, regardless of their fathers’ status, and enslaved parents had no legal authority over their children. Native American women saw their status deteriorate over the course of the 18th century, as the growing reliance on European trade upset the balance of power between women and men in Indian communities. European traders sought goods such as skins and furs that resulted from hunting and trapping, work traditionally performed by Native American men; in return, they offered European weapons, clothing, and cooking utensils. When Indian communities became dependent on European goods, women were devalued because their work did not produce tradeable commodities. Women in many tribes, including the CHEROKEE and IROQUOIS, also appear to have lost political power during this period, partly because of men’s new economic dominance and partly because Native American–European diplomacy, which was conducted almost exclusively by men, played an increasingly pivotal role in political decision making.

The RESISTANCE MOVEMENT (1764–75) and the REVOLUTIONARY WAR (1775–83) changed women’s status within both their households and the larger public sphere. Much of the agitation during the imperial crisis was aimed at encouraging resistance to taxation and the undermining of parliamentary authority by boycotting the imported goods

that Parliament had taxed. Because many of these goods, especially tea and cloth, were purchased by women for use in households, European-American women’s work became politicized. A woman’s decision to buy tea for her family or boycott it was no longer private and personal; instead, it was a political choice with repercussions that affected her community and even the 13 colonies. Similarly, in order to avoid purchasing British cloth, women began spinning and weaving, tasks that many had abandoned by the 1760s. In the South, slave women were removed from the fields and set to spinning and weaving. And in northern urban areas, many women and children began making cloth at home for sale. Compared to British manufactures, “homespun” cloth was rough and coarse; wearing homespun became a visible badge of patriotism. And during the war, homespun was used not only for regular clothing but also for soldiers’ shirts and blankets. Domestic textile manufacture became even more explicitly politicized when women formed associations, often calling themselves “Daughters of Liberty,” to spin, weave, and sew.

With the outbreak of the Revolutionary War, many WHIG and LOYALIST women faced new challenges. The absence of their husbands, sons, and fathers left them responsible for managing farms, plantations, and businesses under uncertain and dangerous conditions. Other women became CAMP FOLLOWERS, traveling with the CONTINENTAL ARMY to provide laundry, cooking, and sewing. Elite urban women formed associations to raise money in support of the revolution. While some women saw these new responsibilities as burdens, others saw them as opportunities. All these activities enlarged women’s interests, turning many into passionate political advocates, broadening their vision of the world, and changing their understanding of themselves. Many women no longer identified themselves only as members of families and communities. Instead, women and men alike began to see themselves as patriots, as participants in a political process that extended far beyond their households and communities.

Revolutionary agitation and a deepening commitment to REPUBLICANISM also politicized European-American households in more abstract ways. Political thinkers had long drawn analogies between political and family structures, arguing, for example, that a king’s right to rule his subjects was analogous to a man’s right to rule his wife and children. In the revolutionary context, the tyranny of Crown and Parliament seemed to parallel the tyranny of an unequal marriage. Revolutionaries aspiring to create a society based upon virtue, in which citizens were bound by affection and respect rather than duty, invoked more egalitarian marriages as the model for a republic. This less hierarchical vision of marriage celebrated husbands and wives as each other’s companions and gave Anglo-American women new stature. Sermons, periodicals, and fiction

This drawing of women voting in New Jersey depicts the sole instance in revolutionary America when property qualifications for suffrage were defined without regard to sex, from 1790 to 1807. (*Howard Pyle Collection, Delaware Art Museum*)

trumpeted the republican woman for her virtue, patience, and industry, qualities that had been valued long before the war. But this literature also singled out new qualities for praise, including reason, EDUCATION, and civic-mindedness. By emphasizing the virtue and importance of the abstract, idealized wife, politicians and writers necessarily raised the status of real European-American women.

Although the American Revolution did not abolish slavery, enslaved African-American women and men took advantage of the war to pursue freedom. In peacetime, both before and after the Revolutionary War, runaway slaves were disproportionately male; women's ties to children made escape especially difficult. During the war, however, the British army offered enslaved women and men protection and freedom in return for abandoning their Whig masters, enabling entire families to escape together. And the chaos of war made it possible for groups of slaves to escape regardless of the presence of the British army. THOMAS JEFFERSON later estimated that some 30,000 Virginia slaves ran away over the course of the war, many of them women. Of the 23 slaves who escaped from Jefferson

himself, more than half were female. In Massachusetts, groups of slaves, including women, joined together to petition the legislature for freedom. Immediately after the war, a small flurry of voluntary manumissions helped create a free black community in the Upper South. Both during and after the war, slaves throughout the colonies and states pointed out the contradiction between the defense of slavery and the revolutionary ideal of self-determination.

Just as the Revolution did not abolish slavery, it did not change European-American women's legal status. Nevertheless, the creation of a republic did lead to subtle changes in white women's status. Although the founders never considered granting women suffrage, they did consider them to be citizens of the nation. Thus, women were entitled to civil rights, which included representation in the lower house of Congress, where legislators were apportioned by a state's population, male and female alike. From the founders' perspective, not all citizens were entitled to the same rights; suffrage depended not on CITIZENSHIP, but on a combination of factors, including gender, race, and property ownership, that excluded many men as well

as women from voting. Men who could vote were expected to represent the interests of their dependents, including women, children, and slaves, at the polls. European-American women were thus excluded from full political rights but entitled to civil rights such as representation and legal protection. (A few propertied women in New Jersey could vote from 1790 to 1807, when the right of the franchise was deliberately removed from them.) Significantly, this ambiguous status did nothing to challenge the fundamental legal principle of coverture, which continued to restrict married women's property rights and structure their relationship to the state.

As nonvoting citizens, European-American women were expected to serve the state primarily through their families as "republican wives" and "republican mothers." The ideology of republican wife- and motherhood incorporated the notions of female virtue that had emerged during the Revolution into a broad program for producing virtuous citizens. The republican wife inspired and encouraged her husband, the voting citizen, to adhere to the highest moral standards both at home and in the public sphere. The republican mother was charged with inculcating republican virtues in her children, especially her sons, from early infancy. Revolutionary Americans thus imbued traditional female roles with new political significance. This new valuation of wife- and motherhood appears to have changed expectations of marriage, at least among the middle and upper classes. Diaries and letters suggest that both women and men began to view marriage as a source of emotional fulfillment and personal happiness rather than as only Christian duty and economic strategy.

These new expectations manifested themselves in divorce proceedings and in new educational opportunities. Following the Revolutionary War, several states enacted legislation to make divorce more accessible, allowing "loss of affection" to be cited as grounds for divorce. Moreover, although divorce remained rare, a greater percentage of divorces were sought and received by women. Indeed, access to divorce was women's clearest legal gain in the early republic. But these changes did not benefit poor women, who could not afford legal costs. Nor did they apply to women of any class in the South. There, state legislatures retained the right to grant divorce through individual acts of law until well into the 19th century.

Ideals of republican womanhood contributed to a dramatic expansion of educational institutions that benefited middle-class and wealthy women throughout the nation. Because republican virtue demanded reason and intellect as well as affection, increasing numbers of people in the United States committed family resources to finance their daughters' educations. Hundreds of private female academies opened throughout the nation, offering young women an unprecedented curriculum in reading,

composition and rhetoric, mathematics, history, the sciences, ART, MUSIC, and, less frequently, Greek and Latin. But these gains did not extend to poor women or African-American women.

### writs of assistance

In 1761 a famous legal case came before the Supreme Court of Massachusetts challenging the general search warrants—writs of assistance—issued to British-appointed customs officials. This case is often cited as the opening salvo in the imperial crisis that led to the AMERICAN REVOLUTION. More than half a century later, JOHN ADAMS, who watched the court case and was entranced with the brilliant oratory of JAMES OTIS, JR., attacking the writs, proclaimed "Then and there the Child of Independence was born."

Writs of assistance had long been issued in both the colonies and in Great Britain as an efficient and effective means of customs enforcement. These writs allowed a customs official to search property without obtaining a specific court order. Without this power, it would be possible for smugglers to move goods while the customs official searched for a judge to issue a specific search warrant. There is little question that within the confines of Anglo-American law as practiced in the 18th century the writs of assistance were legal. However, they were irksome to many Boston merchants who made money smuggling and trading with the enemy during the French and Indian War (1754–63). The ascension of King GEORGE III to the throne in England in 1760 compelled the Massachusetts Supreme Court, headed by THOMAS HUTCHINSON, to reissue the writs. Whenever a new monarch became king, standard legal orders had to be reissued.

Massachusetts politics was at the time fiercely contested between a faction led by the Otis family, on one side, and the Hutchinson family, on the other. James Otis, Jr., seized the opportunity of the reissuing of the writs to

embarrass Thomas Hutchinson and to gain both merchant and popular support. Although law and precedence were on the side of the writs and Hutchinson, Otis made his case by applying to a higher ideal. He declared that the writ “is against the fundamental principles of law. The privilege of house. A man who is quiet is as secure in his house as a prince in his castle.” Otis turned this basic assertion into a challenge to Parliament by contending that “An act against the constitution is void, an act against natural equity is void.” Otis thus put the constitution, nature, and equity, above Parliament and precedent. The implications of this position, as Adams later stated, were revolutionary. In 1761, however, few were willing to pursue those implications since the British constitution was little more than a series of laws and unwritten precedents, and no one knew for sure what nature and equity would dictate. In the next two decades colonial and revolutionary Americans would return to this challenge and explore the meaning of the principles articulated by Otis. Hutchinson and the four other judges on the Supreme Court, of course, decided that the writs of assistance were legal.

### Wyoming Valley Massacre (July 3–4, 1778)

NATIVE AMERICAN and LOYALIST forces raided the communities in northeast Pennsylvania in an action that came to be known as the Wyoming Valley Massacre. The Wyoming Valley—near present-day Wilkes-Barre, Pennsylvania—had been a scene of conflict between Native Americans, Yankees from Connecticut, and Pennamites from Pennsylvania since the 1760s. The REVOLUTIONARY WAR (1775–83) merely added another and confusing set of divisions between revolutionary WHIGS and Loyalists. By the spring of 1778, the revolutionaries had come to dominate the valley, imprisoning some Loyalists and driving many others to join the British in CANADA. John Butler had recruited a number of these refugees into his ranger unit. Butler led his rangers, along with many Indians—chiefly Seneca and Cayuga—on a raid to the Wyoming Valley in the summer of 1778 to neutralize the region in the war. With approximately 800 men—about 100 were rangers—Butler arrived at the outskirts of the Wyoming settlements in late June. As the settlers received word of Butler’s imminent attack, they gathered in a series of forts for protection and sent for reinforcements. The forts did the settlers little good. On July 1, 1778, Butler’s men com-

pelled the surrender of Wintermoot and Jenkins Forts, leaving the only significant revolutionary presence in the valley at Forty Fort.

On July 3 about 360 defenders under Zebulon Butler and Nathan Denison left Forty Fort to attack the rangers and Indians. As the revolutionaries advanced, the raiders burned the two forts they had captured, leaving the impression that they were in retreat. Emboldened by the apparent withdrawal of the rangers and Indians, the revolutionaries advanced too quickly and began to fire on the enemy before they were in full range. When John Butler’s men returned fire at 100 yards, it was more effective. Denison, seeing that the rangers might outflank him, attempted to extend his line, a maneuver that his unskilled recruits proved unable to perform. In the confusion, many of the revolutionaries thought they were ordered to retreat, and as they pulled back, the battle quickly turned into a rout. Casualty figures are imprecise, but the revolutionaries may have sustained as many as 300 dead—suggesting that the rangers and Indians offered little quarter to the men trying to retreat to Forty Fort. Zebulon Butler escaped with a few men and left the valley. Denison made it back to Forty Fort with some of the other survivors.

The next day John Butler offered generous terms to the garrison at Forty Fort. He was willing to allow the settlers to remain in the valley as long they stayed neutral in the war and he was allowed to destroy the fort. He promised to protect private property but wanted the property of Loyalists that had been confiscated returned to its original owners. Denison surrendered the fort. Only one person in the fort was killed after the surrender—a deserter from the Loyalists. However, the settlers were so afraid of the loss of life, capture, and destruction of property, that they began to leave the area in droves. Women and children set off on foot across mountains and swamps, beginning what was referred to as the “great runaway.” Many of these refugees died as they abandoned their homes in the Wyoming Valley. The rangers and Indians ransacked much of this abandoned property, burning as many as 1,000 homes, destroying the local mills, and killing 1,000 head of cattle.

Labeling this raid a massacre may be something of a misnomer. There is little doubt that the battle on July 3 was unusually sanguine. John Butler himself reported the taking of 227 scalps in the fighting. Such bloodshed and “take no prisoners” attitude—although the Indians took at least five prisoners—was not unusual for both sides in the FRONTIER warfare of the period. The truly infamous part of the notion of a “Wyoming Massacre,” however, came from the rumors of atrocities during the “great runaway.” Although many people suffered and died during their trek to other settlements, those losses resulted from their own panicked exodus rather than the actions of Loyalist rangers and Native Americans.

**Further reading:** John B. Frantz and William Pencak, *Beyond Philadelphia: The American Revolution in the Pennsylvania Hinterland* (University Park: Pennsylvania State University Press, 1998); Howard Swiggett, *War out of Niagara: Walter Butler and the Tory Rangers* (New York: Columbia University Press, 1933).

### Wyoming Valley Wars

Between 1769 and 1807, a series of land wars broke out among Connecticut and Pennsylvania settlers in the Wyoming Valley—the region of Pennsylvania along the upper Susquehanna River near present-day Scranton and Wilkes-Barre. As the population increased in the American colonies during the 18th century, the need for land prompted many people to move to the western FRONTIER. This migration alleviated overcrowding in eastern communities and offered new opportunities for settlers, but it also sparked heated disputes over western land titles.

In the 1750s a group of Connecticut settlers formed the Susquehannah Company and laid claim to lands in

the Wyoming Valley region of Pennsylvania. The settlers argued that the company had a legal right to the land based on the 1662 royal charter, which outlined Connecticut's borders as extending to the Pacific Ocean. On the other side of the dispute was the Penn family who also claimed the region based on their 1681 royal charter, which laid out the family's land rights. The Pennsylvania Assembly endorsed the Penns' position and supported Pennsylvania settlers who had claims in the same region. Soon sporadic fighting broke out. Pennsylvania and Connecticut farmers raided and burned each others barns and fields. An arbitration committee under the ARTICLES OF CONFEDERATION granted the contested territory to Pennsylvania. However, confrontations over property ownership lasted until 1807, when a Pennsylvania statute was finally passed that endorsed the Connecticut settler property claims and reimbursed the Pennsylvania claimants in cash for the loss of their lands.

## **XYZ affair** (1797–1798)

The XYZ affair was an incident between the United States and France that almost led to war. Diplomatic relations between the two nations were first strained when the United States refused to aid France in its war with Great Britain, as the Franco-American Treaty of 1778 seemed to require. The situation was further aggravated with the signing of JAY'S TREATY (1794), under which the United States appeared to accept the British definition of "neutrality." President JOHN ADAMS sought to relieve the diplomatic tensions and sent CHARLES COTESWORTH PINCKNEY, JOHN MARSHALL, and ELBRIDGE GERRY to France as envoys.

By the time Pinckney, Marshall, and Gerry arrived in Paris in October 1797, the French legislature had been ejected from power. Out of this coup d'état a new French government emerged, the "Directory." CHARLES-MAURICE DE TALLEYRAND-PÉRIGORD (usually referred to as Talleyrand, and, later, Prince Talleyrand), the French foreign minister, believed he could exploit the political feuds and divisions within the United States to French advantage. He met with the envoys briefly and unofficially, promising that a more thorough discussion would follow. Weeks passed before the delegation was contacted again, and even then only by three agents of Talleyrand, not the minister himself. The agents said that the Directory would not engage in diplomatic discussion with the United States without an apology for comments made by John Adams in which the president lambasted the French for attempting to alienate the American people from their government. The agents also insisted on a "loan" of about \$10 million to the French government, plus a payment of \$250,000 for Talleyrand himself. Pinckney, Marshall, and Gerry balked at the French demands. Out of these "negotiations" devel-

oped the FEDERALIST PARTY slogan, "millions for defense, but not a cent for tribute."

The envoys reported the incident to President Adams, who initially did not relay the information to Congress. However, the DEMOCRATIC-REPUBLICANS in Congress, believing Adams was hiding information favorable to France, insisted on seeing the dispatches. Once the diplomatic letters were sent to Congress in early April 1798, they were quickly released to the public, with the names of the three French agents substituted with the letters X, Y, and Z, adding to the sense of intrigue. The incident stirred up public outrage, anger, and indignation. Congress suspended all relations with France and began to strengthen military forces.

The two nations skirmished on the seas in the QUASI-WAR (1798–1800) but avoided a full declaration of war. After several more months of waiting to negotiate, Marshall and Pinckney returned to the United States. Gerry waited in France, hoping for an opening. By the time Gerry sailed for the United States in the fall of 1798, the French government suggested that it might be open to serious negotiations. Based on this information and other reports from diplomats in Europe, Adams sent another commission to France in 1799 to resolve the growing hostility. In 1800 this team of negotiators reached an agreement with NAPOLEON BONAPARTE, who had taken control of France, and signed the Convention of 1800.

## “Yankee Doodle”

This popular song came to symbolize the American character during the REVOLUTIONARY WAR (1775–83). It emphasized the rural nature of the new United States and took pride in the lack of sophistication and the flouting of authority typical of the “yankees.” At one time the song was believed to have been composed by a British officer to deride colonials during the French and Indian War (1754–63). Subsequently, scholars have discovered that the song originated in the colonies, reflecting provincial satiric and self-mocking humor. British soldiers used the song in both the French and Indian War and the Revolutionary War to make fun of their North American cousins. Colonial and revolutionary Americans, in turn, seized upon the tune, added stanzas, and made it their own. Soldiers in the CONTINENTAL ARMY sang “Yankee Doodle” when celebrating victories, and they played it as the British stacked their arms during the surrender at SARATOGA (October 17, 1777). In the FRENCH REVOLUTION (1789–99), the Paris Guard played the song after the surrender of the Bastille. Ever since the Revolutionary War, “Yankee Doodle” has remained popular in the United States and taught to children across the nation.

## Yates, Abraham (Abraham Yates, Jr.) (1724–1796) *politician*

Abraham Yates, Jr., a civil servant most of his life, supported the rights of the common man and gave voice to the ANTI-FEDERALIST viewpoint during the 1780s. Yates’s father, a blacksmith, apprenticed young Abraham as a cobbler, but Yates yearned for more. By his late 20s, Yates was working at the law office of Peter Silvester, where he read for the bar and discovered the writings of John Locke and other thinkers of the English Enlightenment. With the support of ROBERT LIVINGSTON, JR., Yates won appointment as sheriff of Albany County in 1754. During his five

years in this position, Yates became increasingly aware of the disparity between both colonists and British subjects back in England and inequalities that existed between the colonists themselves. Having to remove poor squatters from land held, but not used, by wealthy titleholders forced Yates to confront the issue of the rights of the poor. Yates also served as sheriff during the early years of the French and Indian War (1754–63), giving him many opportunities to witness how British officers treated colonists. While serving as sheriff, Yates won election to Albany’s Common Council in 1753. As a man who had worked hard to obtain his economic and political status in the community, Yates found many supporters in Albany who reelected him every year to the council until 1773. From 1774 to 1776 he was a member and chairman of the Albany COMMITTEE OF CORRESPONDENCE.

With the start of the REVOLUTIONARY WAR (1775–83), Yates’s political fortunes grew beyond city and county positions to statewide prominence. In 1775 he was elected to represent Albany at New York’s provincial congress and continued in that capacity until the dissolution of the congress in 1777, serving as president pro tem in 1775 and 1776. While in the provincial congress, Yates also served as a member of the Council of Safety. He chaired the convention committee that produced the first New York State constitution, a document ratified by state convention in April 1777. (See also CONSTITUTIONS, STATE.) Yates was in the New York State Senate from 1778 to 1790, where he supported Governor GEORGE CLINTON’s legislative program. In 1783 Yates was also given the distinction of becoming the first postmaster of Albany.

During the 1780s, Yates’s concern for the equitable rights of all citizens increased, especially after the cessation of war with Great Britain. Yates opposed what he saw as a privileged elite trying to gain control of the SECOND CONTINENTAL CONGRESS and attempting to centralize governmental power. Writing under the pseudonyms, “Cato,” “Sydney,” and “Rough Hewer,” Yates defended the

sovereignty of the 13 states and represented the anti-Federalist point of view. He served in Congress in 1787–88 and wrote several unpublished manuscripts on New York history, highlighting examples of instances when aristocrats had repressed the common man. In 1790 Yates was elected mayor of Albany, a position he held until his death.

### Yazoo claims

The Yazoo claims arose from perhaps the grandest land speculation effort in the early republic. The story of the Yazoo claims is rife with corruption and intrigue. The resolution of Yazoo claims set the course for the expansion of federal judicial power in the era of the Marshall Court.

In 1795 the Georgia Mississippi Company and three other land speculation concerns purchased from the state of Georgia 35 million acres of land in the region centered on the Yazoo River in what became the Mississippi Territory for \$500,000. The act authorizing the sale was the product of widespread corruption. When a preliminary sale bill passed in December 1794, for example, only one of the legislators voting for it had not been bribed. In 1796 the Georgia Mississippi Company sold an 11 million acre stake in the Yazoo lands to the New England Mississippi Land Company for \$1,138,000. On the very day this deal closed, all of the Yazoo grants were repudiated by the succeeding Georgia legislature. So complete was this repudiation that all records of the grants were ordered excised from Georgia's public records and the original act of sale was burned in the public square at Louisville, where the legislature had convened, by a REVOLUTIONARY WAR (1775–83) veteran holding a magnifying glass and bringing the destroying fire down "from God."

The ensuing battle concerning the title carried over to Congress when the United States acquired Georgia's western land claims in 1802. Opposition to the claims of the Yazoo transferees was focused on the circumstances of the passage of the original act of sale. On the floor of Congress, pro- and anti-Yazooists debated incessantly after 1802 the legitimacy of the original grants and the validity of the subsequent repeal. The Yazooists were aggressive in pressing their claims, regularly employing numerous high-ranking agents, including soon-to-be Associate Justice JOSEPH STORY, as Capitol Hill lobbyists. Despite their efforts, they had no luck at forcing a compromise. The anti-Yazooists refused to recognize the land titles of speculators whose claims traced to widespread bribery and the corruption of public officials.

After failing in Congress, the speculators opted to look to the SUPREME COURT for relief. In 1803, the New England Mississippi Land Company engineered a lawsuit that ultimately reached the Supreme Court as *Fletcher v. Peck*. The speculators argued that the repeal act was unconstitutional because it violated the contracts clause of the Constitution, which provided that "[n]o State shall . . . pass any . . . Law impairing the Obligation of Contracts. . . ." The Supreme Court, under Chief Justice JOHN MARSHALL, agreed, issuing an opinion in 1810 holding that the Yazoo speculators did indeed have a valid claim, as the act of the Georgia legislature repealing the sale was unconstitutional. This marked the Supreme Court's first exercise of the judicial review power to invalidate the legislative act of a state. Anti-Yazooists in Congress were furious. Some even proposed sending federal troops into the Yazoo territory to keep the speculators out, and Congress debated whether the Supreme Court had to be obeyed. Ultimately, the federal legislature decided to abide by the Supreme Court's decision. In 1814 Congress implemented a plan for providing compensation to the Yazoo speculators.

### Yorktown, surrender at (October 19, 1781)

The British surrender at Yorktown signaled the end of the last major campaign of the REVOLUTIONARY WAR (1775–83) and ensured independence for the United States. The campaign was marked by confusion, poor choices, and misfortune on the part of the British, and superb planning, coordination between land and sea forces, and good luck on the part of the revolutionary Americans and the French.

The campaign began with General CHARLES, LORD CORNWALLIS's decision to march into Virginia after his efforts in North Carolina brought few tangible results. Leaving Wilmington, North Carolina, on April 25, 1781, Cornwallis reached Petersburg, Virginia, by May 20. Once in Virginia he met BENEDICT ARNOLD, and another British army. With about 7,000 men, he unleashed a devastating series of raids that sacked the state's capital and almost captured Governor THOMAS JEFFERSON. Continental troops under the command of the MARQUIS DE LAFAYETTE were no match for Cornwallis and could do little more than keep their distance and shadow his movements. In July the British commander in chief, General HENRY CLINTON, began to send a series of contradictory orders to Cornwallis. Clinton and Cornwallis had for some time had difficulty working together. Now Clinton sent Cornwallis reinforcements, then asked for them back, then told him to prepare to march

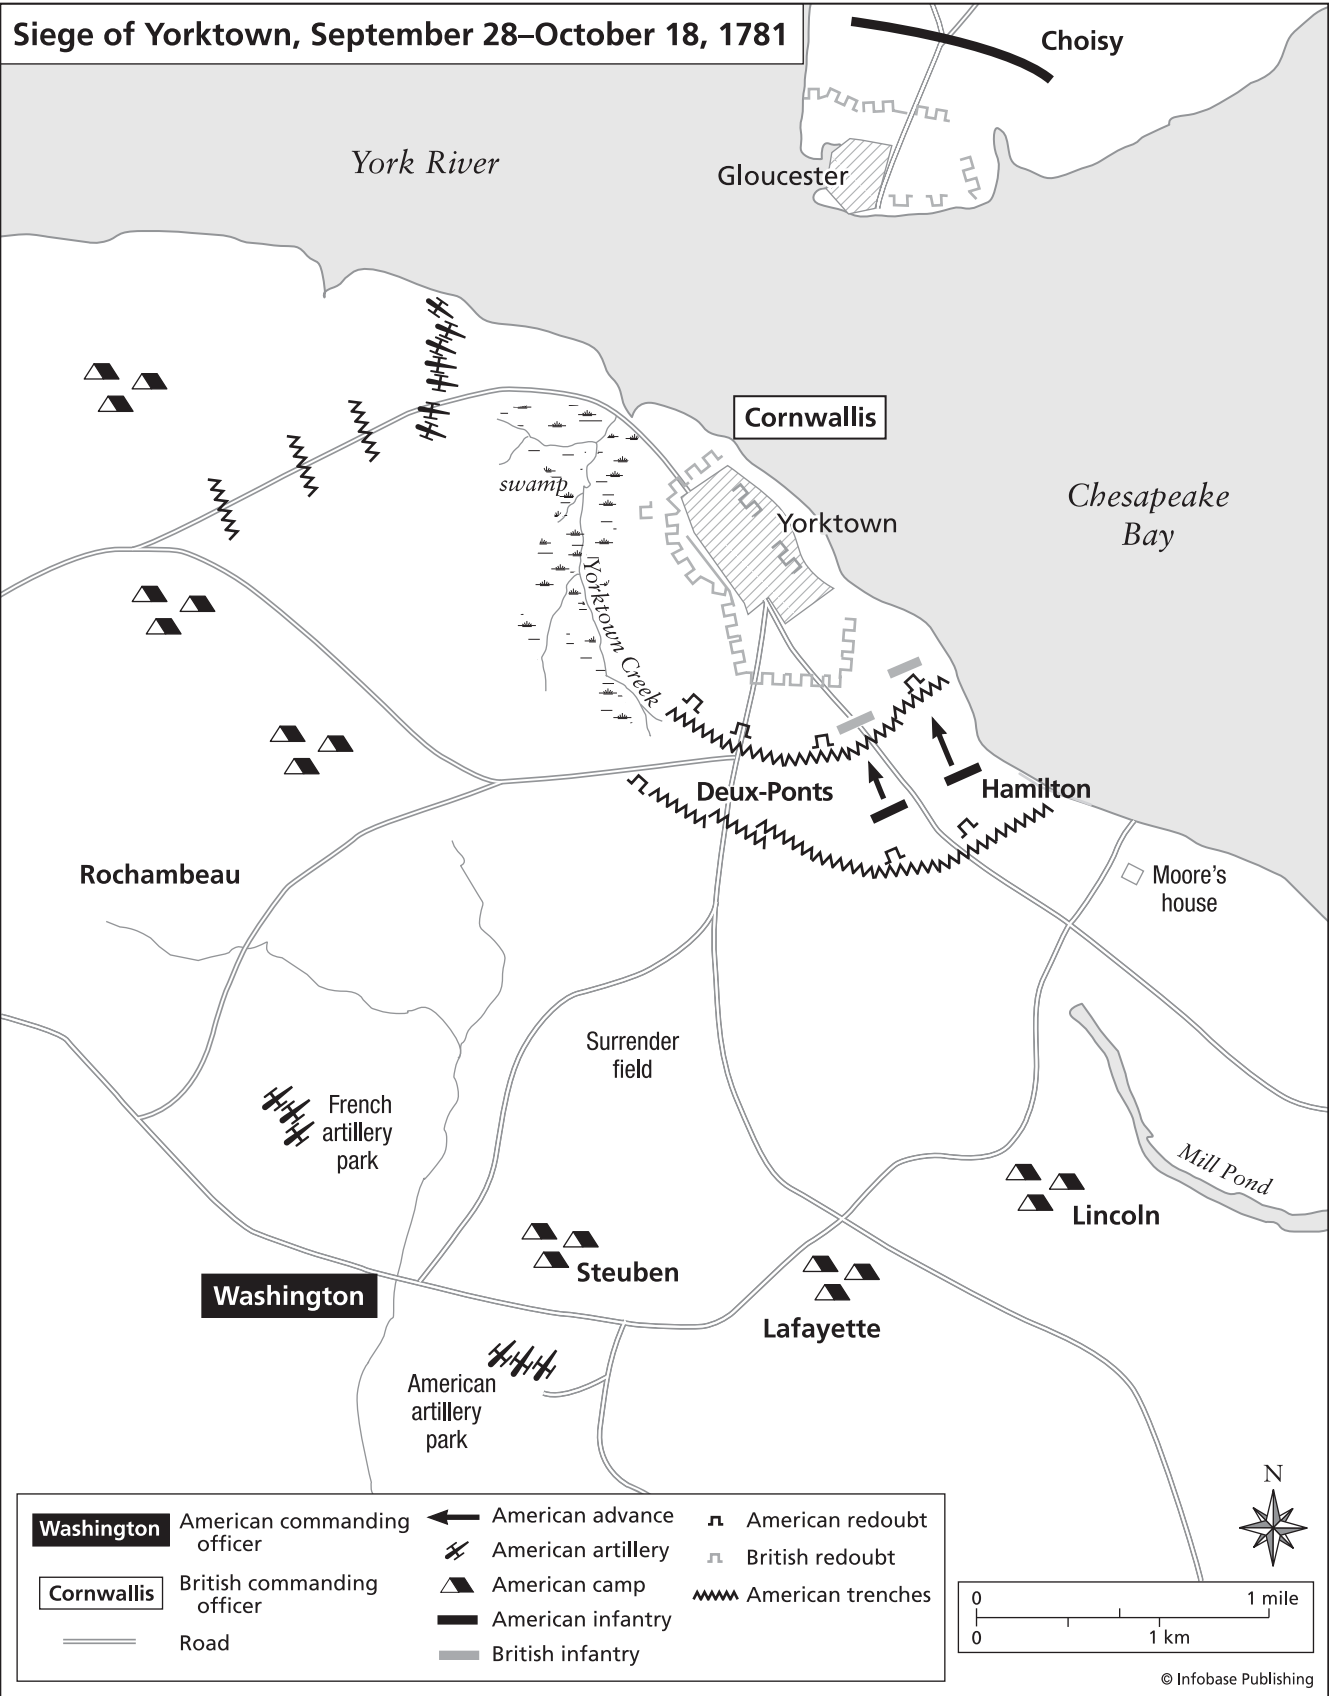

General Washington and the comte de Grasse surrounded British forces under General Cornwallis at Yorktown, leading to the eventual surrender of Cornwallis and a decisive victory for the Americans in their Revolution. (*U.S. Army Center of Military History*)

north to coordinate an attack on Philadelphia, then told him to occupy a town on the seacoast that could harbor the British navy. Cornwallis himself waffled, finally deciding to fortify a small tobacco port called Yorktown in August.

In the meantime General **GEORGE WASHINGTON** and the French commander General **COMTE DE ROCHAMBEAU** were planning an allied attack on New York City. That task began to look increasingly impossible in the summer of 1781. Then, on August 14, word arrived that the French fleet in the **WEST INDIES** under the command of Admiral **COMTE DE GRASSE** was going to sail to the Chesapeake. With the possibility of obtaining, however briefly, naval superiority, Washington decided to try to trap Cornwallis at Yorktown. The French ships arrived off the Chesapeake on August 30 but could stay in the area only to the end of October. In the meantime, the revolutionary and French armies began a complex maneuver, marching and sailing

their combined troops 400 miles south to the mouth of the Chesapeake Bay, while convincing Clinton that they still intended to attack New York. Washington, in particular, played a central role in planning this delicate operation. As the combined armies concentrated in southern Virginia in the first half of September, there was still the British fleet to worry about. Admiral Samuel Hood had left the West Indies in anticipation of de Grasse's move and had joined Admiral Thomas Graves in New York. This British naval force was roughly equal to the French. The British navy sallied forth and met de Grasse in the **BATTLE OF THE CAPES** (September 5, 1781), an indecisive contest. Although undefeated, the British ships returned to New York. The French headed back to the Chesapeake, sealing the fate of Cornwallis in Yorktown.

With half as many ground troops as the Franco-American armies, and boxed in by the French navy, Cornwallis was

trapped. He did little to help himself. The British did not attack the Continentals and French as they approached Yorktown. Then, confronted with an overwhelming force, Cornwallis withdrew his men from their first line of entrenchments, ceding the earthworks to his enemy and simplifying the siege process. On October 7, the allied troops began to build their first parallel—a series of trenches parallel to the British position. When that was completed, a second parallel was started on October 11 and finished on October 14. The Franco-American lines were then 300 yards from the British. To protect the parallel, two redoubts had to be taken; Continental troops, under Colonel ALEXANDER HAMILTON, captured Redoubt #10, while the French seized Redoubt #9 on the evening of October 14. With the parallels complete, the attackers poured a devastating artillery fire into the British. Cornwallis launched one counterattack on October 16, which had little success. On the same night, he attempted to cross the York River and escape, but bad weather forced him to abandon this last effort to save his army. On October 17, he asked for a parley, and the next day agreed to terms. During the siege the British lost 156 killed and more than 300 wounded. The revolutionary casualties were 20 killed and 56 wounded; the French had 52 killed and 134 wounded. On October 19, 1781, the British force of more than 8,000 soldiers and sailors surrendered.

Ketchum, *Victory at Yorktown: The Campaign That Won the Revolution* (New York: Henry Holt, 2004); Willard M. Wallace, *Appeal to Arms: A Military History of the American Revolution* (New York: Harper, 1951).

**Young, Thomas** (1731–1777) *doctor, orator*

Emerging from obscure origins in the colony of New York, Thomas Young was a strident revolutionary who had a major impact on the RESISTANCE MOVEMENT (1764–75) in Albany and Boston, and he also played a leading role in the radical politics of Pennsylvania and Vermont in the opening years of the REVOLUTIONARY WAR (1775–83)

Young managed to gain a medical EDUCATION and set himself up as a physician in Dutchess County, New York, by 1753. He bought land in what is now Vermont sometime around 1760, but he lost the investment because of a faulty title. He moved to Albany in the mid-1760s, and became involved in the opposition to the STAMP ACT (1765). He then moved to Boston and again became a leader against British imperial regulation. He delivered the first oration commemorating the anniversary of the BOSTON MASSACRE (March 5, 1770) and was active in Boston's COMMITTEE OF CORRESPONDENCE. He also spoke at the OLD SOUTH CHURCH shortly before the BOSTON TEA PARTY (December 16, 1773) and joined in the dumping of tea into the harbor. He left Boston in September of 1774 for Newport but moved to Philadelphia in April 1775. In Philadelphia he aligned with the radical party, helped to draw up the Pennsylvania state constitution, and in the spring of 1777, supported Vermont's bid for status as a state. As a part of his efforts on behalf of the GREEN MOUNTAIN BOYS, he provided a copy of the Pennsylvania constitution to the representatives from Vermont, who then used the democratic document as a model for their own constitution. Serving as a doctor tending to sick revolutionary soldiers, Young caught a fever and died almost impoverished on June 22, 1777.

See also CONSTITUTIONS, STATE.

# Chronology

---

## 1761

Boston attorney James Otis makes a legal argument denouncing the use of writs of assistance, which allow British customs officials to search property without obtaining a specific court order.

## 1763

The Treaty of Paris ends the French and Indian War. France cedes Canada and virtually all territory east of the Mississippi River in North America to Great Britain.

Chief Pontiac and his warriors attack Fort Detroit in a failed attempt to drive out the British.

King George III issues the Proclamation of 1763 to establish British colonies Quebec, East Florida, and West Florida and to protect Indian land west of the Appalachians from British settlement.

## 1764

Britain enacts the Sugar Act, which reduces the tax on British sugar imports but provides for better enforcement of tax collection. Colonists object to the law.

James Otis's *The Rights of the British Colonies Asserted and Proved* is published. The pamphlet asserts that the Sugar Act is inconsistent with natural law.

The British Currency Act of 1764 prohibits the printing and distribution of paper money in any of the 13 colonies.

## 1765

English law professor William Blackstone begins publishing *Commentaries on the Laws of England*. These lucid, widely available volumes lead to a democratization of the legal profession in the United States.

The British Parliament enacts the Stamp Act of 1765 in order to raise revenue to pay the costs of governing and protecting the American colonies; mobs in more than 40

American communities demonstrate against the tax, often compelling stamp masters to resign.

The Quartering Act of 1765 compels American colonists to provide housing for British soldiers where barracks are unavailable.

Daniel Dulany's pamphlet *Considerations on the Propriety of Imposing Taxes in the British Colonies* attacks the claim that colonial Americans are virtually represented in Parliament.

Led by Patrick Henry, the Virginia House of Burgesses passes the Virginia Resolves, which declare opposition to the Stamp Act and assert colonists' right to be governed and taxed by laws of their own choosing.

The Loyal Nine, a group of men from the middle ranks of Boston society, organize street resistance to the Stamp Act.

Representatives from nine American colonies participate in the Stamp Act Congress; the congress issues a petition to the king to voice colonist disapproval of the Stamp Act of 1765.

## 1766

Parliament repeals the Stamp Act but reserves the right to levy future taxes on British colonies.

## 1767

Daniel Boone begins to explore Kentucky.

Parliament imposes the Townshend Duties of 1767 to raise revenues from the North American colonies.

John Dickinson's *Letters from a Farmer in Pennsylvania* is published to object to the Townshend Duties.

Property holders in the frontier west of South Carolina respond to the region's lawlessness by organizing as the Regulators. This vigilante group attacks bandit encampments in the backcountry.

**1768**

Customs officials impound the *Liberty*, a sloop owned by Boston merchant John Hancock. Riots result and the British government decides to send troops to Boston.

The Massachusetts legislature issues a circular letter, written by Samuel Adams, to urge other American colonies to join in petitioning Parliament opposing the Townshend Duties.

British officials purchase lands in what will become West Virginia, Kentucky, and western Pennsylvania from the Iroquois Confederacy through the 1768 Treaty of Fort Stanwix.

**1769**

A nonimportation movement begins to take hold in the colonies in defiance of the Townshend Duties of 1767.

The American Philosophical Society is founded in Philadelphia.

**1770**

A series of confrontations between New York civilians and British soldiers culminates in a riot popularly known as the Battle of Golden Hill.

The Green Mountain Boys organize under Ethan Allen to resist New York authorities' efforts to enforce their land claims in Vermont territory.

Benjamin Rush publishes *Syllabus of a Course of Lectures in Chemistry*, a textbook that begins to formalize chemistry as an academic discipline.

Parliament rescinds the Townshend Duties except for the tax on tea.

British troops fire on a Boston crowd, killing five. The incident, known as the Boston Massacre, was a result of the tensions between soldiers and civilians over jobs and between the British Parliament and the American colonists following the passage of the Townshend Duties of 1767. Following the "massacre," Samuel Adams organizes the successful movement demanding the removal of British troops from Boston.

John Adams and Josiah Quincy serve as attorneys for the British soldiers accused of participating in the so-called Boston Massacre.

**1771**

At the behest of the North Carolina assembly, Governor William Tryon's troops crush the North Carolina Regulators, farmers who had been sporadically rioting since 1766 to protest oppressive local and colonial authorities, in the Battle of Alamance.

**1772**

A group of Providence merchants burn the British customs-enforcement schooner *Gaspée*.

Samuel Adams calls for the creation of committees of correspondence to coordinate anti-British resistance in Massachusetts and, ultimately, throughout the colonies.

**1773**

The Tea Act of 1773 permits the British East India Company to bypass middlemen and sell tea directly to colonial distributors in America, undermining the colonies' thriving traffic in smuggling. The act reduces the price on tea while leaving the Townshend Duties on tea intact.

The Boston Tea Party takes place: Citizens dump British tea into Boston Harbor to protest the Tea Act.

The poems of Phillis Wheatley are published in England.

**1774**

The Transylvania Company buys a large tract in Kentucky from the Cherokee Nation; Cherokee warrior Dragging Canoe refuses to recognize the sale and vows to kill any whites who settle the claim.

Religious leader Ann Lee migrates to the American colonies, where she founds Shaker societies.

Parliament passes the Coercive Acts in an effort to force colonists to recognize Parliament's sovereignty. Known in the colonies as the "Intolerable Acts," they consist of the Boston Port Bill, which closes the port; the Massachusetts Government Act, which curtails colonists' participation in local government; the Administration of Justice Act, which permits the Crown to choose the location of trials; and the Quartering Act, which compels colonists to pay for the housing of British soldiers enforcing these laws.

The Quebec Act of 1774 grants territory west of the Appalachians to Canada.

The First Continental Congress meets in Philadelphia to form a unified response to the Coercive Acts and assumes a supervisory role in Massachusetts's resistance.

Continental Congress unanimously endorses the Suffolk Resolves, which declare the Coercive Acts "murderous" and recommend economic sanctions against Great Britain.

Continental Congress unanimously approves an economic boycott of Great Britain, Ireland, and the West Indies. The congress forms the Continental Association to execute this "non-importation, non-consumption, and non-exportation agreement."

Continental Congress debates and approves a petition to King George III declaring colonists' rights and grievances.

Virginia royal governor John Murray, Lord Dunmore, defeats the Shawnee in Ohio Territory in Lord Dunmore's War.

Pennsylvania Quakers found the Pennsylvania Abolition Society, the first antislavery society in the colonies.

**1775**

As an agent of the Transylvania Company, Daniel Boone blazes the Wilderness Road and establishes the frontier community of Boonesborough.

Patrick Henry delivers his “Give Me Liberty” speech to members of the Second Virginia Convention.

Paul Revere, William Dawes, and others ride through the countryside around Boston to warn colonial minutemen of the approach of British troops.

The Revolutionary War begins as British soldiers clash with colonial minutemen at Lexington and Concord, Massachusetts.

The Committee of One Hundred organizes a provisional government for New York.

The Second Continental Congress, or Confederation Congress, convenes on May 10.

Benedict Arnold and Ethan Allen capture the British fort at Ticonderoga, New York.

Continental Congress names Virginian George Washington commander in chief of the Continental army.

Colonial forces resist British efforts to break the siege of Boston in the Battle of Bunker Hill.

King George III declares that the American colonies are in a state of open rebellion and authorizes the use of force to restore order.

Continental Congress founds the Continental navy.

The royal governor of Virginia, John Murray, Lord Dunmore, issues the Dunmore Proclamation, offering freedom for all slaves and servants who rally to the king's cause.

Benedict Arnold and General Richard Montgomery launch an attack on Montreal on December 31; a blizzard impedes their efforts and Montgomery is killed.

**1776**

Thomas Paine's *Common Sense*, an influential radical pamphlet against monarchy and tyranny, is published. It urges independence and formation of a republic.

Henry Knox brings cannons that were captured at Ticonderoga to Boston.

Faced with entrenched American forces on Dorchester Heights, the British evacuate Boston.

Captain John Barry's *Lexington* captures the United States's first British prize, the HMS *Edward*.

The Virginia Constitutional Convention adopts the Virginia Bill of Rights, which later serves as the foundation of the United States Bill of Rights.

Continental Congress appoints a committee to draft the Declaration of Independence; it consists of Thomas Jefferson (writer), John Adams, Benjamin Franklin, Robert Livingston, and Roger Sherman. The Declaration is debated and signed. It asserts that the thirteen colonies are now “free and independent states.”

The Second Continental Congress appoints a committee to draft a plan of perpetual union; the result, the Articles of Confederation, is to be the new nation's first constitution.

The British win a resounding victory at the Battle of Long Island, nearly entrapping Washington's army.

Tadeusz Kościuszko, a Polish military engineer, joins the Continental army, lending his expertise to the American cause.

Washington crosses the Delaware River and captures a force composed of Hessian soldiers at the Battle of Trenton.

**1777**

Washington's army defeats British forces at the Battle of Princeton.

Benjamin Franklin goes to France to negotiate for a French alliance.

British forces under General William Howe defeat American forces under George Washington at the Battle of Brandywine. The British march into Philadelphia.

Iroquois forces under Chief Joseph Brant allied with the English attack frontier settlers.

British general John Burgoyne surrenders at Saratoga, New York.

The Second Continental Congress sends a draft of the first constitution of the United States, the Articles of Confederation, to each of the 13 original states.

Washington and his army endure a brutal winter at Valley Forge, Pennsylvania; Baron Frederick von Steuben arrives in America and helps train the Continental army.

**1778**

France becomes a formal ally of the United States.

General William Howe resigns command of the British armies in North America; General Henry Clinton becomes commander in chief.

Continental forces strike General Clinton's army at the indecisive Battle of Monmouth Courthouse. Mary Hays McCaully, or “Molly Pitcher,” performs services for the Revolutionary cause and enters American legend.

U.S. lieutenant colonel George Rogers Clark captures two British forts in the West.

**1779**

John Adams helps draft the Massachusetts state constitution, which later serves among James Madison's models in drafting the U.S. Constitution.

American forces under General John Sullivan invade Iroquois territory, burning crops and villages to destroy Iroquois's ability to make war.

Captain John Paul Jones, aboard the *Bonhomme Richard*, captures the British warship *Serapis*.

**1780**

The American Academy of Arts and Sciences is founded in Boston.

British forces under General Henry Clinton capture Charleston, South Carolina, costing Americans virtually the entire southern army.

The marquis de Lafayette convinces the French government to send 12 additional battalions to fight with Washington's army.

The plot of U.S. general Benedict Arnold to surrender West Point to the British is uncovered; he escapes to British lines.

Pennsylvania becomes the first state in the new union to adopt a gradual emancipation statute.

Robert Morris organizes the Bank of Pennsylvania with private investments to support the Continental army.

African-American Paul Cuffe and six other men petition the Massachusetts Legislature against taxing them without their consent.

Benedict Arnold, now allied with the British, attacks Virginia, capturing Richmond and destroying American supplies.

**1781**

American troops under General Daniel Morgan decisively defeat British forces under Colonel Banastre Tarleton at the Battle of Cowpens.

British general Charles, Lord Cornwallis defeats American forces at the Battle of Guilford Courthouse but sustains heavy casualties.

By June all 13 former colonies have ratified the first constitution of the United States, the Articles of Confederation.

Continental Congress charts the Bank of North America, directed by Robert Morris.

An estimated 16,000 Continental and French troops lay Siege to the British army under General Charles Cornwallis, numbering 7,250, at Yorktown, Virginia. Lord Cornwallis surrenders on October 19.

**1782**

Large numbers of British loyalists begin abandoning their homes in the United States for Canada and England; some 100,000 eventually leave the United States.

J. Hector St. John de Crèvecoeur publishes *Letters from an American Farmer*.

**1783**

Noah Webster publishes *The American Spelling Book*.

The Treaty of Paris of 1783, which officially ends the Revolutionary War, is signed. John Adams, John Jay, and Benjamin Franklin are the principal negotiators for the United States. The treaty cedes all Iroquois land to

the United States; returns Florida, in British hands since 1763, to Spain; expands U.S. territory to the Mississippi River and assures free Mississippi navigation; and promises fishing rights to Newfoundland and Nova Scotia.

The last British troops evacuate New York City, ending British occupation of its former colonies. George Washington stuns the world by resigning his commission and returning home to Mount Vernon.

John Trumbull embarks on his most productive period as an artist, painting more than 250 historical pictures commemorating the defining events of the Revolutionary War.

**1784**

Continental Congress selects New York City as the temporary capital of the United States.

The New York Manumission Society is founded.

Iroquois Indians surrender their lands west of Pennsylvania to the United States in the Treaty of Fort Stanwix of 1784.

**1785**

Thomas Jefferson replaces Benjamin Franklin as minister to France. John Adams is named minister to Britain.

Continental Congress passes the Land Ordinance of 1785 to outline a framework for the settlement of the Northwest Territory.

Algerians seize several U.S. merchant ships in the Mediterranean Sea.

**1786**

Thomas Jefferson pens the Virginia Statute of Religious Freedom, which is the first attempt to guarantee absolute religious liberty in the United States.

Shays's rebellion breaks out in Massachusetts when the state refuses to help debt-ridden farmers. The uprising is put down within a year.

Delegates from five states convene in Annapolis, Maryland, to consider federal regulation of commerce; Alexander Hamilton calls for a constitutional convention to be attended by all the states to amend the Articles of Confederation.

The Tammany Society is founded in New York City as a fraternal organization.

**1787**

Continental Congress passes the Northwest Ordinance of 1787, which states that the Northwest Territory will be divided into no fewer than three but no more than five new states. It prohibits slavery in the territory and establishes the process by which a territory becomes a state.

Royall Tylor's *The Contrast*, the first professionally produced American comedy, opens in New York City.

Meeting in Philadelphia to revise the Articles of Confederation, the delegates at the Constitutional Convention instead vote to create an entirely new form of government.

Edmund Randolph of Virginia presents the Virginia Plan, which places power into the hands of a strong centralized federal government, with representation proportional to each state's population.

The New Jersey Plan advocates a national government that does not infringe on the rights of individual states, with all states represented equally regardless of population.

Roger Sherman's "Connecticut Compromise" resolves the differences between the New Jersey Plan and the Virginia Plan.

The Great Compromise of 1787 counts five slaves as three people for the purpose of congressional representation.

The Constitutional Convention approves the Constitution of the United States.

Benjamin Franklin's influential essay "On the Constitution" is released to promote the recently drafted Constitution.

The *Federalist Papers*, 85 political essays written in support of the Constitution by Alexander Hamilton, John Jay, and James Madison, begin to appear in a New York newspaper under the pseudonym "Publius."

The Free African Society is founded.

## 1788

By summer nine of the 13 states have ratified the U.S. Constitution, giving it legal force.

## 1789

The Constitution takes effect on March 4, 1789; ballots of presidential electors are announced when the U.S. Congress formally convenes in April.

George Washington is inaugurated as the first president of the United States at Federal Hall in New York City on April 30. John Adams is sworn in as vice president.

Former slave Olaudah Equiano publishes his memoir *The Interesting Life of Olaudah Equiano*. It is the first published American slave narrative.

John Fenno publishes the pro-Federalist Party *Gazette of the United States*, the first U.S. newspaper founded solely as an organ of one political faction.

The Judiciary Act of 1789 establishes the structure of the judiciary branch.

## 1790

Maryland and Virginia grant a 10-mile square of land on the Potomac River to the federal government to be designated the District of Columbia, the new capital city.

Rhode Island merchant Moses Brown backs Samuel Slater's textile mill in Rhode Island; Slater's mill brings the Industrial Revolution to the United States.

The first federal census counts a population of nearly 4 million people.

## 1791

Benjamin Banneker, a black mathematician and astronomer, publishes his *Almanack and Ephemeris*.

A confederation of tribes under the leadership of Miami chief Little Turtle defeats General Arthur St. Clair in the Northwest Territory.

Benjamin Franklin's autobiography is published.

The United States admits Vermont as a state.

The First Bank of the United States begins operations. Democratic-Republicans oppose the bank, holding that the ability to charter corporations such as banks is exclusively a state's right.

William Bartram publishes his *Travels*, an illustrated naturalist study of the flora and fauna of North America.

Pierre-Charles L'Enfant designs the street plan and public buildings of the District of Columbia.

The first 10 amendments to the Constitution, known as the Bill of Rights, are adopted; they guarantee U.S. citizens certain basic freedoms.

## 1792

Stock speculation creates the first great financial panic to rock the new nation.

George Washington is elected to his second term as president of the United States.

## 1793

France declares war on Britain.

"Citizen" Edmond Genêt, ambassador of France, comes to the United States seeking American support for France in its war against Britain.

President Washington's Neutrality Proclamation declares the intent of the United States to maintain friendly relations with both Britain and France while the two countries are at war.

Eli Whitney invents the cotton gin; the machine makes it profitable to grow short-staple cotton, spurring the growth of slavery in the South.

The U.S. Supreme Court decision *Chisholm v. Georgia* upholds the right of a citizen to sue a state government in federal court.

The Fugitive Slave Law of 1793 permits the owner of a runaway slave or his agent to arrest and return the slave to captivity.

Benjamin Rush performs valuable services during a yellow fever epidemic in Philadelphia.

A group of Philadelphia citizens founds the first Democratic-Republican Society, and dozens of similar clubs soon begin around the country; these grassroots organizations are the first to oppose President Washington.

#### 1794

Methodist preacher Richard Allen forms the first separate African-American congregation.

The federal government commissions a series of super frigates to protect American merchant ships.

Settlement of the Northwest Territory (now the states of Ohio and Indiana) increases.

General Anthony Wayne defeats the Northwest Indian Confederation in the Battle of Fallen Timbers.

Richard Allen and Absalom Jones publish *A Narrative of the Proceedings of the Black People During the late Awful Calamity in Philadelphia* to admonish Philadelphia leadership for rumormongering against blacks.

Settlers in Pennsylvania wage the Whiskey Rebellion to protest the federal excise tax on liquor. President Washington musters 12,000 militiamen to quell the uprising.

Special envoy John Jay and British foreign minister William Grenville negotiate Jay's Treaty of 1794 to resolve tensions between the United States and Great Britain. Britain agrees to remove troops from America's western territories, pay reparations to American merchants, and permit limited American trade in the West Indies, while the United States grants the British trading rights.

#### 1795

In the Greenville Treaty of 1795 the Native Americans of Ohio end their war against the United States, cede half of what is now Ohio to the U.S. government, and agree to move westward.

In the Treaty of San Lorenzo, Spain grants the United States free navigation of the Mississippi River, access to New Orleans, and a favorable Florida boundary.

The Naturalization Act of 1795 allows free white immigrants to apply for U.S. citizenship after five years of residence.

#### 1796

English physician Edward Jenner improves inoculation against smallpox using a weakened form of cowpox.

Gilbert Stuart paints his most famous portrait of George Washington.

Philadelphia's *American Daily Advertiser* prints President Washington's farewell address. This influential statement recommends a policy of political isolation from Europe and warns Americans to be wary of political parties.

The Federalist Party's John Adams is elected as the nation's second president.

#### 1797

French anger over the Jay's Treaty leads to an undeclared naval war known as the Quasi-War of 1798–1800. The situation is further complicated by an implied request by France for cash bribes to accept U.S. diplomatic officials. The incident becomes known as the XYZ affair.

John Trumbull completes his most famous painting, *The Declaration of Independence*.

#### 1798

U.S. Congress passes the Eleventh Amendment to the U.S. Constitution, prohibiting citizens of one state from suing the government of another.

The Naturalization Act of 1798 changes the necessary period of residence before citizenship is granted from five to 14 years.

Federalists in U.S. Congress enact the Alien Act of 1798, the Alien Enemies Act of 1798, and the Sedition Act of 1798, all of which give the U.S. government broad abilities to punish treasonable activities and deport foreigners.

The Democratic-Republican led legislatures of Kentucky and Virginia react to the Alien and Sedition Acts by declaring that federal legislation operates only with the consent of the states.

#### 1799

The federal government's direct tax on land prompts violent protest in eastern Pennsylvania, culminating in Fries's Rebellion.

Leading free black Philadelphians, including Absalom Jones, Richard Allen, and James Forten, unsuccessfully petition Congress to halt the slave trade.

#### 1800

Gabriel's Rebellion, a planned uprising of 1,000 blacks in Richmond, is foiled by informers and a massive rainstorm.

The Franco-American Convention of 1800 ends the undeclared naval war (the Quasi-War) precipitated by French attacks on U.S. commercial vessels. There, Napoleon agrees that the French alliance of 1778 is no longer binding.

Washington, D.C., becomes the capital of the United States.

The Democratic-Republican candidate, Thomas Jefferson, defeats the incumbent Federalist Party candidate, John Adams, in the presidential election. Political parties dominate a presidential contest for the first time; the result is the first peaceful transfer of power from one party to another.

#### 1801

John Marshall becomes chief justice of the U.S. Supreme Court.

The Judiciary Act of 1801 reorganizes the federal court system, giving President Adams the power to appoint 16 new federal judges, including the infamous “midnight judges,” before Thomas Jefferson is inaugurated.

At a demonstration of Eli Whitney’s mass production techniques for incoming president Thomas Jefferson, witnesses are able to assemble working muskets from random parts.

After the United States refuses to increase its tribute for protection from the Barbary States, Tripoli declares war on the United States.

Tent revivals inspire thousands of Americans in remote frontier regions to commit to Protestant faiths.

### 1803

The U.S. Supreme Court decides *Marbury v. Madison*, establishing the precedent of judicial review.

Thomas Jefferson signs the Louisiana Purchase Treaty, acquiring millions of acres of land from the French and putting a large population of Indians, including the Plains tribes, under U.S. jurisdiction.

William Clark and Meriwether Lewis begin a three-year expedition to explore the western territories that have been added to the United States.

The United States blockades Tripoli.

### 1804

Absalom Jones becomes the first black priest ordained by the Episcopal Church.

The Twelfth Amendment, which requires separate votes for president and vice president, is ratified.

The House of Representatives impeaches Supreme Court Justice Samuel Chase, a Federalist, for making partisan comments from the bench, but the Senate acquits him.

Tripoli captures the grounded USS *Philadelphia*; American sailors burn the ship in Tripoli harbor.

Aaron Burr and Alexander Hamilton duel at Weehawken, New Jersey, over Hamilton’s attacks on Burr’s reputation; Hamilton is mortally wounded.

Democratic-Republican Thomas Jefferson is reelected president over Charles Cotesworth Pinckney.

Following the Haitian slave revolt, Haiti becomes the first independent black republic in the Western Hemisphere. President Jefferson refuses diplomatic recognition of the nation.

### 1805

In the *Essex* decision, the British Admiralty Court rules that U.S. merchant ships must prove their neutrality to British maritime authorities.

A final peace treaty between Tripoli and the United States is signed aboard the USS *Constitution*.

Lewis and Clark’s “Corps of Discovery” reaches the Pacific Ocean.

### 1806

The Non-Importation Act of 1806 prohibits importing certain British goods.

Lewis and Clark reach St. Louis, Missouri, after a 28-month journey of exploration.

### 1807

The first commercially successful American steamboat, later known as the *Clermont*, travels up the Hudson River from New York City to Albany. It was built by Robert Fulton.

U.S. Congress passes the Slave Trade Abolition Act of 1807, which outlaws the African slave trade.

The British ship HMS *Leopard* fires on the USS *Chesapeake* just outside Chesapeake Bay.

Scandal erupts when the plan of former U.S. vice president Aaron Burr to either form an independent republic in the Southwest or invade Spanish territory becomes public. He is accused of treason but acquitted by Chief Justice John Marshall.

The Embargo Act of 1807 prohibits all international trade from U.S. ports. Intended to counteract British and French legislation that is disrupting U.S. commercial activity, the act proves devastating to the economy.

### 1808

The fur trading industry flourishes; John Jacob Astor establishes the American Fur Company Inc., which expands to the West.

Helped by his brother Tecumseh, Tenskwatawa, known as the Shawnee Prophet, establishes Prophetstown in Indiana Territory as a traditionalist spiritual enclave for Native Americans.

The Union Temperance Society of Moreau and Northumberland is founded. It is the first formal temperance group in the United States.

Democratic-Republican James Madison wins the presidential race against Federalist Charles Cotesworth Pinckney of the Federalist Party.

### 1809

The Non-Intercourse Act of 1809 repeals the Embargo Act of 1807 and restores international trade with all nations except France and Great Britain.

### 1810

The Macon Act of 1810, or Macon’s Bill No. 2, restores U.S. trade with France and Great Britain but promises to resume nonintercourse with one power if the other lifts its trade constraints.

*Fletcher v. Peck* declares a Georgia state law void under the U.S. Constitution. It is the first ruling to nullify a state law.

Elkanah Watson organizes the first agricultural fair, beginning the rural American tradition of the county fair.

**1811**

Construction of the National Road begins in Cumberland, Maryland. The road will facilitate European-American settlement west of the Appalachians.

Tecumseh calls for a confederation of Native American tribes to forcibly resist white settlement of western lands.

William Henry Harrison defeats a confederation of Native American forces led by Tenskwatawa in the Battle of Tippecanoe in Indiana Territory.

By a narrow margin, Congress votes against rechartering the First Bank of the United States.

**1812**

In response to British attacks on U.S. shipping, Congress declares war on Britain; the conflict is known as the War of 1812.

Indian leaders Tecumseh and Black Hawk ally their forces with the British, conducting raids on U.S. settlements.

James Madison is reelected to the presidency.

On President Madison's orders, General William Hull attempts an invasion of Canada; the attack fails and Hull surrenders Detroit to the British.

## **The Declaration of Independence (A Transcription from the National Archives)**

IN CONGRESS, July 4, 1776.

### **The unanimous Declaration of the thirteen united States of America,**

When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the Powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.—Such has been

the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.

He has refused his Assent to Laws, the most wholesome and necessary for the public good.

He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them.

He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.

He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.

He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands.

He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary powers.

He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of New Offices, and sent hither swarms of Officers to harrass our people, and eat out their substance.

He has kept among us, in times of peace, Standing Armies without the Consent of our legislatures.

He has affected to render the Military independent of and superior to the Civil power.

He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation:

For Quartering large bodies of armed troops among us:

For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States:

For cutting off our Trade with all parts of the world:

For imposing Taxes on us without our Consent:

For depriving us in many cases, of the benefits of Trial by Jury:

For transporting us beyond Seas to be tried for pretended offences.

For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:

For taking away our Charters, abolishing our most valuable Laws, and altering fundamentally the Forms of our Governments:

For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated Government here, by declaring us out of his Protection and waging War against us.

He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.

He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.

He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands.

He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions.

In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people.

Nor have We been wanting in attentions to our British brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which, would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.

We, therefore, the Representatives of the united States of America, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare,

That these United Colonies are, and of Right ought to be Free and Independent States; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do. And for the support of this Declaration, with a firm reliance on the protection of divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

**The Articles of Confederation**

***Agreed to by Congress November 15, 1777; ratified and in force, March 1, 1781***

James D. Richardson, ed. *A Compilation of the Messages and-Papers of the Presidents, 1789–1897*. Vol. 1 (Washington, D.C.: 1898), p. 9 ff.

To ALL TO WHOM these Presents shall come, we the undersigned Delegates to the States affixed to our Names send greeting. Whereas the Delegates of the United States of American in Congress assembled did on the fifteenth day of November in the Year of our Lord One Thousand Seven Hundred and Seventy seven, and in the Second Year of the Independence of America agree to certain articles of Confederation and perpetual Union between the States of Newhampshire, Massachusetts-bay, Rhodeisland and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North-Carolina, South-Carolina and Georgia in the Words following, viz. “Articles of Confederation and perpetual Union between the

states of New-hampshire, Massachusetts-bay, Rhodeisland and Providence Plantations, Connecticut, New-York, New-Jersey, Pennsylvania, Delaware, Maryland, Virginia, North-Carolina, South-Carolina and Georgia.

Art. I. The Stile of this confederacy shall be "The United States of America."

Art. II. Each state retains its sovereignty, freedom and independence, and every Power, Jurisdiction and right, which is not by this confederation expressly delegated to the United States, in Congress assembled.

Art. III. The said states hereby severally enter into a firm league of friendship with each other, for their common defence, the security of their Liberties, and their mutual and general welfare, binding themselves to assist each other, against all force offered to, or attacks made upon them, or any of them, on account of religion, sovereignty, trade, or any other pretence whatever.

Art. IV. The better to secure and perpetuate mutual friendship and intercourse among the people of the different states in this union, the free inhabitants of each of these states, paupers, vagabonds and fugitives from Justice excepted, shall be entitled to all privileges and immunities of free citizens in the several states; and the people of each state shall have free ingress and regress to and from any other state, and shall enjoy therein all the privileges of trade and commerce, subject to the same duties, impositions and restrictions as the inhabitants thereof respectively, provided that such restriction shall not extend so far as to prevent the removal of property imported into any state, to any other state of which the Owner is an inhabitant; provided also that no imposition, duties or restriction shall be laid by any state, on the property of the united states, or either of them.

If any Person guilty of, or charged with treason, felony, or other high misdemeanor in any state, shall flee from Justice, and be found in any of the united states, he shall upon demand of the Governor or executive power, of the state from which he fled, be delivered up and removed to the state having jurisdiction of his offence.

Full faith and credit shall be given in each of these states to the records, acts and judicial proceedings of the courts and magistrates of every other state.

Art. V. For the more convenient management of the general interests of the united states, delegates shall be annually appointed in such manner as the legislature of each state shall direct, to meet in Congress on the first Monday in November, in every year, with a power reserved to each state, to recal its delegates, or any of them, at any time within the year, and to send others in their stead, for the remainder of the Year.

No state shall be represented in Congress by less than two, nor by more than seven Members; and no person shall be capable of being a delegate for more than three years in

any term of six years; nor shall any person, being a delegate, be capable of holding any office under the united states, for which he, or another for his benefit receives any salary, fees or emolument of any kind.

Each state shall maintain its own delegates in a meeting of the states, and while they act as members of the committee of the states.

In determining questions in the united states, in Congress assembled, each state shall have one vote.

Freedom of speech and debate in Congress shall not be impeached or questioned in any Court, or place out of Congress, and the members of congress shall be protected in their persons from arrests and imprisonments, during the time of their going to and from, and attendance on congress, except for treason, felony, or breach of the peace.

Art. VI. No state without the Consent of the united states in congress assembled, shall send any embassy to, or receive any embassy from, or enter into any conference, agreement, or alliance or treaty with any King, prince or state; nor shall any person holding any office of profit or trust under the united states, or any of them, accept of any present, emolument, office or title of any kind whatever from any king, prince or foreign state; nor shall the united states in congress assembled, or any of them, grant any title of nobility.

No two or more states shall enter into any treaty, confederation or alliance whatever between them, without the consent of the united states in congress assembled, specifying accurately the purposes for which the same is to be entered into, and how long it shall continue.

No state shall lay any imposts or duties, which may interfere with any stipulations in treaties, entered into by the united states in congress assembled, with any king, prince or state, in pursuance of any treaties already proposed by congress, to the courts of France and Spain.

No vessels of war shall be kept up in time of peace by any state, except such number only, as shall be deemed necessary by the united states in congress assembled, for the defence of such state, or its trade; nor shall any body of forces be kept up by any state, in time of peace, except such number only, as in the judgment of the united states, in congress assembled, shall be deemed requisite to garrison the forts necessary for the defence of such state; but every state shall always keep up a well regulated and disciplined militia, sufficiently armed and accoutred, and shall provide and constantly have ready for use, in public stores, a due number of field pieces and tents, and a proper quantity of arms, ammunition and camp equipage.

No state shall engage in any war without the consent of the united states in congress assembled, unless such state be actually invaded by enemies, or shall have received certain advice of a resolution being formed by some nation of Indians to invade such state, and the danger is so imminent

as not to admit of a delay, till the united states in congress assembled can be consulted: nor shall any state grant commissions to any ships or vessels of war, nor letters of marque or reprisal, except it be after a declaration of war by the united states in congress assembled, and then only against the kingdom or state and the subjects thereof, against which war has been so declared, and under such regulations as shall be established by the united states in congress assembled, unless such state be infested by pirates, in which case vessels of war may be fitted out for that occasion, and kept so long as the danger shall continue, or until the united states in congress assembled shall determine otherwise.

Art. VII. When land-forces are raised by any state for the common defence, all officers of or under the rank of colonel, shall be appointed by the legislature of each state respectively by whom such forces shall be raised, or in such manner as such state shall direct, and all vacancies shall be filled up by the state which first made the appointment.

Art. VIII. All charges of war, and all other expences that shall be incurred for the common defence or general welfare, and allowed by the united states in congress assembled, shall be defrayed out of a common treasury, which shall be supplied by the several states, in proportion to the value of all land within each state, granted to or surveyed for any Person, as such land and the buildings and improvements thereon shall be estimated according to such mode as the united states in congress assembled, shall from time to time direct and appoint. The taxes for paying that proportion shall be laid and levied by the authority and direction of the legislatures of the several states within the time agreed upon by the united states in congress assembled.

Art. IX. The united states in congress assembled, shall have the sole and exclusive right and power of determining on peace and war, except in the cases mentioned in the sixth article—of sending and receiving ambassadors—entering into treaties and alliances, provided that no treaty of commerce shall be made whereby the legislative power of the respective states shall be restrained from imposing such imposts and duties on foreigners, as their own people are subjected to, or from prohibiting the exportation or importation of any species of goods or commodities whatsoever—of establishing rules for deciding in all cases, what captures on land or water shall be legal, and in what manner prizes taken by land or naval forces in the service of the united states shall be divided or appropriated—of granting letters of marque and reprisal in times of peace—appointing courts for the trial of piracies and felonies committed on the high seas and establishing courts for receiving and determining finally appeals in all cases of captures, provided that no member of congress shall be appointed a judge of any of the said courts.

The united states in congress assembled shall also be the last resort on appeal in all disputes and differences now

subsisting or that hereafter may arise between two or more states concerning boundary, jurisdiction or any other cause whatever; which authority shall always be exercised in the manner following. Whenever the legislative or executive authority or lawful agent of any state in controversy with another shall present a petition to congress, stating the matter in question and praying for a hearing, notice thereof shall be given by order of congress to the legislative or executive authority of the other state in controversy, and a day assigned for the appearance of the parties by their lawful agents, who shall then be directed to appoint by joint consent, commissioners or judges to constitute a court for hearing and determining the matter in question: but if they cannot agree, congress shall name three persons out of each of the united states, and from the list of such persons each party shall alternately strike out one, the petitioners beginning, until the number shall be reduced to thirteen; and from that number not less than seven, nor more than nine names as congress shall direct, shall in the presence of congress be drawn out by lot, and the persons whose names shall be commissioners or judges, to hear and finally determine the controversy, so always as a major part of the judges who shall hear the cause shall agree in the determination: and if either party shall neglect to attend at the day appointed, without shewing reasons, which congress shall judge sufficient, or being present shall refuse to strike, the congress shall proceed to nominate three persons out of each state, and the secretary of congress shall strike in behalf of such party absent or refusing; and the judgment and sentence of the court to be appointed, in the manner before prescribed, shall be final and conclusive; and if any of the parties shall refuse to submit to the authority of such court, or to appear to defend their claim or cause, the court shall nevertheless proceed to pronounce sentence, or judgment, which shall in like manner be final and decisive, the judgment or sentence and other proceedings being in either case transmitted to congress, and lodged among the acts of congress for the security of the parties concerned: provided that every commissioner, before he sits in judgment, shall take an oath to be administered by one of the judges of the supreme or superior court of the state, where the cause shall be tried, “well and truly to hear and determine the matter in question, according to the best of his judgment, without favour, affection or hope of reward:” provided also that no states shall be deprived of territory for the benefit of the united states.

All controversies concerning the private right of soil claimed under different grants of two or more states, whose jurisdictions as they may respect such lands, and the states which passed such grants are adjusted, the said grants or either of them being at the same time claimed to have originated antecedent to such settlement of jurisdiction, shall on the petition of either party to the congress of

the united states, be finally determined as near as may be in the same manner as is before prescribed for deciding disputes respecting territorial jurisdiction between different states.

The united states in congress assembled shall also have the sole and exclusive right and power of regulating the alloy and value of coin struck by their own authority, or by that of the respective states—fixing the standard of weights and measures throughout the united states—regulating the trade and managing all affairs with the Indians, not members of any of the states, provided that the legislative right of any state within its own limits be not infringed or violated—establishing and regulating post-offices from one state to another, throughout all the united states, and exacting such postage on the papers passing thro' the same as may be requisite to defray the expenses of the said office—appointing all officers of the land forces, in the service of the united states, excepting regimental officers—appointing all the officers of the naval forces, and commissioning all officers whatever in the service of the united states.—making rules for the government and regulation of the said land and naval forces, and directing their operations.

The united states in congress assembled shall have authority to appoint a committee, to sit in the recess of congress, to be denominated “A Committee of the States,” and to consist of one delegate from each state; and to appoint such other committees and civil officers as may be necessary for managing the general affairs of the united states under their direction—to appoint one of their number to preside, provided that no person be allowed to serve in the office of president more than one year in any term of three years; to ascertain the necessary sums of Money to be raised for the service of the united states, and to appropriate and apply the same for defraying the public expences—to borrow money, or emit bills on the credit of the united states, transmitting every half year to the respective states an account of the sums of money so borrowed or emitted—to build and equip a navy—to agree upon the number of land forces, and to make requisitions from each state for its quota, in proportion to the number of white inhabitants in such state; which requisition shall be binding, and thereupon the legislature of each state shall appoint the regimental officers, raise the men and cloath, arm and equip them in a soldier like manner, at the expence of the united states, and the officers and men so cloathed, armed and equipped shall march to the place appointed, and within the time agreed on by the united states in congress assembled: But if the united states in congress assembled shall, on consideration of circumstances judge proper that any state should not raise men, or should raise a smaller number than its quota, and that any other state should raise a greater number of men than the quota thereof, such extra number shall be raised, officered, cloathed, armed and equipped in the

same manner as the quota of such state, unless the legislature of such state shall judge that such extra number cannot be safely spared out of the same, in which case they shall raise officer, cloath, arm and equip as many of such extra number as they judge can be safely spared. And the officers and men so cloathed, armed and equipped, shall march to the place appointed, and within the time agreed on by the united states in congress assembled.

The united states in congress assembled shall never engage in a war, nor grant letters of marque and reprisal in time of peace, nor enter into any treaties or alliances, nor coin money, nor regulate the value thereof, nor ascertain the sums and expences necessary for the defence and welfare of the united states, or any of them, nor emit bills, nor borrow money on the credit of the united states, nor appropriate money, nor agree upon the number of vessels of war, to be built or purchased, or the number of land or sea forces to be raised, nor appoint a commander in chief of the army or navy, unless nine states assent to the same: nor shall a question on any other point, except for adjourning from day to day be determined, unless by the votes of a majority of the united states in congress assembled.

The congress of the united states shall have power to adjourn to any time within the year, and to any place within the united states, so that no period of adjournment be for a longer duration than the space of six Months, and shall publish the Journal of their proceedings monthly, except such parts thereof relating to treaties, alliances or military operations as in their judgment require secrecy; and the yeas and nays of the delegates of each state on any question shall be entered on the Journal, when it is desired by any delegate; and the delegates of a state, or any of them, at his or their request shall be furnished with a transcript of the said Journal, except such parts as are above excepted, to lay before the legislatures of the several states.

Art. X. The committee of the states, or any nine of them, shall be authorised to execute, in the recess of congress, such of the powers of congress as the united states in congress assembled, by the consent of nine states, shall from time to time think expedient to vest them with; provided that no power be delegated to the said committee, for the exercise of which, by the articles of confederation, the voice of nine states in the congress of the united states assembled is requisite.

Art. XI. Canada acceding to this confederation, and joining in the measures of the united states, shall be admitted into, and entitled to all the advantages of this union: but no other colony shall be admitted into the same, unless such admission be agreed to by nine states.

Art. XII. All bills of credit emitted, monies borrowed and debts contracted by, or under the authority of congress, before the assembling of the united states, in pursuance of the present confederation, shall be deemed and considered

as a charge against the united states, for payment and satisfaction whereof the said united states, and the public faith are hereby solemnly pledged.

Art. XIII. Every state shall abide by the determinations of the united states in congress assembled, on all questions which by this confederation are submitted to them. And the Articles of this confederation shall be inviolably observed by every state, and the union shall be perpetual; nor shall any alteration at any time hereafter be made in any of them; unless such alteration be agreed to in a congress of the united states, and be afterwards confirmed by the legislatures of every state.

AND WHEREAS it hath pleased the Great Governor of the World to incline the hearts of the legislatures we respectively represent in congress, to approve of, and to authorize us to ratify the said articles of confederation and perpetual union. KNOW YE that we the under-signed del-

egates, by virtue of the power and authority to us given for that purpose, do by these presents, in the name and in behalf of our respective constituents, fully and entirely ratify and confirm each and every of the said articles of confederation and perpetual union, and all and singular the matters and things therein contained: And we do further solemnly plight and engage the faith of our respective constituents, that they shall abide by the determinations of the united states in congress assembled, on all questions, which by the said confederation are submitted to them. And that the articles thereof shall be inviolably observed by the states we respectively represent, and that the union shall be perpetual. In Witness whereof we have hereunto set our hands in Congress. Done at Philadelphia in the state of Pennsylvania the ninth Day of July in the Year of our Lord one Thousand seven Hundred and Seventy-eight, and in the third year of the independence of America.

## The Constitution of the United States

James D. Richardson, ed. *A Compilation of the Messages and-Papers of the Presidents, 1789–1897*, Vol. 1, (Washington, D.C., 1898–1906), p. 21 ff.

WE THE PEOPLE of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

### Art. I

Sec. 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Sec. 2. The House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

No Person shall be a Representative who shall not have attained to the Age of twenty five Years, and been seven Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State in which he shall be chosen.

Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons. The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to chuse three, Massachusetts eight, Rhode-Island and Providence Plantations one, Connecticut five, New-York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies.

The House of Representatives shall chuse their Speaker and other Officers; and shall have the sole Power of Impeachment.

Sec. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.

Immediately after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes. The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year, and of the third Class at the Expiration of the sixth Year, so that one third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, during the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments until the next Meeting of the Legislature, which shall then fill such Vacancies.

No Person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years a Citizens of the United States, and who shall not, when elected, be an Inhabitant of that State for which he shall be chosen.

The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the Office of President of the United States.

The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two thirds of the Members present.

Judgment in Cases of Impeachment shall not extend further than to removal from Office, and disqualification to hold and enjoy any Office of honor, Trust or Profit under the United States: but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law.

Sec. 4. The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by Law make or alter such Regulations, except as to the Places of chusing Senators.

The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

Sec. 5. Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do Business; but a smaller Number may adjourn from day to day, and

may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

Each House may determine the Rules of its Proceedings, punish its Members for disorderly Behaviour, and, with the Concurrence of two thirds, expel a Member.

Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the Desire of one fifth of those Present, be entered on the Journal.

Neither House, during the Session of Congress, shall, without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting.

Sec. 6. The Senators and Representatives shall receive a Compensation for their Services, to be ascertained by Law, and paid out of the Treasury of the United States. They shall in all Cases, except Treason, Felony and Breach of the Peace, be privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning from the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States which shall have been created, or the Emoluments whereof shall have been increased during such time; and no Person holding any Office under the United States, shall be a Member of either House during his Continuance in Office.

Sec. 7. All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other Bills.

Every Bill which shall have passed the House of Representatives and the Senate, shall, before it become a Law, be presented to the President of the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be reconsidered, and if approved by two thirds of that House, it shall become a Law. But in all such Cases the Votes of both Houses shall be determined by yeas and Nays, and the Names of the Persons voting for and against the Bill shall be entered on the Journal of each House respectively. If any Bill shall not be returned by the President within ten Days (Sundays

excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary (except on a question of Adjournment) shall be presented to the President of the United States; and before the Same shall take Effect, shall be approved by him, or being disapproved by him, shall be repassed by two thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill.

Sec. 8. The Congress shall have Power To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties, Imposts and Excises shall be uniform throughout the United States;

To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

To establish an uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

To establish Post Offices and post Roads;

To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

To constitute Tribunals inferior to the supreme Court;

To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

To provide and maintain a Navy;

To make Rules for the Government and Regulation of the land and naval Forces;

To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

To provide for organizing, arming, and disciplining, the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;

To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the Same shall be, for the Erection of Forts, Magazines, Arsenals, dock-Yards, and other needful Buildings;—And

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

Sec. 9. The Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or duty may be imposed on such Importation, not exceeding ten dollars for each Person.

The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.

No Bill of Attainder or ex post facto Law shall be passed.

No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken.

No Tax or Duty shall be laid on Articles exported from any State.

No Preference shall be given by any Regulation of Commerce or Revenue to the Ports of one State over those of another: nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time.

No Title of Nobility shall be granted by the United States: And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince or foreign State.

Sec. 10. No State shall enter into any Treaty, Alliance, or Confederation; grant Letters of Marque and Reprisal; coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing its inspection Laws: and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury of the United States; and all such Laws shall be subject to the Revision and Controul of the Congress.

No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of delay.

## Art. II

Sec. 1. The executive Power shall be vested in a President of the United States of America. He shall hold his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows

Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certify, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Votes shall be taken by States, the Representation from each State having one Vote; A quorum for this Purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain

two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the Same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be encreased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them.

Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation:—"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Sec. 2. The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the

President alone, in the Courts of Law, or in the Heads of Departments.

The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Sec. 3. He shall from time to time give to the Congress Information of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States.

Sec. 4. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

### Art. III

Sec. 1. The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behaviour, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

Sec. 2. The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens of another State;—between Citizens of different States,—between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.

In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact,

with such Exceptions, and under such Regulations as the Congress shall make.

The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

Sec. 3. Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on confession in open Court.

The Congress shall have Power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attained.

#### Art. IV

Sec. 1. Full Faith and Credit shall be given in each State to the Public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.

Sec. 2. The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States.

A Person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive Authority of the State from which he fled, be delivered up, to be removed to the State having Jurisdiction of the Crime.

No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

Sec. 3. New States may be admitted by the Congress into this Union; but no States shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

Sec. 4. The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

#### Art. V

The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year One thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate.

#### Art. VI

All Debts contracted and Engagements entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

#### Art. VII

The Ratification of the Conventions of nine States, shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

Done in Convention by the Unanimous Consent of the States present the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty seven and of the Independence of the United States of America the Twelfth. In witness whereof We have hereunto subscribed our Names,

Articles in addition to, and Amendment of the Constitution of the United States of America, proposed by Congress, and ratified by the Legislatures of the several States, pursuant to the fifth Article of the original Constitution.

[The first 10 amendments went into effect November 3, 1791.]

#### Art. I

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

#### Art. II

A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed.

#### Art. III

No Soldier shall, in time of peace be quartered in any house, without the consent of the Owner, nor in time of war, but in a manner to be prescribed by law.

#### Art. IV

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

#### Art. V

No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

#### Art. VI

In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been

committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the Assistance of Counsel for his defence.

#### **Art. VII**

In Suits at common law, where the value in controversy shall exceed twenty dollars the right of trial by jury shall be preserved and no fact tried by a jury, shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law.

#### **Art. VIII**

Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

#### **Art. IX**

The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

#### **Art. X**

The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

#### **Art. XI**

Jan. 8, 1798

The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by Citizens of another State, or by Citizens or subjects of any Foreign State.

#### **Art. XII**

Sept. 25, 1804

The Electors shall meet in their respective states, and vote by ballot for President and Vice-President, one of

whom, at least, shall not be an inhabitant of the same state with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate;—The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;—The person having the greatest number of votes for President, shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by states, the representation from each state having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the states, and a majority of all the states shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President.—The person having the greatest number of votes as Vice-President, shall be the Vice-President, if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

# About the Editors

**General Editor: Gary B. Nash** received a Ph.D. from Princeton University. He is director of the National Center for History in the Schools at the University of California, Los Angeles, where he teaches American history of the colonial and Revolutionary era. He is a published author of college and precollegiate history texts. Among his best-selling works are the coauthored *American People: Creating a Nation and Society* (Longman, 1998), now in its seventh edition; *American Odyssey: The U.S. in the Twentieth Century* (McGraw-Hill/Glencoe, 1999), now in its fourth edition; and *The Atlas of American History*, coauthored with Carter Smith (Facts On File, 2006).

Nash is an elected member of the Society of American Historians, the American Academy of Arts and Sciences, the American Antiquarian Society, and the American Philosophical Society. He has served as past president of the Organiza-

tion of American Historians in 1994–95 and was a founding member of the National Council for History Education. His latest books include *First City: Philadelphia and the Forging of Historical Memory* (University of Pennsylvania Press, 2002), *The Unknown American Revolution: The Unruly Birth of Democracy and the Struggle to Create America* (Viking, 2005), and *The Forgotten Fifth: African Americans in the Era of Revolution* (Harvard University Press, 2006).

**Volume Editor: Malcolm J. Rohrbough**, University of Iowa, holds a Ph.D. from the University of Wisconsin. He is the author of several books, including *Days of Gold: The California Gold Rush and the American Nation* (University of California Press, 1996), and is coeditor of a 10-volume history of the trans-Appalachian frontier published by Indiana University Press.

# Foreword

The Encyclopedia of American History series is designed as a handy reference to the most important individuals, events, and topics in U.S. history. In 10 volumes, the encyclopedia covers the period from the 15th century, when European explorers first made their way across the Atlantic Ocean to the Americas, to the present day. The encyclopedia is written for precollegiate as well as college students, for parents of young learners in the schools, and for the general public. The volume editors are distinguished historians of American history. In writing individual entries, each editor has drawn upon the expertise of scores of specialists. This ensures the scholarly quality of the entire series. Articles contributed by the various volume editors are uncredited.

This 11-volume encyclopedia of “American history” is broadly conceived to include the historical experience of the various peoples of North America. Thus, in the first volume, many essays treat the history of a great range of indigenous people before contact with Europeans. In the same vein, readers will find essays in the first several volumes that sketch Spanish, Dutch, and French explorers and colonizers who opened up territories for European settlement that later would become part of the United States. The venues and cast of characters in the American historical drama are thus widened beyond traditional encyclopedias.

In creating the eras of American history that define the chronological limits of each volume, and in addressing major topics in each era, the encyclopedia follows the architecture of *The National Standards for United States History, Revised Edition* (Los Angeles: National Center for History in the Schools, 1996). Mandated by the U.S. Congress, the national standards for U.S. history have been widely used by states and school districts in organizing curricular frameworks and have been followed by many other curriculum-building efforts.

Entries are cross-referenced, when appropriate, with *See also* citations at the end of articles. At the end of most entries, a listing of articles and books allows readers to turn to specialized sources and historical accounts. In each volume, an array of maps provide geographical context, while numerous illustrations help vivify the material covered in the text. A time line is included to provide students with a chronological reference to major events occurring in the given era. The selection of historical documents in the back of each volume gives students experience with the raw documents that historians use when researching history. A comprehensive index to each volume also facilitates the reader’s access to particular information.

In each volume, long entries are provided for major categories of American historical experience. These categories may include: African Americans, agriculture, art and architecture, business, economy, education, family life, foreign policy, immigration, labor, Native Americans, politics, population, religion, urbanization, and women. By following these essays from volume to volume, the reader can access what might be called a mini-history of each broad topic, for example, family life, immigration, or religion.

# Foreword to the Revised Edition

“History has to be rewritten in every generation because, although the past does not change, the present does,” writes Lord Christopher Hill, one of Great Britain’s most eminent historians. “Each generation asks new questions of the past, and finds new areas of sympathy as it re-lives different aspects of the experiences of its predecessors.” It is this understanding, that the pursuit of historical knowledge requires new research and new reflections on the past, that undergirds a revised and extended edition of the *Encyclopedia of American History*.

The individual volume editors of this revised edition have made important additions and revisions to the original edition published in 2003. Most important, they have added many new entries—several hundred for the entire 11-volume set. This puts more meat on the bone of what was already a comprehensive encyclopedia that presented four centuries of American history in all its diversity and complexity. For the 10th volume, covering the period from 1969 to the present, new entries cover momentous events and important figures of the last six years. For the other volumes, new entries increase the diversity of Americans covered by biographical accounts as well as events that new scholarship shows have had greater importance than recognized heretofore.

In addition, careful attention has been given to correcting occasional errors in the massive number of entries in the first edition. Also, many entries have been revised to add further details while making adjustments, based on new scholarship, to the interpretation of key events and movements. Consonant with that effort to make the encyclopedia as fresh and usable as possible, the volume editors have added many new recently published books to the “Further Reading” notes at the ends of the entries, and new full-color historical maps help put history in its geographical context.

—Gary B. Nash

# Introduction

---

★

In the 60 years from 1800 to the opening of the Civil War, the American nation expanded, matured, and divided. Expansion came first. It began in 1803 with Thomas Jefferson's purchase of the Louisiana Territory, and in 1819 the United States acquired the rest of Florida by treaty. Then, in the decade of the 1840s, with stunning suddenness amidst a burst of expansionist sentiment, the country extended its boundaries westward. The nation first annexed Texas (1845) as the 31st state, gained the Oregon Country by treaty (1846), and, after a war, seized the northern third of Mexico (1848), which would become the states of California, New Mexico, and Arizona. The Gadsden Purchase of 1854 would complete this expansion. At the conclusion of this growth, the United States had become a continental nation, stretching from the Atlantic to the Pacific.

At the same time that the United States expanded, and in part because of it, the civil contract of the nation and its political unity began to unravel. The issue of African slavery became the dominant theme of American political life. Opposition to the "peculiar institution" grew as the country expanded to the West. And the abolitionist movement, as it would be called, was only one of many reform movements that engaged the energies of men and women. Among the more important of these were women's rights and the temperance movement. These issues would continue to engage the nation through the Civil War and well into the 20th century.

# ENTRIES A TO Z

### abolition movement

Opposition to **SLAVERY** in America dates to the early years of European settlement, when small numbers of Quakers criticized the practice. Antislavery sentiment increased during the revolutionary period, when American protests against the “slavery” enforced by the English king made some question the morality of enslaving Africans in the colonies. After the American Revolution, antislavery sentiment grew, as the rhetoric of liberty influenced the way some Americans thought about owning other people. During the afterglow of victory, many southern slave owners freed their slaves in a spate of Revolutionary altruism, inspired by the Declaration of Independence, which held that “all men are created equal.” Hence, sizable populations of legally free blacks in Virginia, Maryland, and South Carolina flourished throughout the antebellum period.

In the northern states, where slaves were fewer in number and less essential to the **ECONOMY**, abolitionist societies began to form in 1775. These societies successfully lobbied for abolition in the state legislatures of the North. By 1800, most northern states had abolished slavery—either immediately or through gradual manumission (e.g., upon reaching a certain age, a slave would be freed). In the Northwest Ordinance of 1787, Congress prohibited carrying slaves into the Northwest Territory. In 1808, Congress outlawed the foreign slave trade. To antislavery activists, both of these measures seemed to point to the eventual dissolution of the slave economy.

Thus, with the successes of antislavery advocates in the North, many Americans thought that the slavery system was becoming untenable in the new land of liberty and would soon die out. But with the invention of the cotton gin and new opportunities for expansion into the Old Southwest, slave-centered **AGRICULTURE** flourished after 1800. Also, because the U.S. Constitution did not grant the federal government the power to regulate slavery, southern states maintained enormous power to defeat any antislavery measures proposed in their state legislatures. Antislavery groups

had effected change in the northern states where most of their members lived, but these groups had little influence in the South. Without an obvious way to combat slavery in the South, abolition societies became less powerful and lost momentum. Around this time the domestic or internal slave trade also began to flourish, resulting in the transfer of nearly 1 million individuals from the Upper South to the Cotton Belt by 1860, along with the concomitant rise of a professional class of slave traders. The seemingly innocuous cotton gin had inadvertently granted slavery a new lease on life and with it the potential for meaningful profit. Thus, given the incessant demand for cheap labor to work new farmlands in the Old Southwest, the “peculiar institution” and its defenders became more entrenched than ever in the American polity.

But the conflict over slavery did not disappear. Indeed, as white Americans moved west, became property owners, and gained more political rights, the rhetoric of American liberty became ever more tied to ideas of white supremacy. Just as Indians were being removed from land to make way for white settlers, some also worried that the presence of free blacks was a danger to white liberty. The number of free blacks had increased since the Revolution, but they were ill-treated and denied the rights of citizens. The presence of free blacks was, therefore, a problem for a society that was supposed to provide equal opportunity. With this growing skepticism about whether blacks could ever be accepted as free American citizens, societies such as the **AMERICAN COLONIZATION SOCIETY** began to emerge in the 1810s. These groups advocated removing free blacks from American society and sending them back to Africa. Moreover, the movement had its own spokesman in the person of Baltimore Quaker Benjamin Lundy, who edited and published a weekly newspaper, *The Genius of Universal Emancipation*. Despite threats of violence and Lundy’s own near death at the hands of an enraged mob, his paper made eloquent pleas for gradual emancipation and colonization, and in 1829 he attracted

An engraving of an antislavery meeting on Boston Common showing free blacks among the crowd (*Library of Congress*)

the services of a young and idealistic Boston reporter, William Lloyd Garrison.

The motives of the colonizationists varied. Some whites supported colonization because they wanted to rid the nation of African people, whom they deemed unfit to live in a democracy. Some southern slave owners promoted the removal of free blacks, whom they considered a threat to their ability to control their slaves. Other whites were more sympathetic about the discrimination experienced by free blacks in the United States; they argued that blacks would be free from such racism if they returned to Africa. Other whites advocated colonization because they believed ex-slaves who returned to Africa could bring Christianity and European civilization to the continent. But all of these factions were doubtful about whether African Americans would ever be accepted by a white populace whose political identifications were increasingly racist. Fearing the social consequences of freeing a previously subject group, many argued that

removal was the only way to abolish slavery while preserving order.

Some free blacks also doubted whether they could ever prosper in America and supported colonization because they believed they would never be treated fairly if they stayed in the United States. They also thought that southern slave owners might be more likely to free their slaves if the ex-slaves were safely removed from threatening former masters. But many free blacks disagreed with the concept of colonization, arguing that blacks should stay in the United States to fight for their rights as citizens and to demand the abolition of slavery. Implicitly they argued that American identity was not race-specific, that African Americans had the capacity to be good citizens and the right to demand inclusion in the promise of American liberty. This more positive view of the purposes of abolition would grow as the movement focused more on inherent human equality.

The colonization movement was only moderately successful. The American Colonization Society (ACS) estab-

lished the West African colony of LIBERIA, and several thousand free blacks emigrated. But the removal plan was costly, impractical, and therefore affected very few African Americans. Also, the ACS was attacked by other reformers who saw colonization as a cynical strategy designed to appease slave owners and vilify blacks. Black leaders such as James Forten and David Walker accused the colonizationists of the same racism that made life so difficult for African Americans. In the 1820s new reform societies arose in opposition to colonization, thus laying the groundwork for the next phase of the abolition movement.

Anticolonizationists in the black communities of the North protested the influence of the ACS. They realized that in order to challenge the ACS, they needed to build a coalition with sympathetic whites. By the early 1830s a new radical kind of abolitionism was growing. These new abolitionists advocated an immediate end to slavery, based on the concept of universal human equality. "Immediatists" argued that slavery was such a great moral evil that it must be ended at once. The most prominent proponent of immediatism was William Lloyd Garrison, a white newspaper editor. Once a colonizationist, Garrison was greatly influenced by Forten, Walker, and other black leaders to become more radical in his approach. In 1831, he began publishing *The Liberator* in Boston. Most of his early subscribers were black, and many welcomed his commitment to the movement. It was politically expedient for the immediatists to put forth a white man as the leader of the movement, but Garrison was not alone. Many other black and white writers contributed to the magazine. Other sympathetic leaders emerged, such as the fiery lecturer THEODORE DWIGHT WELD and ARTHUR AND LEWIS TAPPAN, wealthy New York City merchants who were prominent in the evangelical movement. The charismatic influence of the immediatists converted many people who were previously attached to the colonization cause. In 1832 the New England Anti-Slavery Society was formed—the first such organization in the United States. The following year the AMERICAN ANTI-SLAVERY SOCIETY (AASS) was founded, a national group that combined efforts of the many local groups. By 1837 there were more than 500 local societies in northern states. Some of these societies were founded and operated by women—and were often interracial. Indeed, several women, such as ANGELINA AND SARAH GRIMKÉ, became outspoken leaders in the movement.

So what was the immediatist strategy? The mainstream movement could not advocate violent change and remain respectable. Nor could abolitionists campaign for federal action, since the Constitution gave the federal government no authority over state slavery laws. Thus, abolitionists hoped to change slave owners' minds through moral persuasion and indirect political pressure. As was the standard practice of many contemporary reform movements,

the abolitionists got their message across by public speaking tours, disseminating tracts, and selling subscriptions to antislavery periodicals. They attacked slavery as, first and foremost, a sin. They dismissed economic arguments as a distraction from the true cause: uplifting American society by eradicating the corrupting presence of slavery. Some abolitionists seemed more concerned with the endangered souls of slave owners than with the circumstances of the slaves themselves. But others, especially free black abolitionists, were primarily concerned with the liberation of enslaved black people. Whatever the emphasis, the strategy that evolved in the 1830s centered around convincing southern slave owners that abolition was morally right. If slave owners came to believe that they were committing a sin, they would voluntarily free their slaves.

But by the end of the 1830s it became clear that slave owners were not changing their ways, no matter which tactic the abolitionists employed. Tensions arose within the movement as well. The more conservative leaders, such as the Tappan brothers, protested the involvement of women on committees. In 1840 the AASS split into two organizations because of this dispute. Garrison, whose endorsement of women's rights and international pacifism finally caused a fissure, went on to control the new AMERICAN ANTI-SLAVERY SOCIETY, which functioned as the radical, extremist wing of abolitionist thinking in opposition to the newer, more mainstream American and Foreign Anti-Slavery Society of Lewis Tappan. Conservative abolitionists worried that Garrison and the radicals were too unconventional and controversial and would damage the respectability of the movement. This schism was the first of many splits among abolitionists, as the debate over slavery became increasingly high-pitched and volatile.

As the abolitionist movement and its message grew, so too did a campaign of organized violence against it in the North, usually orchestrated by ordinary laborers who feared economic competition from newly freed blacks. Their most celebrated victim, and the first abolitionist martyr, was ELIJAH LOVEJOY, a Princeton Theological Seminary graduate. He edited the *St. Louis Observer* for several years in Missouri, a slave state, until threats of violence induced him to close shop and relocate to Alton, Illinois. His cries for immediate emancipation met with derision and proved equally unpalatable in this new clime, hence his printing press was tossed into the Mississippi River by angry mobs on three occasions. Undaunted, Lovejoy received monetary support from the Ohio Anti-Slavery Society and purchased a fourth press. He then bravely weathered a spate of violent threats until November 7, 1837, when his office was stormed by a mob that finally killed him. His murder elicited increased sympathy and support for the movement throughout the North, although more out of concern for free speech than outright abolition. Yet mob violence

## 4 abolition movement

continued with little remission. Shortly after, Theodore Weld, a prominent speaker, was pelted by eggs during one gathering. Garrison himself was dragged down the streets of Boston with a rope around his neck and nearly lynched before authorities could rescue him. Political resistance to abolition also grew during this period and southerners in Congress forced adoption of the so-called Gag rule, which tabled any or all discussion of antislavery petitions between 1836 and 1844. They also convinced the government to ban all abolitionist newspapers and pamphlets from the southern mail. By 1840 the movement could only count on the support of men like JOHN QUINCY ADAMS of Massachusetts and Joshua Giddings of Ohio as the vast majority of politicians simply ignored abolitionists and their pleas. This complete lack of progress caused many within the movement to question and reevaluate the effectiveness of “moral suasion” as either an intellectual stance or a political tactic. It certainly spurred men like Garrison to adopt a harsher, more strident tone to their writings and public agitation, ultimately mixed results for the movement itself.

While Garrison was unwilling to compromise on the principle of human equality, some black abolitionists began to question the effectiveness of his “moral suasion” strategy. They began to formulate their own separate strategies, again centered on the right of slaves to revolt and take their freedom. The specter of black violence frightened many white abolitionists, who insisted that the movement could only succeed by seeming morally above reproach (and by being led by elite whites). It was clear by 1850 that not only had the abolitionists failed to transform southern slave society, but the plight of slaves had actually worsened. Southern politicians misused the federal authority over the mail in order to keep abolition material out of the South. In addition, the passage of harsher FUGITIVE SLAVE LAWS signaled a northern complicity with southern slavery that seemed catastrophic to abolitionists. Some black leaders began to see the situation as hopeless and revived the emigration solution. Some promoted emigration to Liberia, while others argued for going to Canada or Haiti.

Political opposition to slavery developed along several lines. The “Free-Soil” advocates in the new Republican Party viewed the slave system of labor as a threat to the liberty of all Americans because it endangered the ability of ordinary farmers and laborers to prosper. This kind of antislavery thought was centered more on the problems slavery created for whites than on the problems of slaves themselves. Only a minority of northerners opposed slavery because it was a racist system; most were persuaded to oppose slavery for other reasons: economic resentment of the South, a belief that slavery corrupted the spirit of liberty, concern about whether new territories would be slave or free. These reasons for being antislavery were connected to Garrison’s moral suasion argument, but they

were more about self-interest and less about social welfare. Many of the people who subscribed to antislavery politics in the 1850s were extremely prejudiced against blacks and not especially concerned about integrating freed slaves into American society.

When tensions over slavery and territorial expansion erupted into civil war, abolitionists were still a minority presence among Abraham Lincoln’s Republicans. They continued to push the administration to take a bolder stand on ending slavery. Many abolitionists enlisted in the Union army and encouraged the army to open its ranks to black soldiers. Others worked in army hospitals, and some traveled south, setting up services for freed slaves in Union-occupied areas (an endeavor that would continue with the Freedmen’s Bureaus and other educational efforts during Reconstruction).

Abolitionists felt a sense of triumph with the Union victory, and, most important, the passage of the Thirteenth Amendment, which abolished slavery. Judging that their work was done, some of the older abolition organizations like the AASS dissolved. Other abolitionists recognized the need to continue helping freed slaves by providing education and fighting for their legal rights. Indeed, the violent backlash against African Americans after Reconstruction troops withdrew pointed to the continuing relevance of the abolitionist cause. Some former abolitionists realized what freed blacks learned almost immediately—that achieving equality required more than simply changing the laws. Unfortunately, without abolition to mobilize around, reformers who were concerned about the plight of African Americans lost an easy rallying point after the Civil War.

The abolition cause was never embraced by the majority of Americans, nor did abolitionists possess the political power their southern opponents accused them of having. However, this small section of society did change the debate about slavery in 19th-century America. And in retrospect, they helped achieve the abolition of slavery in a relatively short period of time. As one of the first organized reform movements, the abolition cause has served as an example to 20th-century activists advocating civil rights.

**Adams, John Quincy** (1767–1848) *sixth U.S. president* Born in Braintree (now Quincy), Massachusetts on July 11, 1767, John Quincy Adams was the most gifted American diplomat during the early republic and later served as the sixth president of the United States. Adams was uniquely qualified for a life of public service. The son of the revolutionary leader John Adams and Abigail Adams, he was also a gifted and articulate supporter of the revolution.

John Quincy Adams received his earliest education from his parents. At the age of 10, the younger Adams accompanied his father on diplomatic missions to Europe. He became fluent in French and was educated in a private school in Paris and at the University of Leiden. In 1782–83 he served as secretary and interpreter for the American diplomat Francis Dana on a journey to the Russian court in St. Petersburg. They traveled by way of Holland, the German states, and Scandinavia. When Adams returned to the United States in 1785, age 18, he was extraordinarily well-traveled, an accomplished linguist, and well-read in the classics, history, and mathematics. He completed his education at Harvard College, graduating in 1787, then read law in Newburyport, Massachusetts under the supervision of Theophilus Parsons, a distinguished and conservative Massachusetts jurist. In 1790, he was admitted to the bar and settled down to practice law in Boston.

Like his father, Adams identified with the emerging Federalist Party. He came to the attention of President George Washington as the author of newspaper articles defending the administration's neutrality policies during the wars of the French Revolution (1789–1815). In consequence, Washington appointed the younger Adams as

the American minister to the Netherlands (1794–97). After serving in the Hague, Adams represented the United States at the Prussian court from 1797 to 1801. While on diplomatic business in London, he met and courted Louisa Catherine Johnson, daughter of Joshua Johnson, an American diplomat in Britain; they were married on July 26, 1797.

President John Adams recalled his son from Berlin after he lost the bitterly contested election of 1800, and the younger Adams returned to Boston to pursue his legal career. Public life continued to exert a pull on him, and in 1803 he was elected to represent Massachusetts in the U.S. Senate. Although a Federalist, Adams was independent-minded, and to the dismay of his party, he voted in support of the Jeffersonian embargo in 1807. Because of his independent stance, he was not reelected to the Senate, so he returned to Boston to resume his legal career and serve as Boylston professor of oratory and rhetoric at Harvard.

Adams's return to Massachusetts would be brief, as President James Madison appointed him the first American ambassador to Russia, a post he held from 1809 to 1814. He left the Russian court to act as the chief of the American mission at Ghent during the negotiations to end the WAR OF 1812 (1812–15). When the TREATY OF GHENT (1814) was concluded, Adams served as the American ambassador to Britain, a post his father had held 30 years before. He represented the United States in Britain from 1815 to 1817. (Between 1794 and 1817 Adams had represented the United States in the Netherlands, Prussia, Russia, and Great Britain. During that period he was an astute observer and reporter of the French Revolution and the Napoleonic Wars.)

President JAMES MONROE recalled Adams from London to serve as his secretary of state, a post Adams held from 1817 until 1825. Schooled in European ways and experienced in European affairs, Adams believed strongly that the United States should remain isolated from Europe's conflicts, articulating this view as the chief architect of the MONROE DOCTRINE. As secretary of state, Adams was responsible for negotiating the ADAMS-ONÍS TREATY, by which the United States acquired East and West FLORIDA and recognized the border of the United States as extending from the Gulf of Mexico to the Rocky Mountains and thence along the 42nd parallel to the Pacific Ocean. He also asserted that the border between Oregon and British Canada should run along the 49th parallel.

John Quincy Adams enjoyed a varied and successful career as lawyer, scholar, and diplomat until he ran for president in 1824. A crowded field of five candidates divided the popular vote. ANDREW JACKSON won the popular vote, but as no candidate had a majority in the electoral college, the election was thrown into the House of Representatives, and HENRY CLAY supported Adams to make the New

## 6 Adams-Onís Treaty

England president. His presidency, undermined from the beginning by the circumstances of his election, encountered much opposition. The Jacksonians attacked his presidency as an exercise in “bargain and corruption,” the term used to describe the charge that Adams and Clay colluded to cheat Jackson out of the office. Adams’s nationalist views and his reluctance to make use of patronage further hindered his four years in office. In 1828 he lost the election to Jackson.

Adams was 62 years old when he left the White House in 1829. Rather than retire to Quincy, he ran for Congress and represented Massachusetts in the House of Representatives from 1830 until his death in 1848. During this period, Adams emerged as an articulate and forceful opponent of slavery. He crusaded against the “gag rule” that forbade the House from considering antislavery petitions, and in 1844 the House repealed the rule. In 1841 Adams actively participated in the successful arguments before the Supreme Court over the legal status of a group of former African slaves who had revolted and seized the Spanish ship *Amistad*. He also vigorously opposed the annexation of Texas and the U.S. declaration of war against Mexico as attempts to expand the institution of slavery. He died at his desk in the House of Representatives on February 23, 1848.

### Adams-Onís Treaty (1819)

The Adams-Onís Treaty (or Transcontinental Treaty) of 1819 is significant in the expansion of the United States for adding the FLORIDA territory to the country at relatively little cost and for giving the United States its first internationally recognized claim to territory on the Pacific Ocean.

Spain had established its control of the territory of Florida, which included the entire Gulf of Mexico shore from the Mississippi River to the current state of Florida, in the early 16th century. In 1763 Spain was forced to cede control to England after being on the losing side in the Seven Years’ War, but the Treaty of Paris ending the American Revolution restored Spanish authority in Florida. After making the Louisiana Purchase in 1803, however, the United States slowly began to seize pieces of Florida from Spain. Settlers occupied the area around Baton Rouge in 1810, prompting its annexation to the United States. The

U.S. Army then occupied Mobile Bay and other parts of West Florida during the WAR OF 1812, ostensibly to keep those lands from falling into British hands. In 1818 General ANDREW JACKSON, on the pretext of fighting Seminole Indians who were raiding the southern United States from Florida, occupied much of the rest of the territory. Meanwhile, there was an ongoing dispute between the United States and Spain concerning the boundary of the Louisiana Purchase. The United States claimed that the Louisiana Purchase territory extended to the Rio Grande; the Spanish rejected this, asserting the Sabine River as the boundary.

Negotiated by Secretary of State JOHN QUINCY ADAMS with Luis de Onís, the Spanish ambassador in the United States, the Adams-Onís Treaty contained several provisions. First and foremost, the Spanish relinquished all claim to Florida. Additionally, the treaty settled the southwestern boundary of the Louisiana Purchase at the Sabine River. In exchange for the United States, accepting the Spanish interpretation of the Louisiana boundary, Spain relinquished its claims to the Oregon Territory in the Pacific Northwest, fixing the boundary between United States and Spanish territory on the Pacific coast at the 42nd parallel. Oregon remained disputed territory, however, as the United States and England had agreed to joint occupation in the Convention of 1818; the boundary between the United States and Canada in the Northwest would not be settled until the OREGON TREATY OF 1846. Finally, although the United States did not “buy” Florida from Spain, the Adams-Onís Treaty relieved the Spanish government of \$5 million worth of monetary claims made by American citizens against it. No actual money changed hands between the two countries.

The U.S. Senate readily ratified the treaty in 1819, though some criticism of Adams emerged for surrendering Texas when Onís might have been induced to cede that land as well. The Spanish, however, delayed ratification, hoping to secure a promise from the United States not to aid revolutions in Spanish colonies in Latin America. The United States demurred, and two years later, after Spain accepted the original treaty, the Senate ratified the treaty again on Washington’s birthday in 1821.

### African Americans

Throughout the antebellum period, African Americans were the nation’s largest racial minority bloc and by 1860

numbered close to 4 million individuals. The greatest concentration of blacks was in the South, where the majority of them were slaves, but no less than 488,070 were also legally free and resided in communities there and in the North. Practically speaking, there was little distinction between slave and free in terms of the treatment afforded African-American citizens, which, overall, was deplorable. Blacks in every part of the country were dogged by a racial hierarchy based upon widely held beliefs of European white superiority. These ideas, in the South at least, became a moral justification for slavery on the basis that it helped to “civilize” its charges. This deeply ingrained racial oppression did not end with the passing of the Civil War, but rather, simply transmuted itself into new forms under Reconstruction. Regardless, most blacks carved out a unique niche for themselves, with their own rituals, socialization patterns, and other adaptive mechanisms for coping with this essentially negative situation.

African-American men and women in the antebellum United States shared common experiences in their struggle for freedom. Despite disparate lives created by regional differences, labor patterns, religious beliefs, and legal sanctions, enslaved and free people alike fought an unending battle to define and possess their own liberty. Freedom was not simply the opposite of **SLAVERY**, nor did slavery mean the absolute absence of freedom. Liberty was experienced across a spectrum and won by deliberate and conscious action.

Most African Americans in the antebellum period were enslaved. After the abolition of the external slave trade in 1808, the majority of enslaved men and women were born in the country, rather than imported from Africa or other slaveholding nations in South America and the Caribbean. As slaves, men and women shared a common legal status. They were considered property, and as such could be willed, sold, and transported at the whim of their owners. For the purposes of the census and the legislative districting based on that count, slaves were considered three-fifths of a person. This guaranteed the South greater representation in Congress than if free people had been counted alone. Despite their importance to the business of legislative representation, however, enslaved men and women could not vote. They were rarely granted legal redress against physical or sexual abuse, and their marriages and families enjoyed no legal protection. Education, unsupervised religious meetings, large social gatherings, and the freedom to travel were all prohibited or restricted to some degree.

The experience of slavery did not simply depend on legal restrictions, however, but on the type of labor enslaved men and women were expected to perform. Most slaves worked in **AGRICULTURE**, raising cotton, rice, tobacco, indigo, and food crops on small farms.

Each crop demanded a different labor cycle. Tobacco required constant attention but facilitated a steady pace of work. Rice cultivation was a relentless process requiring that the crop be dried, buried, stacked, threshed, winnowed, and pounded by hand to transform it into a marketable good. Accidents were common from the complexity of the work and the exhaustion felt by those involved in production, while water-borne diseases were a constant hazard. Cotton cultivation required physical strength and endurance, especially during picking season, when an average enslaved man or woman was expected to pick between 150 and 200 pounds of cotton a day. The rhythms of each production cycle dictated how much time slaves had to spend on their own concerns, such as raising and tending their own gardens, maintaining their homes, performing chores, and enjoying each other's company. Hard labor also affected the life expectancy of each slave.

Not all slaves lived in rural communities, however, and urban slaves generally enjoyed greater freedom of movement, the chance to earn money from their labor, and the opportunity to acquire and perfect a marketable skill. Many urban slave owners allowed enslaved men and women to hire themselves out for wages in return for a weekly fee. Enslaved men often worked in construction, in skilled trades such as carpentry, at railroad terminals, and on docks. Women were sometimes employed as midwives, although they were more usually hired for domestic work. Urban enslaved men generally enjoyed greater freedom than enslaved women as they were less likely to work in a home under the direct and constant supervision of an owner or employer and had a greater range of jobs open to them.

This engraving shows a group of free blacks worshipping at an African-American church in Cincinnati, Ohio. (*Library of Congress*)

## 8 African Americans

All of these factors, however, constituted a range of expectations placed upon enslaved men and women by those outside the slave community. Slaves themselves took conscious action to carve out different liberties from the system that held them. While labor patterns were largely dictated by the industry in which slaves worked, those demands could be alleviated to a degree. Slaves broke tools and engaged in slowdowns in order to ease the pressure of the workday. Some slaves took more dramatic action, committing arson or sabotage in order to slow the pace at which tasks were performed. Throughout the 19th century, slaves ran away in order to gain their freedom or reunite with loved ones. There were also outright rebellions in which slaves violently resisted the demands of white southerners and attempted to secure their personal liberty and that of others.

On a day-to-day level, enslaved men and women resisted the attempts of outsiders to establish meaningful relationships and family life for them. While their status as slaves prevented them from entering into legally recognized contracts such as marriage, they formed such relationships, regardless of their legality, and solemnized them through local customs. Men and women enjoyed long and short-term sexual relationships and bore children who were raised, where and whenever possible, within a family unit. Even when parents were separated from one another, family ties remained extremely important, as demonstrated by the tireless attempts of many newly freed men and women to reunite with loved ones during and after the Civil War. The concept of family was, in and of itself, something that slaves negotiated in their own way. While mothers, fathers, and children were central to the concept of family, kinship was experienced and perpetuated in a much more expanded fashion, drawing in cousins, aunts, uncles, grandparents and friends. Family structures drew from African traditions as well as American models, and obligations extended beyond individual households to the community and neighborhoods beyond.

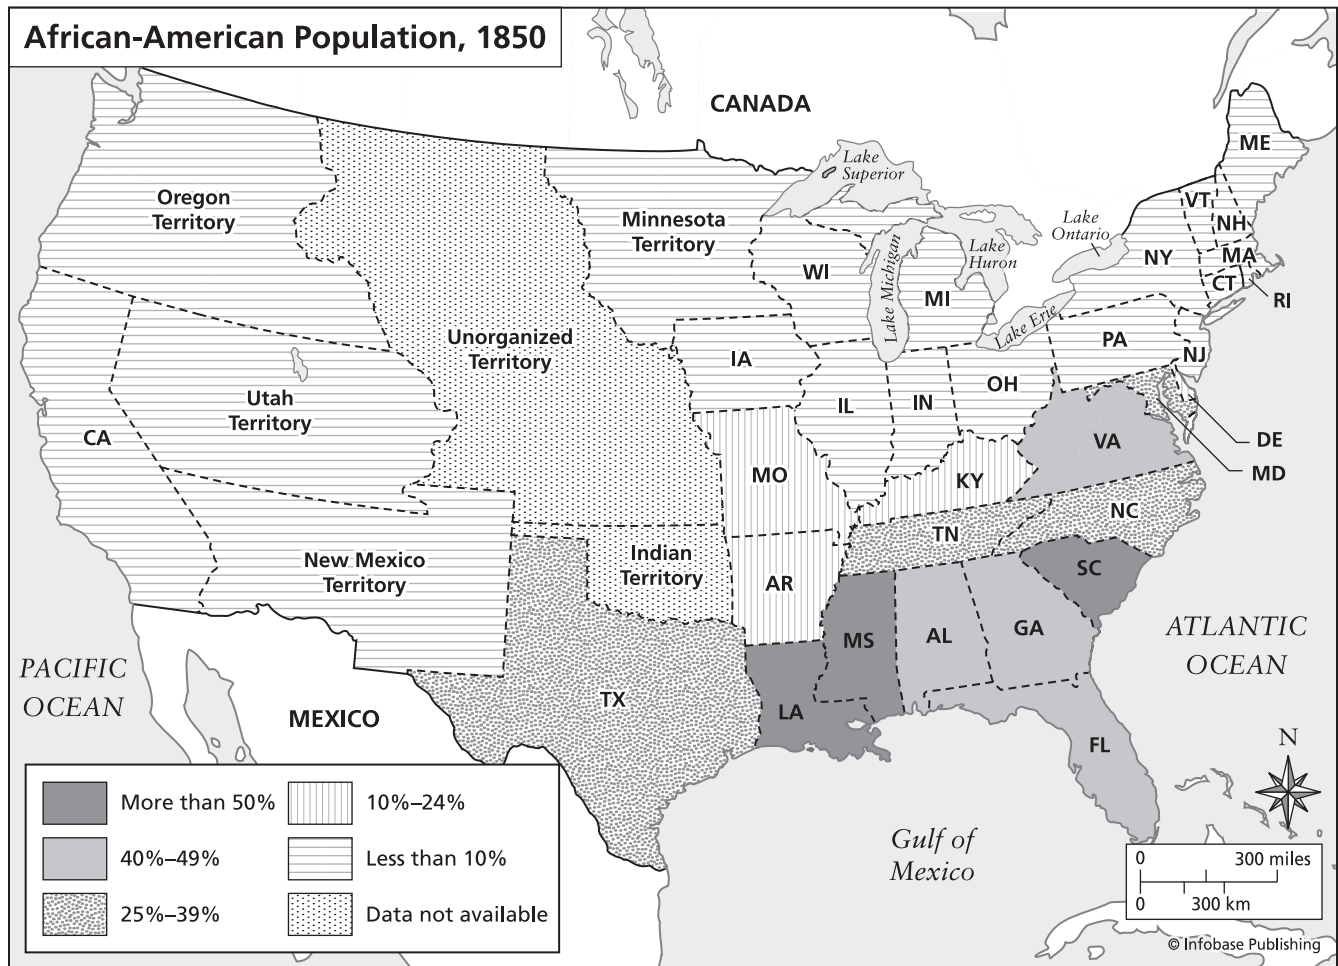

Despite the best attempts of slaveholders to restrict their pastimes, some enslaved men and women did receive a rudimentary education from literate members of their community or sympathetic free whites and blacks. While large gatherings of slaves were often prohibited, owners could do little to prevent women from performing chores such as laundry and cooking together, and such labor gave participants the chance to spend time together away from the eyes of overseers or employers. Religious meetings also took place, with slaves creating their own interpretation of the Bible and often drawing on their African heritage to create their own expressions of spirituality.

In reality, church was one of very few spheres available to blacks where white interference remained at a minimum. Given their plight as slaves, many African Americans

welcomed the arrival of evangelical Protestantism earlier in the century, whose lively sermons, open emotionalism, and spiritual egalitarianism were a dramatic departure from the staid, formal instruction of traditional Protestantism. The sheer emotion inherent in evangelical Christianity also mimicked that of traditional African worship, with all its weeping, singing, and trancelike stages. Furthermore, camp meetings and revivals were open to white and black alike, regardless of class or status, and blacks were also free to preach as licensed ministers. This spurred the development of several exclusively black churches in the North and South, and both fulfilled a similar service in granting attendants some spiritual and psychological relief from their mutual predicament.

Black churches also became the locus of community efforts in the North and a center for educating members and collectively addressing social issues. Moreover, after the 1830s, black ministers began using the pulpit to assail the institution of slavery as a moral evil that no Christian, white or black, could readily condone. Noted black ministers such as Samuel Cornish used their position and affluence to publish abolitionist newspapers such as *Freedom's Journal*, while others such as HENRY HIGHLAND GARNET beseeched whites to consider the negative impact that racism exerted on both communities. For many blacks, both free and slave alike, religion was an escape from reality and an outlet for advocacy, providing them with moral uplift, a promise of redemption, and ultimate deliverance from the manifest evils besetting them.

Yet not all African Americans were enslaved, and the free black population of the United States grew throughout the 19th century. Prejudice, however, tempered what it meant to be free. Local and state laws often prohibited free African Americans from unrestricted freedom of movement, owning property, or voting. In the North, racial prejudice against African Americans resulted in segregated neighborhoods and the threat of violence. Competing with new immigrants for employment, few northern African-American men and women were able to significantly change their economic status over time. Blacks were usually denied entrance into the professions to preclude any possible competition from them, and for the most part they were forced to accept menial positions at scant pay. Thus disposed, they were condemned by poverty to live within segregated ghettos, attend inferior segregated schools, and be interred in segregated cemeteries. Mounting anti-abolitionist mob violence only exacerbated their plight. The aid of sympathetic and wealthy whites, however, did provide some legal recourse to improve their lot. In the South, free African Americans faced less competition for the jobs they held, but white fears of cooperation between slaves and free blacks leading to rebellion meant that their lives outside the workplace were greatly circumscribed.

The political and social activism of free African Americans was nevertheless wide-ranging. Through churches, fraternal orders, and voluntary organizations, free African Americans often provided social services to their communities, aiding one another in times of economic or medical hardship. Such organizations were also key to the expansion of literacy within the African-American community.

Free African Americans were a central force of the 19th-century ABOLITION MOVEMENT. While individuals and religious groups such as the Quakers had opposed the operation of slavery in the United States, it was not until the 1830s that a formal abolition movement coalesced. In 1832, the New England Anti-Slavery Society was founded by William Lloyd Garrison, a white liberal, in Boston. In that same year, the first Female Anti-Slavery Society was established in Salem, Massachusetts, convened by a group of free African-American women. Since women of all colors were originally excluded from Garrison's society, the Boston Female Anti-Slavery society was also founded in 1832. The society welcomed white and black members, as did the Philadel-

phia Female Anti-Slavery Society, founded by LUCRETIA MOTT in 1833. Throughout the antebellum period, whites and free African Americans, along with a growing number of fugitive slaves, worked to attain the abolition of slavery through speaking tours and the publication and dissemination of antislavery literature. Some of the most significant publications to spring from the movement were the autobiographies of escaped slaves, including *Narrative of the Life of Frederick Douglass, A Slave*, published in 1845.

The success of the Underground Railroad also depended on the activism of many free African Americans and escaped slaves. The Underground Railroad was neither underground nor a real railroad. Instead, it was a loose coalition of free men and women of all racial backgrounds, as well as a number of escaped slaves, who aided enslaved men and women in their quest to escape to the North. Many black abolitionists, including Frederick Douglass and Sojourner Truth helped shelter or guide fugitive slaves on their journeys. Perhaps the most famous participant in the work of the Underground Railroad, however, was Harriet

Tubman. Born into slavery in 1821, Harriet was married to John Tubman, a free black, in 1848. Her marriage did not secure her freedom, however, and her husband opposed any talk of escape. Rather than be sent to Georgia after the death of her original master and the failure of an escape attempt (her husband's opinion notwithstanding), Harriet escaped again and made it to Philadelphia. She then went back into the slaveholding territories to assist her sister and her children to escape, and continued to travel into the South to do the same for others. It is estimated that she aided over 300 enslaved men and women in her lifetime, acting as their guide and directing them to homes where they would be sheltered before the next leg of their journey. Numerous other African Americans made similar journeys or offered their homes as "stations" along the railroad.

While the contentious issue of whether they were considered the property of another human divided free and enslaved African Americans in the 19th century, many other considerations joined the communities together. All African Americans battled against racial prejudice and its effect on their legal and economic status. All experienced, to a greater or lesser degree, the presumption that whiteness was an inherent part of citizenship in the United States. Despite the definitions and expectations of mainstream America, African-American men and women refused to ever acquiesce completely to the demands of those outside their communities. Whether free or enslaved, African Americans faced the challenges of legal, social, and political prejudice with creativity and established patterns of association and activism that would support them far into the post-Civil War period.

## agriculture

In the first half of the 19th century, agriculture defined the U.S. way of life economically and socially. It was the primary means of sustaining the ECONOMY, through the production of raw products such as cotton, which between 1815 and 1845 generated between one-third and more than one-half of the value of all U.S. exports. On the more than 2 million farms that existed by 1860, most farmers were able to juggle a mix of commercial and subsistence farming and to see profit. What accounted for these advancements in agriculture during the antebellum years? In large part, it depended on geographic expansion and technological innovation. Both changed the face of U.S. agriculture before the Civil War. And both contributed to the striking dichotomy of American agricultural systems throughout the antebellum period, namely the proliferation of small-scale farmers in the North and large-scale plantations in the South.

Throughout the 19th century, various regions developed crops that reflected their particular geographic riches. Tobacco was grown across Virginia and the entire Upper South. Rice was harvested along the tidal rivers of Georgia and South Carolina. Hemp was produced in Kentucky, sugar in Louisiana. Across the South and West, cotton was grown. In the North, Ohio was known for pork, Ohio and Illinois for cattle. New York and Ohio were centers for cheese.

Also during this period, migration patterns, which moved largely westward, reflected the search for new fertile land. The rapid settlement of rich agricultural lands west of the Appalachians led to the founding of several states during the antebellum period: Indiana (admitted to the Union in 1816), Mississippi (1817), Illinois (1818), Alabama (1819), Michigan (1837), Texas (annexed in 1845), and Iowa (1846). Curiously, this trend coincided with the westward drift of the wheat belt. A significant northern staple, wheat was experiencing difficult times in New York, Pennsylvania, and New England owing to weather and parasite-related factors, but it rapidly adapted to the prairies with considerable success. By the Civil War era Illinois, Indiana, Wisconsin, Iowa, and Minnesota were the chief wheat-producing states.

The first major changes in farming came about through new technologies. As the 19th century began, a farmer's main agricultural tools were the axe and plow. Led by the cotton gin in 1793, a number of labor-saving devices were invented, reducing the hours of labor involved in nearly all aspects of farming. Among the labor-saving items that came into common use during the first half of the 19th century were the thresher, reaper, iron and steel plows, grain drills, corn and cotton planters, seed drills, and iron harrows and cultivators. Distinguishing many of these implements was the fact that they were designed to employ animal rather than human power, which reduced the farmer's workload.

The trend toward animal power boosted the ease and efficiency of nascent farming technology and increased demand for high-quality draft animals like the Clydesdale. It is estimated that by the turn of the century, no less than 25 million horses labored in agricultural capacities, a period that also witnessed the percentage of Americans engaged in farming decline to less than 38 percent.

For settlers and farmers, clearing land was a central task, and most northern and southern farmers in the early 19th century did so with a Carey plow. Using its wooden moldboard and wrought-iron share, farmers plowed up to one acre per day. For much of the antebellum period, prairie farmers employed the breaking plow or prairie breaker, which could crack fibrous soil. A major drawback was that it required multiple oxen and men. Much more efficient were steel plows, which were devised by various inventors beginning in the 1830s and refined by blacksmith JOHN DEERE. As refining processes reduced the price of steel during the 1840s and 1850s, the steel moldboard plow, known as the “singing plow,” became popular on the prairie. Demand for the device proved nearly insatiable, and by 1858 the John Deere Company was manufacturing an average of 13,000 steel plows per year. By 1835, iron and steel plows also entered common use in the North; but in parts of the South, a one-horse wood-and-wrought-iron shovel plow was used. The cast-iron Eagle plow, with a long, curved moldboard, was popular in the North and South.

Other mechanical advances included the hand corn planter and the horse-drawn corn planter, which was developed in the 1850s. These planters greatly increased the amount of seed a farmer could plant with a hoe. Developed in the 1820s, the horse-hoe used horse-drawn power to cultivate crops more efficiently. For harvesting crops, farmers finally found a labor-saving alternative to the scythe when the horse-drawn reaper was developed. Created in 1831 and patented in 1834 by CYRUS HALL McCORMICK, it cut down 10–12 acres of wheat per day. By 1860, the reaper was used in 70 percent of U.S. farms. By 1857 rising wheat prices allowed farmers greater purchasing power to buy expensive McCormick reapers, and the factory was hard-pressed to maintain a yearly output of 1,000 machines. Thirty years later sales continued to rise in the vast wheat-growing regions to 250,000 units every year. Shortly before the end of the antebellum period, in 1854, an automatic raking mechanism was developed to gather cut grain for harvest. It later gained common use.

The thresher, which separated the grain from the stalks, was developed in the 1820s. It was refined in 1837 with a device that separated the chaff from the straw. By the 1850s they were in common use. The grain combine, which joins the reaper, thresher, and winnower, was developed in 1835, but its weight and multiple-horse requirement made

it unappealing to small to medium-sized farmers. This implement was refined later in the century. Other advances of the period include the steam planter and steam-powered cotton gin.

The movement toward agricultural mechanization also involved the building of factories for food production. Beginning in the 1820s meatpacking facilities handled pork and cattle at Cincinnati, Chicago, and other sites. By the 1850s factories in the North and West produced cheese in standardized form. This form of industrialization rid homes of the chore of producing cheese for commercial use while also providing farmers a ready outlet for excess dairy products.

In the South the lifetime labor of slaves was central to the region’s agricultural expansion and success. Here, the essential technology most closely identified with the region was Eli Whitney’s cotton gin, which first appeared in 1794 and helped indelibly cement the South to the cotton culture. Deceptively simple in appearance, it consisted of a rotary cylinder attached to a fixed comb for removing the seed from raw cotton. Yet when hand cranked, it efficiently rendered slavery profitable and—in effect—crowned “King Cotton.” Cotton exports became the major American cash crop by 1860, accounting for nearly 60 percent of all total exports by value. Output that year also crested at 4.5 million bales, which also constituted three-fourths of the world’s total cotton production. None of this could have been possible without the coerced labor provided by AFRICAN AMERICANS. Male slaves, controlled by the white overseer and African-American driver, were expected to pick about 200 pounds of cotton per day, plow fields, and plant, among other tasks. Female slaves picked about 150 pounds of cotton per day and wove linen and wool, in addition to other domestic jobs. The increased production of bonded workers encouraged plantation farming and especially enriched owners. Given the South’s large population of 11 million people and the region’s dependence on a single, slave-driven crop, there was also a large market for corn and beef from northern states.

In all regions, farm women planted and harvested crops in addition to supervising the household, cooking, and caring for the gardens and household livestock. Women of slave-owning families also supervised slaves’ domestic activities. As one farm woman wrote, it was “boiling and baking, turning the spinning wheel and rocking the cradle.” They also engaged in a variety of home manufactures for trade. In the North, dairy products were popular home manufactures, and until factory-made clothing became available, women spun flax and wool as well as made linen cloth for trade. The rise of manufactured goods increased the ability of a woman to leave the farm but decreased her ability to contribute directly through farm manufactures to the family economy.

## 12 agriculture

In general, life for the farm family was one of work, isolation, and limited social contact. The church provided social connections, with its rhythms of baptisms, marriages, and funerals. Similarly, communal labor-related activities such as barn-raising and threshings contributed to the frontier society. To fuel increasing demand and in response to the changing soil, farmers developed new varieties of crops and refined animal breeds for specific agricultural uses. In Virginia during the 1850s, farmers created a new variety of tobacco called bright yellow, which, when specially cured, was used to wrap chewing tobacco. In the North, farmers bred and fed their cattle to produce dairy products with revenue-producing higher butterfat content. Western farmers also pioneered the importation of cattle such as the Shorthorn variety to improve livestock quality. Dairy farmers imported the Jersey cow in 1817, the Guernsey in 1830. Farmers also adjusted their crops to fill specialized markets. For example, when western farmers cornered their market by delivering low-cost grain, corn, and livestock, eastern farmers responded by adapting their crops and focusing on perishables such as dairy products and produce for ongoing delivery to cities.

Driven by increased demand for and production of foodstuffs, antebellum inventors developed various improvements to transport crops. Refined in 1807 by Robert Fulton, the steamboat, which could navigate a river or ocean, came into use from the 1810s to transport foodstuffs from west to east and along coastlines. By 1850, just under 750 steamboats were transporting raw materials and food along the Delaware, Hudson, and Mississippi Rivers, and along the coastlines. To link various strategic bodies of water, more than 1,000 miles of canals were dug following the success of the ERIE CANAL. Built between 1817 and 1825, the Erie Canal connected the agriculture-rich Ohio Valley at Lake Erie to the Hudson River and the commercial hub of New York City. By 1835 the price for shipping goods along the canal dramatically declined from a high of \$22 per ton to only \$4, which facilitated the shipment of market crops to New York by small farmers. That metropolis soon emerged as the nation's largest market for agricultural goods. Once the new railroad technology linked New York City to other burgeoning urban centers along the eastern seaboard, this network ensured a steady market for small-scale northern farmers engaged in traditional farming and production of high-value commodities such as milk, butter, cheese, and fruits.

Finally, while steam-powered water and wheel-based land transportation dominated much of early 19th-century transport, RAILROADS came into use for agricultural transport by the 1840s and within decades became the dominant form of transportation for humans and foodstuffs alike. Some 30,000 miles of track were in use by 1860.

Financed in part through state and federal funds, transportation routes also increased and became more efficient during this period. The barriers to transatlantic trade during the WAR OF 1812 gave rise to trade along the Atlantic coast, with important northern ports in Boston and New York and southern ports in Mobile and New Orleans. Inland transport of foodstuffs, particularly from the western states of Ohio and Pennsylvania, was improved by the NATIONAL ROAD, which linked the Ohio Valley and the mid-Atlantic states, and the many side roads constructed during the period. In addition to streamlining food transport, these improvements spurred productivity and shifted areas of agricultural specialization. For example, the West became a major supplier of food and grain to the Northeast once farmers in the Ohio Valley region could ship wheat and corn along the Erie Canal and Ohio and Mississippi Rivers.

Conservation practices among most U.S. farmers of the age centered on labor conservation through the widespread use of implements such as the cotton gin (1793). Time conservation was also practiced through transportation advances such as the steamboat. But as of the mid-19th century, there was relatively little soil conservation. Given the amount of fertile land in the United States and the crudeness of fertilizers, farmers who had exhausted their land migrated to new soil. This practice was evident in the migration south and west to plant cotton once the soil in the Upper South had been exhausted in the early 1800s. One observer of the time said of the South, "The new country seemed to be a reservoir . . . and every road leading to it a vagrant stream of enterprise and adventure."

Despite these anticonservation tendencies, some farmers and agricultural reformers formulated soil and other conservation practices. The U.S. government helped the cause, to an extent. Beginning in 1839, the U.S. Patent Office offered reports on farming advances and technology, including a lengthy annual report distributed to farmers free of charge. The work of the Patent Office, along with the advocacy of the U.S. Agricultural Society, laid the groundwork for the development of the U.S. Department of Agriculture.

Of all farmers, northeasters were generally the most well-versed in the common preservation practices of crop rotation and letting land lie fallow. These practices were not applicable for farmers of a single crop in great demand, such as cotton. However, one group of farmers along the coasts of Georgia and South Carolina did practice a form of crop rotation, turning to rice after the soil had been depleted by cotton or when rice might yield a higher return than cotton, as it did in the 1830s. Still, given generally declining prices for rice over the antebellum years, only large-volume, slave-labor plantations could still make money from the crop. In any event, cotton eclipsed rice, moving rice cultivation westward after the Civil War.

As the antebellum years came to a close in 1860, agricultural products remained central to the U.S. economy, accounting for 82 percent of U.S. exports. Producing 838 million bushels of corn, 172 million bushels of wheat, and over 2 billion pounds of cotton, the United States was its own primary supplier to domestic food processors and manufacturers. These products from across the nation's 2 million farms included food-related crops such as corn, wheat, other grains, fruits, and vegetables as well as livestock; and raw materials such as cotton and tobacco. Together, they revealed the wealth of the U.S. agricultural landscape and the efficiency of new cultivation methods and technological refinements. By the last quarter of the 19th century, these advances, coupled with the large number of working U.S. farmers, would provide the means by which the United States (along with the rest of North America and Australia) would overtake Europe as the world's leading producer of food.

Apart from the measurable advantages of improving farming practices and increasing productivity, the country's success with commercial agriculture brought lasting changes to the ways U.S. citizens lived. Farmers who once produced all the items they needed for daily life now purchased manufactured goods. This practice pointed to another overall shift, toward regional interdependence. As one region like the Ohio Valley specialized in grain, it depended on another specialized region, such as the Northeast, for textiles. Although for the most part the South produced its own foodstuffs, it depended on the North for many manufactured goods, for storing some of its cotton before export, and for providing credit to establish planting sites. In all, these practices promoted a national sense of self-sufficiency.

As the century moved on, agriculture continued to dominate the economy, but challenges to its position were in process. Increasingly, people were moving to urban areas and engaging in nonagricultural vocations. In 1860 more than 75 percent of southerners made their living through agriculture, but this percentage would erode greatly during the next several decades.

Still, whether small-time farmer or plantation owner, farmers of the 19th century believed in the importance of owning land. To this end, the U.S. government offered several bills which, to varying extents, served settlers' needs. After the PANIC OF 1819, many farmers were unable to pay for the lands they had purchased from the government on credit. In response, the government ended its credit practices and opened land at \$1.25 per acre, to be paid by farmers in full. Still unable to pay for the land, the squatters who had settled their land were granted another chance through the Preemption Act of 1830. This law allowed them to buy surveyed land from the federal government and granted a year to pay costs. Given that this provision was used in large

part by speculators, the law was superseded by the Preemption Act of 1841, which required claimants on surveyed land to live on and settle the public-owned land. Unclaimed or western lands came to be subject to the Graduation Act of 1854, which reduced the price of land not sold over the course of 10–30 years.

Politically, this developed into a battle between established southern landowners who wished to retain power, the westerners who wished to settle large quantities of land, and a government undecided on whether selling land or providing it for quick settlement would best serve the economy. These questions would be debated on a national level for years to come.

The issue of free public land was not resolved until after the South had seceded and Congress passed the Homestead Act of 1862, which allowed heads of households to claim 160 acres of frontier land at no cost in exchange for five years of residency and cultivation. Such legislation underscored the government's commitment to the preservation of small family farms as the bulwark of the national economy.

## The Alamo

The Alamo, a mission fortress located in San Antonio, TEXAS, is the site of one of the most famous battles in American history, although it was located outside of the United States at the time of the siege that made it famous in 1836. The original building was a Spanish mission that Franciscan priests established in 1718. The Spanish government converted it into a fort and army barracks in the late 18th century.

In the early 19th century the Spanish, seeking to revitalize parts of their American empire, encouraged white

## 14 The Alamo

citizens of the United States to settle the desolate province of Texas. Not many did at first. In the meantime the new republic of Mexico gained its independence from Spain in 1821, and its government urged its own citizens to settle in Texas. In part as a reaction to the economic distress caused by the PANIC OF 1819, land-hungry Americans from the South were pushing toward the lands beyond the boundaries of the United States in the 1820s. “Gone to Texas” was the cry of emigrants from Kentucky, Tennessee, and other states. Initially, the new Mexican government considered this immigration to be illegal, but, realizing they could not stop it, they finally welcomed the Americans to Texas, as long as the immigrants agreed to live by the laws of Mexico. Texas then became a state in the new republic of Mexico.

American *empresarios*, adventurers who were given land in return for bringing in new settlers and families to Texas and converting to Catholicism, tended to be aggressive, ignoring Mexican laws and customs, and thought of themselves as Americans, not Mexicans. They also remained Protestant. Some of the settlers brought their slaves into the rich cotton fields of east Texas, even after Mexico had outlawed slavery. Alarmed by these developments, Mexico passed a law in 1830 banning further immigration into Texas, but it was widely ignored. By 1835 Texas was home to 27,000 Americans, some of whom were small slaveholders; 3,000 of their slaves; and only 4,000 Mexicans, most of whom lived in the towns of Goliad and San Antonio.

The government of the United States tried to buy Texas from Mexico in the middle of the 1830s but was rebuffed. This interest in Texas was encouraged by the idea of MANIFEST DESTINY, which held that the United States was destined by God and nature to rule all of North America; there was even some talk that the nation would eventually encompass all of the Western Hemisphere. Concerned that it might eventually lose Texas to the United States, Mexico tried to exert its authority over the region and enforce the ban on slavery. In response, the Texans split into two camps. A “peace party” under STEPHEN AUSTIN’s leadership favored working with the Mexican government for more local autonomy and recognized the ultimate sovereignty of the national government in Mexico City. But another group of Texans, the “war party,” wanted no negotiations and immediate independence from Mexico. Austin did get some concessions from the Mexican government, but then General ANTONIO LÓPEZ DE SANTA ANNA became president and then dictator. Uninterested in negotiating with the Anglo-Texans, he appointed a military commander for Texas who answered directly to Mexico City, and he ordered Mexican troops into Texas as a show of strength. The American settlers rebelled and forced out the small contingent of Mexican soldiers. Santa Anna, angered by this defiance, personally led a large army into Texas to

subdue the rebellion, reaching San Antonio in February 1836. Texans in the meantime had declared their independence from Mexico and adopted a constitution.

Santa Anna’s army of 5,000 advanced on the Alamo in San Antonio, which was defended by about 180 men. Most prominent among them was DAVY CROCKETT, the legendary frontiersman and former Whig congressman from Tennessee; and JIM BOWIE, the well-known adventurer and popularizer of the “Bowie Knife.” The small garrison’s commander was WILLIAM B. TRAVIS, another southerner and a slave owner. Travis was only 26 and was originally supposed to share the command with Bowie, but the latter fell seriously ill and had to be confined to bed. Although most of the garrison were Anglo-Americans, half from Kentucky, Tennessee and Alabama, their number also included native Mexicans who opposed Santa Anna and his dictatorship.

Santa Anna ordered the immediate surrender of the Alamo by its defenders. One of the many legends that have shaped popular understanding of the siege at the Alamo holds that Travis gave permission to his men to leave if they wished, but supposedly only one took the chance to leave the fort. Travis also sent appeals throughout Texas asking for volunteers to defend the Alamo. Only a few dozen men found their way to the besieged fort. Having refused to surrender, the defenders of the Alamo faced hopeless odds as Santa Anna’s huge army prepared to attack. In the early morning of March 6, 1836, the Mexicans launched their assault on the Alamo, and suffered heavy initial losses. Eventually some of the attackers were able to scale the walls of the fort, however, and they engaged in ferocious hand-to-hand combat with the Texans in the courtyard and interior of the Alamo. By the time the fighting had ended, all of the Alamo’s defenders had been killed, along with about 1,500 soldiers in Santa Anna’s army. Travis’s slave, Joe, was among the handful of noncombatants who survived the slaughter.

The Mexicans quickly moved on to the settlement of Goliad, hoping to deliver the Texas rebellion a second crushing blow. There a small and overwhelmed army of 371 Texans surrendered with the expectation that they would be treated as prisoners of war. Instead, Santa Anna declared them pirates and ordered them executed, after which he believed the rebellion to be over, with more than 500 Texas insurgents now dead. However, the fallen defenders of the Alamo became instant heroes and legends in the United States, immortalized in penny newspapers from New Orleans to New York. Santa Anna and his men were portrayed as henchman of the pope and a threat to American liberty. There were demonstrations in U.S. cities against Mexico, and Santa Anna was burned in effigy. Buoyed by the spirit of revenge, adventurers and soldiers from all over the United States rushed to Texas and joined an army led by SAM HOUSTON. At this point,

Santa Anna made the mistake of dividing his army, which allowed Houston and his Texans to defeat his forces decisively at San Jacinto in April of 1836. Texas had won its independence, and the cry of “Remember the Alamo” had entered American lore.

### American Anti-Slavery Society

Founded in Philadelphia on December 4, 1833, the American Anti-Slavery Society (AASS) advocated the immediate and complete abolition of slavery throughout the United States and its territories.

Although abolitionism became a nationwide movement in the 1830s, its roots go back to the American colonies. Prior to the Revolutionary War, Quakers and other religious groups opposed slavery as anti-Christian. Free blacks, many of whom had escaped slavery, spoke out vociferously against the “peculiar institution” and helped publicize many of its horrors.

At the founding convention of the AASS, three key figures shaped the fledgling organization: William Lloyd Garrison and two brothers, ARTHUR and LEWIS TAPPAN. Arthur Tappan became the group’s first president. Impetus for forming the AASS had come from the first Black National Convention, which had taken place in Philadelphia two years earlier. Organizers had invited several white men to the meeting, where delegates determined that an immediatist, biracial organization was needed. According to a contemporary account by John G. Whittier describing the 1833 meeting, most of the 60 attendees were white, with only “two or three colored members.” Those black men—Robert Purvis, James G. Barbadoes, and James C. McCrumbell—were all prominent abolitionists. Also attending the 1833 convention were four white women, all Quakers.

Garrison drafted the new society’s constitution, which pledged its members to work for emancipation through nonviolent means, such as “moral suasion,” and “the overthrow of prejudice by the power of love.” Membership in the organization grew rapidly; by 1835 there were more than 400 chapters, and by 1838 the number had grown to 1,350, with more than 250,000 members. Many of the offshoot groups included African Americans and women,

although black and women’s auxiliaries were also common. The local chapters of the AASS sponsored meetings, adopted resolutions, signed antislavery petitions to be sent to Congress, published journals, and sponsored lecturers to carry the antislavery message to northern audiences.

Antislavery petitions were sent to Congress at such a high rate that a number of southern members of the House, with the support of a significant portion of northern representatives, succeeded in passing the Gag Rule in 1836. This regulation prevented any petition regarding slavery from being read aloud; instead, antislavery petitions would be tabled indefinitely. By 1844 the Gag Rule, which had come under fire from JOHN QUINCY ADAMS, was repealed.

Garrison, one of the best-known abolitionists of the mid-19th century, is considered by many historians to have been more of a lightning rod than a true leader. Although he served as president of the AASS from 1843 through 1865, his was largely a symbolic role, as he was not known as an effective organizer. His outspoken editorials in *The Liberator*, a newspaper he published between 1831 and 1865, called for an immediate end to slavery without reparations to slaveholders. Most of the general public of the North considered this an extreme position; even those who felt morally opposed to slavery preferred a more gradual phasing out of a complex political economic system that was protected by the Constitution. But Garrison, who drew a clear moral distinction regarding the ownership of human beings, was not one to consider compromise an option. Advocating secession from the Union by northern states on the grounds that the Constitution permitted slavery, he even burned a copy of the Constitution in protest on July 4, 1854.

During a meeting of the Boston Female Anti-Slavery Society in 1835, Garrison was attacked by a mob of seemingly peaceful attendees. This event gained him considerable sympathy and inspired WENDELL PHILLIPS, a Boston lawyer, to devote himself full-time to the cause of eradicating slavery. Phillips contributed frequently to *The Liberator*. He became known for his impassioned and eloquent speeches against slavery, most notably his 1837 address delivered after the assassination of fellow abolitionist ELIJAH LOVEJOY. Along with Garrison, Phillips supported women’s rights.

THEODORE DWIGHT WELD, a minister and skillful political organizer, is considered by many historians to have been more influential than Garrison. In 1834, while a teacher at Lane Theological Seminary in Cincinnati, Weld organized a series of infamous student debates. These debates spurred a rash of student abolitionist organizing, which led to Weld’s dismissal from the faculty. Weld married ANGELINA GRIMKÉ, a fellow abolitionist and women’s rights activist, in 1838. A skilled writer, he edited AASS’s paper *The Emancipator* from 1836 to 1840. Weld published many writings pseudonymously, including the highly influential *American Slavery as It Is* in 1839, which

## 16 American Colonization Society

served in part as a basis for Harriet Beecher Stowe's *Uncle Tom's Cabin*.

The AASS published a number of books and periodicals, including *The Emancipator*, *Human Rights*, *Slave's Friend*, *Quarterly Anti-Slavery Magazine*, and the *Anti-Slavery Record*, with highly regarded writers of the period contributing their talents. The *Slave's Friend* was aimed at children and included poems, songs, and drawings. In addition to supporting the formation of juvenile antislavery societies, the *Slave's Friend* also encouraged children to collect money for the cause.

In addition to its prolific publications, the AASS sponsored lectures by its own members as well as former slaves like Frederick Douglass, publisher of *The North Star*,

an abolitionist newspaper; and William Wells Brown, a novelist.

The AASS provided fertile ground for debates over many of the period's most controversial issues. The organization opposed the movement to send free blacks to Africa under the auspices of AMERICAN COLONIZATION SOCIETY, arguing that removing free blacks was a means of strengthening slavery. Garrison railed against colonization time and time again in *The Emancipator*; many issues of which were devoted exclusively to anticolonization arguments.

Perhaps the most divisive issue faced by the AASS was that of the place of women in the antislavery movement as well as in society at large. By the mid-1830s more than 100 female antislavery societies had been created, and female abolitionists were circulating petitions, editing abolitionist tracts, and organizing antislavery conventions. This issue reached the boiling point in 1840 at the annual meeting of the AASS in New York, leading the Tappan brothers, who opposed the full inclusion of women out of fear of alienating the churches, to form a new organization, the American and Foreign Anti-Slavery Society.

The American Anti-Slavery Society elected ABIGAIL KELLEY FOSTER to its business committee and named three women delegates (Foster, LUCRETIA MOTT, and Elizabeth Cady Stanton) as delegates to the World Anti-Slavery Convention in London. These women were then relegated to seats in a balcony on the grounds that their participation would offend British public opinion. The exclusion of women from the floor led Garrison and three other male abolitionists to boycott the convention and sit with the women in the balcony.

The American Anti-Slavery Society disbanded in 1870, after the Fifteenth Amendment to the U.S. Constitution granted black men the right to vote.

### American Colonization Society

The American Colonization Society (ACS) was formed in 1816 to send free African Americans to African shores. Created by a coalition of white philanthropists who wanted to provide incentives for ending SLAVERY and slaveholders who wanted to deport free blacks (whom they deemed to be subversive to plantation discipline), the colonization society grew steadily during the 1820s and 1830s. In fact, it became one of the largest reform organizations of the

early antebellum era, with more local chapters than even abolitionists had in such northern states as Pennsylvania. In addition, the colonization society attracted the support of some of the nation's leading political figures, such as ex-president James Madison, presidential hopeful Henry Clay of Kentucky and Massachusetts governor and renowned orator Edward Everett. The colonization society sponsored the expatriate colony of Liberia and generated intense debate among black as well as white reformers over the society's goals and motivations. The group existed through the Civil War before formally ending operations in 1865.

The American Colonization Society operated through national and branch organizations. It held an annual convention and published its proceedings every year. In addition, it printed a newspaper promulgating the society's activities, *The African Repository*. Perhaps the group's most famous single undertaking was the establishment of Liberia, a colony of former slaves located on the western coast of Africa. Founded in 1823, Liberia achieved independence in 1847, becoming a destination for a number of free black activists, including former anticolonizationist John Russwurm, a coeditor of the first black newspaper, *Freedom's Journal*, published in New York City between 1827 and 1829; Martin Delany; and Thomas Morris Chester. The American Colonization Society garnered donations totaling nearly \$2.5 million for the colony of Liberia. Roughly 12,000 free blacks and former slaves eventually traveled there. The ACS initially headed most of the colony's main posts: White appointees from the American Colonization Society controlled Liberia until 1841, although black settlers held a variety of powerful administrative positions, including secretary to the colonial agent, acting governor, and superintendent of education.

Beyond Liberia, the American Colonization Society spurred two important and interrelated events after its founding in 1816. The first involved colonization's impact on black activism; the second, colonization's impact on the broader cause of abolition. Although some African-American leaders, such as James Forten of Philadelphia, listened to early colonizationist plans with an open mind, most black Americans vehemently opposed the group. Arguing that the American nation was a black homeland too, and that Americans must end slavery immediately rather than export black activists, they organized against colonization in cities and towns ranging from Boston to Baltimore. The largest black anticolonization demonstration occurred in Philadelphia at Richard Allen's African Methodist Episcopal Church. Several hundred protesters forced the city's black leaders to publicly condemn colonization. Black leaders in other communities did likewise between 1817 and the early 1830s.

This groundswell of black activism was the only public movement against colonization before the 1830s, when a

new generation of radical abolitionists emerged in American culture. The nation's leading antislavery societies during the early 1800s disavowed colonization as a strategy for ending slavery but also refrained from publicly attacking the American Colonization Society or its leaders. Early abolitionists, led by the Pennsylvania Abolition Society and the New York Manumission Society, sought to curry favor with the nation's leading politicians, jurists, and philanthropists. In this manner, early reformers hoped to slowly but surely build political support for gradual abolition plans. Early abolitionist groups did not accept black members, either, although they did work with local black leaders in community schools and in courts of law.

African Americans hoped to prevail upon early white abolitionists to support their anticolonizationist struggle. They petitioned white reformers and met with them privately on several occasions. For over a decade, however, the Pennsylvania Abolition Society and American Convention of Abolition Societies refused to unleash public condemnations of colonization. African-American reformers filled this void. During the 1820s Boston's David Walker issued perhaps the most famous black pamphlet of the antebellum era, "An Appeal to the Colored Citizens of the World." Walker called on African Americans to organize anew against slavery and racial injustice. In particular he focused on the evil of colonization, arguing that the plan merely sought to rid the country of free blacks as a means of strengthening slavery. According to Walker, African Americans had to raise national voices of protest in response.

In this way, colonization became a springboard for a new and more radical brand of abolitionism. William Lloyd Garrison, the famed editor of *The Liberator*, was influenced by black anticolonization protest during the late 1820s. After meeting such black activists as James Forten and Baltimore's William Watkins, both of whom provided Garrison with black protest documents, the young white printer shifted his beliefs. No longer a quasicolonizationist or gradual abolitionist, he vowed to become the most ardent opponent of slavery and colonization in the country. Garrison began publishing his own newspaper in Boston in 1831, and he consistently debated colonization speakers throughout the mid-Atlantic and New England. In 1832 Garrison also published a pamphlet opposing colonization, "Thoughts on African colonization," which prominently featured black protest documents.

## American Fur Company

A fur-trading company started in New York by JOHN JACOB ASTOR in 1808, the American Fur Company eventually came to monopolize the American fur trade. Originally the only stockholder, Astor began the company in an effort to compete with two Canadian fur companies that were encroaching into American territory to do business, mainly in beaver hides. To challenge the North West Company and the Michilimackinac Company, Astor first tried to gain trading rights to the Great Lakes region. In 1811 he made an agreement with the two Canadian companies to form a partnership called the Southwest Fur Company, which would restrict its business to south of the Canadian border.

Also in 1811, his employees established ASTORIA, a trading post in Oregon located where the COLUMBIA RIVER meets the Pacific Ocean. These efforts to control the Pacific Northwest through another subsidiary, the Pacific Fur Company, were thwarted when Astoria was captured by rival trading companies and then fell into British hands during the WAR OF 1812. When Astoria was restored to the United States by the TREATY OF GHENT in 1814, the Astor interests had already been sold to the North West Company. But while some of the company's trading activities were temporarily sidelined during the war, Astor's enterprises recovered soon after and continued to grow. By 1817, he had bought out the two Canadian companies and established his own northern department of the American Fur Company as the main trading company in the Great Lakes area, centered at the Mackinac trading post. From this time on, he was no longer the only stockholder but added partners as he bought out or negotiated with competitors.

After securing his stake in the North, Astor began establishing his presence in the rapidly developing western fur trade, which was then centered in St. Louis. Upon negotiating terms with existing St. Louis companies such as the St. Louis MISSOURI FUR COMPANY (see also CHOUTEAU FAMILY), Astor was able to open a western department of his firm by 1822, concentrating on the Missouri River fur trade. Still intent on monopolizing the American fur trade as much as possible, Astor continued to plan ways to undermine his competitors. He still faced formidable competition from Kenneth McKenzie's Columbia Fur Company and from federally supported Indian factories. Started in 1795, the Indian factory system was intended to protect Indians from exploitation by private traders and promote peaceful relations between the United States and Indian nations by establishing trading posts at which Indians could trade pelts for goods, priced at cost. Astor and other independent traders opposed the factory system as a corrupt operation that hindered profitable trade. Along with powerful political allies such as THOMAS HART BENTON and

LEWIS CASS, Astor pushed the federal government to end the factory system, which it did in 1822.

This was neither the first nor the last time that Astor would use financial dominance and political connections to aggressively push the interests of his company in order to eliminate competition. The American Fur Company prompted the federal government to pass laws that excluded foreigners from trade and established official trading locations—both of which favored Astor's interests over those of other companies and individuals. After merging with its main remaining rival, the Columbia Fur Company, in 1827, the American Fur Company finally acquired, if not a monopoly, then at least a formidable financial edge in the fur trade of the United States.

From 1828 to 1834 the company became more systematized and began to look more like a modern bureaucratic business. At their headquarters in New York City, Astor and his son oversaw general operations and supervised the head agents for each division of the company. Ramsay Crooks acted as the company's general manager. Pierre Chouteau, Jr., ran the western department out of St. Louis. Robert Stuart managed the Great Lakes region. Kenneth McKenzie (the former head of the Columbia Fur Company) acted as the main agent in the West, managing the Fort Union post at the convergence of the Missouri and Yellowstone Rivers.

Partly through McKenzie's influence, the company's trappers infiltrated the fur-rich lands of the Blackfoot Indians in 1829. By 1830 they had built a new post, Fort McKenzie, on the Marias River. While these actions secured Astor's hold on the upper Missouri, he still faced challenges in the Rocky Mountains. From 1830 to 1834 the American Fur Company fought another trading war with St. Louis entrepreneurs (WILLIAM HENRY ASHLEY, WILLIAM SUBLETTE, and THOMAS CAMPBELL) who were attempting to take over the Rockies trade. With Astor's financial resources and political clout, his interests eventually won out, and yet another group of rivals were absorbed into his company.

While profits from the American fur trade continued to grow, Astor realized that his business was built on a resource with inherent limitations. The fur trade depended on the accessibility of pelts and the continued demand for fur products. Past experience had shown him that the availability of beaver, bison, muskrat, bear, and other fur was readily affected by environmental factors human agents could not always control. Also, the rise of the textile industry meant that demand for fur to make hats and coats might decline over time. As a businessman interested in maximizing profit, Astor decided to sell out while the trade was still prosperous. He therefore sold his interests in the company to his partners in 1834. The western department, including the upper Missouri outfit, was bought by Pratte, Chouteau and Company. The northern department was purchased by a group led by Ramsay Crooks.

Crooks' group now took the name American Fur Company and continued to do business until 1842. Up to its 1842 failure, the company continued to operate in the region between Detroit, the Ohio River, and the Red River, diversifying from fur trading into shipbuilding and fisheries. The company continued a trading relationship with the West through Pratte, Chouteau and Company (later Pierre Chouteau, Jr., and Company), and attempted to compete with new rivals. The American Fur Company was reconfigured once more in 1846 as a commission house, but it was no longer a viable concern after 1847. Portions of the old company continued to exist until the 1860s, but the fur trade that thrived after the Civil War—most notably the trade in bison hides—was not transacted through the American Fur Company.

The American Fur Company and its subsidiaries were a powerful national (and international) presence for half a century. At the height of its power, the company controlled three-fourths of the American fur trade. As one of the nation's first monopolistic corporations, the American Fur Company set an early example for later American capitalists. Astor's method—using his formidable assets and political influence to intimidate and absorb rivals—became a standard strategy for American industrialists later in the 19th century.

Astor's imperious behavior and questionable ethics also set the standard for his capitalistic successors. His company has often been accused of using alcohol in trade to exploit the Indians. The American Fur Company was certainly not the only firm to use alcohol as leverage, however, and some scholars have pointed out that the trading relationship between Astor's agents and the Indians was not a completely one-sided story of exploitation through addictive commodities such as liquor. Indians were skillful bargainers who knew they had resources and knowledge traders would be willing to pay for. However, this leverage diminished over the first half of the 19th century, partly due to the abolition of the factory system and the forced cession of valuable lands to the United States. Indeed traders like Astor helped instigate a new relationship between Indians and whites that was much more one-sided: As Indians lost their economic clout and homelands through the efforts of interested parties like the American Fur Company, they became vulnerable and thus more easily exploitable.

## American System

The American System was a philosophy of political economy in the 19th century which held that the federal government had a legitimate role to play in spurring economic development and growth. This program of economic nationalism was most closely associated with HENRY CLAY of Kentucky, first a representative and then for many years a senator. Clay borrowed some of his ideas from Alexander Hamilton, the first secretary of the Treasury and a Federalist. Hamilton was the most forceful and prominent spokesman in the early republic for the idea that the national government should take an active role in developing an integrated, commercial economy based in part on manufactures.

Early in his congressional career, Henry Clay had been one of the nationalist WAR HAWKS who pushed for war with England in 1812. He had also been among the majority who opposed the rechartering of the first Bank of the United States in 1811, believing it to be unconstitutional and unnecessary. However, the experiences of the WAR OF 1812, in which the United States struggled to fund its military effort, changed the minds of Clay and many other Republicans, who by the 1820s had formed the National Republican Party. This faction was crucial in the chartering of the SECOND BANK OF THE UNITED STATES in 1816. The war had also highlighted the inadequacy of existing transportation networks, which led to calls for improved transportation after the war.

It was during the administration of President JAMES MONROE that Henry Clay first articulated a program that became known as "The American System." It was in part a response to the changes, economic and otherwise, that the United States underwent after the War of 1812. Manufacturing was increasing, people were moving to cities for work, and there was a growing number of Americans migrating into the Ohio and Mississippi valleys in search of farmland. In 1819 during the crisis over the admission of Missouri as a state, the United States had a serious debate on the question of slavery, which caused some to fear for national unity. The PANIC OF 1819 also convinced some Republicans that the United States needed to provide safeguards against further panics or depressions. Clay and others believed that a series of policies was needed to make the ties between sections stronger and help to forge a more united country. With Clay now a committed economic nationalist as well, the core elements of his American System were (1) a high protective

## 20 American System

tariff to protect U.S. manufactured goods and secure the domestic market against foreign competition; (2) a federal bank to regulate domestic currency and the economy; (3) funding of internal improvements by the federal government, especially transportation networks to better enable the American people to distribute their goods and crops; and (4) the maintenance of a high price for lands that the federal government would sell to companies and individuals. The revenue from these sales would be sent to states to use on their own “internal improvements,” as they were called.

Clay genuinely believed that the American System would encourage a harmony of interests from which all classes and regions would benefit. Much as Hamilton had before him, Clay argued that if the United States failed to develop its own manufacturing capability, it was destined to remain an economic colony of European powers. The lack of a strong manufacturing base to the national economy would place the nation’s ability to defend itself in wartime in jeopardy. Such a situation was unacceptable to Americans who thought of their nation as destined for greatness. Clay believed that his system would benefit American cities, allowing them to become manufacturing and commercial centers and provide a balance in a nation that was still overwhelmingly rural and agricultural. Urban workers would see a raise in wages and jobs less prone to panics. Farmers would benefit as well, as by trading their produce to city dwellers for manufactured goods, their own standard of living, as well as their agricultural outputs, would rise. The improvements in transportation that the American System promised would help goods to move faster and more freely around the country. The Bank of the United States was needed to oversee and guide all of this financial activity and bring needed stability to an increasingly complex economy.

Henry Clay wanted to be president, and he was convinced that his advocacy for the American System would enable him to build a political base in all sections of the country and send him to the White House. Clay’s ambitious plan, however, met with spirited opposition. From the founding of the republic, there had been a great many Americans, both northerners and southerners, who were resolutely opposed to enlarging the powers of government beyond those explicitly given to it in the Constitution. Originally this party, the Republicans, was led by Thomas Jefferson. Although James Madison had signed into law the chartering of the Second Bank of the United States, before he left office in 1817 he had also vetoed funds to help New York build a canal, asserting that the power to do so was not in the Constitution. His successor, JAMES MONROE, also believed that the federal government did not possess such authority under the Constitution. Therefore, Monroe vetoed a plan that would have allowed Washington to administer toll gates on the Cumberland Road. The domi-

nant Republican Party subsequently divided in the 1820s, in part over the proper role of the federal government in making internal improvements.

Despite this formidable tradition in American politics, Clay did have some success in getting Congress to enact into law some parts of the American System. Proponents of the protective tariff passed several measures raising duties on imported goods, including one in 1824 and another in 1828. The latter was described as the “Tariff of Abominations” by its critics and nearly caused disunion, as South Carolina protested bitterly and claimed to have the right to nullify federal laws it believed not in its interest. Clay helped to craft a compromise tariff in 1833 that lowered duties and helped to mollify the South while maintaining the integrity of the Union. By that time, another distinct party, led by ANDREW JACKSON and MARTIN VAN BUREN, had emerged by 1830; they referred to themselves as Democrats. During his successful bid for the presidency in 1828, although Jackson had given the impression in the West that he was not opposed to the American System, over the course of his time as president he came to be a pronounced enemy of its principles. In 1830 Jackson vetoed the Maysville Road bill, which allowed federal monies to buy stock in a private company that was building a road that happened to run through Henry Clay’s state of Kentucky. Jackson based his decision both on constitutional grounds and on the more pragmatic grounds that it benefited only one state. As former president JOHN QUINCY ADAMS described it, the veto was a blow to “the system of internal improvements by national energies.”

Jacksonian Democrats believed that the American System was unjust because it put the federal government on the side of the wealthy and property-owning classes, and what was worse, it called for the government to exercise powers on behalf of the affluent that it did not possess under the Constitution. Some critics of the American System feared that it favored urban growth at the expense of farming interests and denied poorer Americans the opportunity to own land in the West because it promised to keep federal land prices too high. Southerners, led by JOHN C. CALHOUN of South Carolina, were wary of any plan that would bolster the powers of the federal government, which might then turn its increased authority toward the question of slavery. Slave owners also objected to the prospect of paying artificially high prices for manufactured goods, since their own agricultural products would suffer as trade between the United States and Europe declined as a result of the American System. Virtually all opponents of the American System feared that it was bent on creating a new aristocracy, this one economic, and that the creation of a small privileged class would gravely harm the republican ideals of equality before the law and a rough social egalitarianism.

Clay vigorously defended his system as in keeping with the Constitution. Indeed, he saw his plan as embodying the spirit of that document, which was to encourage a more perfect union. He also argued that the “necessary and proper” clause of the Constitution gave the federal government the power to build roads; after all, the same Constitution had created a national post office, the object of which was to deliver mail. This mission, Clay maintained, implied the building of roads and their maintenance, if necessary, by the federal government. Despite this, the American System suffered another serious defeat in 1832 when its opponents succeeded in abolishing the Bank of the United States. With the bank a key issue, Jackson easily won reelection in 1832 over his National Republican opponent, Henry Clay.

In 1834 the WHIG PARTY formed and became the proponent of the American System. But because the Democrats held the White House for most of the remainder of the antebellum period, the Whigs were unable to revive the Bank of United States or keep the price of federal lands high enough to suit them. The nation’s economic growth and expansion continued in the 1830s and 1840s, however, even if the federal role in this process was not quite what Clay and the others had hoped for. Not until after the secession of southern states in the 1860s and then in the decades after the Civil War did Henry Clay’s vision of an economically integrated United States come to pass, as the nation, with federal assistance, moved into an era of great industrial growth and improvements in transportation.

## Amistad incident

The *Amistad* controversy centered around a slave mutiny off the coast of CUBA in July 1839. The African captives who mutinied on board the Spanish ship *Amistad* had originally been transported to Cuba in a Portuguese slave ship sailing from Lombokor, an island off the West African coast. This transport violated the 1817 treaty between England and Spain which banned the trans-Atlantic slave trade. Thus, the contraband Africans were smuggled into Havana after dark. Two Spaniards, José Ruiz and Pedro Montes, purchased 53 of the Africans and sailed with them toward Puerto Príncipe aboard *La Amistad*.

The captives revolted soon after the ship set out from the northern coast of Cuba. Sengbe Pieh (also known as Joseph Cinqué) led the revolt. The captives freed themselves and then strangled the captain and stabbed some of

the crew. Ruiz and Montes were spared, on the condition that they guide the ship back to Africa. Instead of returning them, the Spaniards deceived the mutineers by steering east by day, then west by night, slowly directing the vessel northward. By August the tattered ship had reached U.S. waters off the coast of Long Island near Montauk, New York, where the desperately hungry passengers went ashore to find food. The USS *Washington* discovered them, and the mutineers surrendered after some resistance. The Africans were sent to a New Haven jail, where they would remain for the next two years. News of the *Amistad* case spread quickly, and legal arguments over the fate of the Africans began in the Connecticut courts. Central to these legal proceedings was a conflict between the human right to rebel when held by force and the rights of property owners to recover their property. The same could be said for all legal arguments over slavery, but adding to this controversy was the problem of international laws and treaties. Thus, the fate of the *Amistad* rebels was shaped not only by state courts, but by federal and international concerns over U.S. relations to Spain.

Abolitionists in the United States reacted strongly to the incident, as did southern slave owners. Each side viewed the fate of the mutineers as a statement about the morality of the slave system. Ruiz and Montes maintained that the mutineers had been slaves in Cuba prior to the voyage, and thus as the legal property of the Spaniards, they were subject to punishment for their actions aboard the *Amistad*. Prominent abolitionist LEWIS TAPPAN and others created the Amistad Committee to help defend Cinqué and the other rebels. Tappan argued that the “Mendians” (as they became known because many were from Mende) were illegal captives who had the human right to defend their freedom through revolt.

The committee began to publicize the plight of the captives in an effort to raise money for their defense and promote awareness of the evils of slavery. Along with receiving substantial newspaper coverage, the Mendians were also sketched, and the sketches circulated at abolitionist speaking engagements. With the help of two African-born sailors, supporters were able to communicate with the prisoners, especially with the leader Cinqué. While imprisoned awaiting trial, sympathetic activists taught the Mendians some English and introduced them to Christianity. Tappan secured the services of attorney Roger Baldwin for the upcoming legal battle.

In September 1839 the *Amistad* case was brought before the U.S. Circuit Court in Hartford, Connecticut. This court denied the prisoners’ pleas for release, remanding the case to the higher U.S. District Court. In January 1840 District Judge Andrew T. Judson ruled that the Africans had been illegally kidnapped and sold, in violation of the 1817 treaty. Judson also ruled that, as legally free

This engraving depicts Joseph Cinqué and about 50 other enslaved Africans rising up against the captain and crew of the *Amistad*. (Library of Congress)

people, Cinqué and his followers had the right to revolt against their captors in order to regain their freedom. Judson ordered that the mutineers be returned to Africa.

However, the federal government and President MARTIN VAN BUREN had expected a verdict that would have required the mutineers to be returned to Spain in accordance with Pinckney's Treaty of 1795 between the United States and Spain. Worried that Judson's verdict would provoke further diplomatic tension with Spain as well as southern hostility toward his administration, Van Buren appealed the District Court decision. The Court of Appeals upheld the verdict in May 1840, so the government continued the appeal at the highest level, the U.S. Supreme Court. The attorneys for the *Amistad* mutineers convinced former president JOHN QUINCY ADAMS to address the Court on their behalf. Baldwin's arguments and Adams's stirring address persuaded the Court. Although the majority of the justices (including Chief Justice Roger Taney) were southerners and slave owners, they affirmed the original District Court decision in March 1841 by a margin of 8-1: The mutineers had been kidnapped, which entitled them to use force to free themselves. The sanctity of property did not apply in this case, because the property was taken illegally through fraud and deceit. The rebels were free to return to Africa. Tappan and the *Amistad* Committee began to raise funds in order to return Cinqué and his comrades to Africa. Only 35 of the original captives remained, the others having died in the New Haven jail.

In November 1841 the remaining Africans, their translator, and five white missionaries set sail for Sierra Leone. Cinqué maintained some contact with Tappan after his return, but for the most part historians know little about the fate of the mutineers after 1841. Whether the Africans were able to return to their homelands and families is not known. Cinqué supposedly lived until 1879, com-

ing to the surviving Tappan mission in Freetown to die. Still claiming material damages, Spain continued to ask for reparations from the United States for its lost "cargo." These demands for recompense were drowned out by the sectional controversies in Congress that eventually led to the Civil War.

The *Amistad* controversy itself helped kindle the flames of sectional dispute, pitting human-rights arguments against property-rights arguments in ways that influenced the domestic battle over slavery. The incident did not set a legal precedent that contributed to slavery's demise; indeed, the Taney Court that affirmed the mutineers' rights would go on to rule against the human rights of American blacks in the 1857 *Dred Scott* decision. Nevertheless, the arguments presented by Tappan, Baldwin, and Adams resonated within the antislavery community, and the publicity surrounding the captives helped illuminate the horrors of the slave trade and strengthen the argument for the human rights of African-American slaves.

### anti-Catholic riots

Beginning in the 1820s, the SECOND GREAT AWAKENING, which occurred among mainly evangelical Protestants, included an element of hostility against Catholicism. Some Protestants published novels and tracts which purported to expose the true, and menacing, face of Catholicism to the American public. This burst of religious enthusiasm occurred as the immigration of Catholics into the

United States, mainly from Ireland and Germany, began to increase. These two factors contributed to a revival of traditional American anti-Catholicism, which was an inheritance of European religious rivalries. Between 1830 and 1860 there were numerous acts of group violence directed against Catholics and Catholic institutions.

One of the first such outbreaks occurred in Charlestown, Massachusetts, just outside of Boston, in 1834. A group of Ursuline sisters had established a convent there in 1818, and built a large school for girls on a hill overlooking the town. The size and extravagant design of the school drew much attention. There was also concern that the school enrolled wealthy Protestant girls, who, it was alleged, were held there against their will and were the victims of sexual abuse by Catholic clergy. These rumors contributed to raising the ire of local townspeople who were not Catholic. Adding to the tension was well known Protestant preacher Lyman Beecher, who began a series of sermons in Boston in August of 1834, the theme of which was the alleged threat of the Catholic Church to American republicanism. A group of local workingmen began to plot an assault on the convent and school, and shouting “no popery” and “down with the cross,” burned down the school and an adjacent building belonging to the Ursuline sisters. This successful attack on the Charlestown school was followed by similar episodes in other cities, including New York and Detroit.

In the 1840s tensions between Catholics and Protestants flared up again when Catholics protested against the use of the King James Bible, which was essentially Protestant in character, in public schools. In response, Catholics requested public funds to set up their own private, religious schools. Many Protestants reacted strongly to this, accusing Catholics of using public money for their own purposes and for opposing the use of Bibles in the schools. As the immigration of Catholics from Europe continued into the 1840s, this contributed to fears on the part of some Protestants that the U.S. was in danger of being transformed by the large influx of Catholics, and anti-Catholic literature continued to flourish. In the summer of 1844 Philadelphia became the site of a serious anti-Catholic disturbance. “Native Americans” were encouraged to join a party of that name and fight the alleged threat to American institutions and liberties from the Catholic newcomers. Many of the Catholic immigrants were from Ireland, and they organized as well to prepare for what they believed were impending attacks on their churches and neighborhoods. A large crowd, proclaiming themselves “American Republicans,” marched through an Irish section of Kensington, which was directly north of Philadelphia. They were met there with violence, with one of their number shot to death, possibly by an Irish Catholic sniper. Seeking revenge, nativist crowds reassembled a few days later,

and once again marched through Kensington. They were encouraged by street corner speakers exhorting them to retaliate. Three days of rioting followed, in which nativist crowds burned to the ground three Catholic Churches, many of the homes in the Irish neighborhood, and an Irish fire company house. The fear among Catholics was so great that the bishop of Philadelphia, Francis Kendrick, ordered all Catholic churches in the area to be closed on the following Sunday.

The hysteria soon spread to New York City, which by that point also had several Catholic churches as well and a growing population of immigrant Catholics. Nativists there

This cartoon of Pope Pius IX crumbling the U.S. Constitution captured the fears of American Protestants at the height of Irish immigration in the mid-19th century. (*Library of Congress*)

blamed Catholics in Philadelphia for the disturbances in that city, and urged Protestant New Yorkers to gird themselves for similar trouble. To John Hughes, an Irish immigrant and Catholic bishop of New York City, this seemed to be a pretext for assaults on Catholics and Catholic property. Bishop Hughes issued the statement for which he is best known, warning that “if a single Catholic Church were burned in New York, the city would become a second Moscow,” a reference to the burning of the Russian city in 1812. Acting with his encouragement, more than a thousand Catholics armed themselves and stood guard in front of the city’s Catholic churches. This show of determination appeared to have its desired effect, as nativists, alarmed by Hughes’s threat and the aggressive response of Catholics, called off plans for a mass meeting and the tension eventually dissipated. Disturbed by the violence, bloodshed and destruction of private property in Philadelphia and elsewhere, most Protestant Americans came to see the nativists as dangerous extremists. The immediate physical danger to Catholics ebbed after 1844, but anti-Catholicism remained a part of American political culture, as the rise of the Know-Nothings in the 1850s demonstrated. When an archbishop of the Vatican, Gaetano Bedini, toured the United States in the 1850s, angry nativist crowds burned his effigy in Boston, Cincinnati, New York, and Baltimore, and shots were fired into his hotel room in the latter city. Horrific clashes between Catholics and nativists in Louisville, Kentucky, in 1855 on what is known as “Bloody Monday” in that city’s history, left at least 20 people dead. Along with fears of the slave power and Mormonism, fear of Catholicism was a defining feature of American life in the decades before the Civil War.

### anti-Chinese agitation, rise of

It was the CALIFORNIA GOLD RUSH that first attracted large numbers of Chinese people to the United States, and more particularly to the American West. Chinese emigration from Guangdong Province to “Gold Mountain,” as California was called, had begun in 1851 and reached substantial numbers in 1852, when perhaps as many as 25,000 Chinese came through San Francisco. The majority came as contract laborers, and from the beginning they were the most distinctive of the several groups that came from all over the world in response to the discovery of gold in Cali-

fornia in 1848. Most of these sojourners—for they intended to return to their families and villages as soon as possible—arrived under a system of debt bondage that bound them to Chinese merchants for the price of their passage. They worked to pay this extended credit under such conditions and such terms that the indentured immigrants were slaves to well-to-do Chinese merchants.

Initially the new arrivals worked claims that were considered exhausted. That they would work for less and needed minimal subsistence gave them an advantage in the gold fields that soon generated hostility toward them. Since they worked for lower wages than Euro-Americans, and given the increasing competition in the California goldfields in the 1850s, the Chinese miners were targets for physical intimidation that could escalate into violence quickly. In addition to being mining competition, the Chinese were set apart from other foreign groups; they lived and worked together, they did not associate with other mining groups, they did not learn English, they made no attempts to assimilate, and they were non-Christian. Although they had come on a temporary basis, their financial bondage assured that their stay would be long. The California census of 1860 recorded almost 35,000 Chinese among the state’s population of some 380,000. Of the Chinese enumerated (and the number is probably an undercount because of the difficulty of listing Chinese names), three-fourths were found in the mining counties. The rest were in San Francisco, where they found work in laundries and restaurants or as servants. Indeed, as the rich claims played out, the numbers of Chinese miners probably grew in proportion to the whole, and this only increased the hostility toward them.

Beginning in the mid-1860s, as the mining opportunities diminished, the Chinese took jobs as contract laborers on the railroads under construction across the West. Anti-Chinese feelings then transferred from the mining districts to the cities, especially San Francisco, where they became the targets of xenophobic political campaigns that sought scapegoats for unemployment, low wages, and hard times. Politicians vied with one another to make the most anti-Chinese statements in the course of their campaigns. That San Francisco was a growing city with a seasonal surplus of laborers (especially in winter, when there was an influx of miners into the city) added weight to the charge that Chinese laborers were taking jobs from Americans.

## anti-Masonry

The political and social movement that became known as anti-Masonry burst suddenly on the American scene in the 1820s. Anti-Masonry was a reaction to the Freemasons, who made up fraternal lodges of men active in fields such as commerce, politics, and law, primarily in the northern United States. Masonic groups, or lodges, had existed in the United States since the colonial period but had become more influential in the decades after the American Revolution. Many important leaders of the United States in the early republic were Masons, including George Washington. Masons, who were all men, engaged in a series of somewhat mysterious rituals, including secret handshakes and passwords. They believed that they should do good works for the new nation and inspire a sense of moral virtue and learning among its citizens. At ceremonial events such as groundbreakings and dedication of buildings, Masons were usually very much in evidence, as they laid cornerstones and inscribed them with their insignias. In 1793 for example, President George Washington laid the cornerstone of the U.S. Capitol in the District of Columbia wearing a Masonic apron.

Although Masons considered themselves pillars of republican society, others began to suspect them of having aristocratic and antirepublican tendencies, due in great part to the secretive aspects of their fraternal activities. Masonry was at its peak of influence and membership between approximately 1790 and 1825, when suddenly it became quite controversial. In 1826 William Morgan was a member of a Masonic lodge and a wandering stonemason who moved from city to city in search of work. He became embroiled in a dispute with a lodge in Batavia, New York, and threatened to publish a book that would reveal all the secrets of Masonry. Local Masons, angered by Morgan's threat, had him arrested and thrown in jail on charges of debt. After being released from jail, Morgan was immediately kidnapped by a group of Masons and was never seen alive again. It was generally believed that he was drowned in the Niagara River as punishment for his actions against Masonry.

Many people in western New York were not only shocked by Morgan's disappearance and apparent murder but outraged that local authorities, who were Masons, did not seem particularly eager to investigate and prosecute the case. An appeal by local residents to the state legislature went unheeded, and soon a growing number of residents in western New York became convinced that a conspiracy of silence was at work to protect Masonic wrongdoing. Anti-Masonry as a political movement was born when a growing number of citizens announced that they would support no candidates for office who would not renounce Masonry.

Anti-Masonry appealed to many different types of Americans. There were a number who believed that the

Morgan case was conclusive proof that Masons considered themselves above the law. Masons were becoming an aristocracy of sorts, one that was incompatible with republicanism. Evangelical Christians, swept up in the SECOND GREAT AWAKENING that took hold in western New York and other parts of the North, found Masons to be a threat to Christianity. Anti-Masons decried the practice of meeting in secret, away from families, in places where alcohol was thought to be served. These practices offended those who were active in the various benevolent and reform movements, such as temperance (antialcohol) and sabbatarianism (those who wanted to keep Sunday free of commercial activity) that stemmed from the Second Great Awakening.

Anti-Masonry grew so rapidly in popularity in New York State that it began to be seen by some as a vehicle for opposing the Albany regency, the political faction of MARTIN VAN BUREN and the Democrats. The movement also spread into Ohio and Pennsylvania, as well as parts of New England. By the 1830s there were more than 100 anti-Masonic newspapers throughout the North. The anti-Masons by that time had become a genuine political party, winning state legislative seats in New York, and in the 1830s they elected governors in Vermont and Pennsylvania. There was little anti-Masonic activity in the South, however, nor in western states such as Illinois and Missouri. Even so, ambitious anti-Masons set their sights on national power. In 1831 they held what is generally regarded as the nation's first modern political convention, meeting in Baltimore to nominate William Wirt, a former attorney general, for president. Although not entirely committed to anti-Masonry, Wirt accepted the nomination as much out of ambition as principle. He won only Vermont's seven electoral votes in the 1832 presidential election, and about 8 percent of the popular vote nationwide. Much of his support appears to have come from voters who disliked the Jacksonian Democrats but saw National Republican candidate HENRY CLAY as morally compromised.

Anti-Masonry fell quickly from its peak of popularity and influence in the early 1830s. When the WHIG PARTY formed in 1834 in opposition to the Jacksonian Democrats, most anti-Masons joined it. Although that signaled the end of anti-Masonry as a formal political movement, their crusade was successful in that many Masonic lodges across the North closed in the 1830s as a result of the public pressure that anti-Masons brought to bear on them.

**Applegate, Jesse** (1811–1888) *settler, expedition guide*  
A pioneering figure of the Oregon Territory, Jesse Applegate was born in Kentucky on July 5, 1811, the son of a Revolutionary War veteran. He relocated with his family to Missouri at the age of 10 and was subsequently educated at the Rock Springs Seminary in Illinois, where he displayed considerable aptitude for surveying. Applegate eventually settled in St. Clair County, Missouri, where he farmed, surveyed, and raised his large family.

A Whig by inclination, Applegate adamantly opposed SLAVERY. Because slavery was then a growing factor in the region, in 1843 he joined the migration of 1,000 people who trekked to what was then known as Oregon Country to begin new lives. This was the first group of settlers to take wagons along the OREGON TRAIL as far as the COLUMBIA RIVER. Applegate was entrusted with conducting the cattle-heavy “Cow Column” during the migration. He settled at Salt Creek and in 1845 gained election as a delegate to the region’s provisional government. In this capacity he penned a noted petition to the federal government for funds to help the region’s development and also requested admission as a U.S. territory. Blunt and honest to a fault, Applegate enjoyed great success negotiating with British residents and secured their support for the provisional government. In 1844 he was appointed surveyor general in American parts of the region, despite his fearsome temper and prickly independence.

By 1846 Applegate became convinced of the need for an easier route to the Willamette Valley. In that year he uncovered a southern route from Fort Hall, Idaho, through Nevada and northern California. While in the process he observed a new valley in south-central Oregon that he dubbed the Yoncalla; he relocated his family there in 1849. Applegate continued farming and surveying, but he also gained local renown as a man of letters who published on a variety of political subjects. His opinions became much sought after. In 1857 he served as a delegate to Oregon’s constitutional convention as a Republican, but he quit in disgust after the legislators refused to abolish slavery. Returning to private life, Applegate remained active in party politics and helped secure the party’s vote for Abraham Lincoln after 1860. He also found the time to serve on a board responsible for settling disputes with Britain’s Hudson’s Bay Company, which he did with his usual honesty. Applegate never again sought public office, but he remained highly respected as one of the founders of his new state. He died in Yoncalla Valley on April 22, 1888.

**Armijo, Manuel** (ca. 1792–1853) *farmer, leader in the Navajo War*

The last Mexican governor of New Mexico, Manuel Armijo was born in Albuquerque, New Mexico, around 1792, to wealthy landowners. He served competently as a lieutenant in the militia, acquiring a reputation for sound administration, and in 1824 he served as the *alcalde* (chief administrator) of colonial Albuquerque. Three years later Armijo gained appointment as governor of New Mexico, where he confronted a host of problems, including hostile Apaches, low tax revenues, American fur traders smuggling goods into the territory, and increasing numbers of traders along the SANTA FE TRAIL who dodged the tax on imports. He handled himself capably but, suffering from an old leg wound, resigned from office in 1829 and returned to Albuquerque.

Armijo functioned as a trader for the next seven years and amassed great wealth, reputedly through corrupt bargaining with Mexican officials, local merchants, and American traders. In 1837, however, a rebellion against new taxes led to the death of Governor Albino Perez, so Armijo raised a private army, marched on Santa Fe, and defeated the rebels. As a reward, officials in Mexico City appointed him to a second term as governor. Once again he performed well as an administrator, and in 1841 he gained a degree of notoriety when he ambushed and captured a 300-man TEXAS expedition intending to seize eastern New Mexico and annex it to the Republic of Texas. The prisoners were then marched south to Mexico City for trial under brutal conditions, which did little to enhance Armijo’s reputation among Americans with whom he dealt. Throughout his tenure he also parceled out a greater number of land grants than any previous governor, including many to American businessmen in his inner circle.

Armijo retired from the governorship a second time in 1845 on account of ill health, but dissatisfaction over his successor, Mariano Chavez, led to his reappointment for a third term as governor the following November. Once the MEXICAN-AMERICAN WAR commenced in 1846, he was secretly warned by the wealthy Santa Fe trader JAMES W. MAGOFFIN that an American column of 1,700 men under General STEPHEN W. KEARNY was en route to Santa Fe from Kansas, and that resistance was foolish. Armijo nonetheless rallied the local militia and prepared defensive positions, but at the last minute he dismissed the levies and withdrew south with his

bodyguard. He was arrested in Chihuahua and charged with treason, but as his position was essentially hopeless, Armijo was released by the court. He subsequently returned to New Mexico to work as a rancher and died there on December 9, 1853.

### Aroostook War

The Aroostook War was an undeclared 1838–39 conflict between Maine and New Brunswick over contested territory in the Aroostook Valley (now Maine). It was resolved peacefully, with no violence or bloodshed.

The 1783 Treaty of Paris, which ended the American Revolution and established the United States as an independent nation, was vague on a number of boundary questions. One of these disputed regions was the Aroostook area north of the St. Croix River, a 12,000-square-mile piece of sparsely settled but timber-rich land, larger than the entire state of Massachusetts. The region was claimed by both the U.S. state of Maine and the Canadian province of New Brunswick. Neither of the central governments of Britain or the United States was much concerned about the inexactitude of the area's official borderline—after all, it took more than half a century for the matter to come to any sort of a head. But to local residents, especially after Maine achieved statehood in 1820, the boundary question was one of national importance and a matter of state honor. In an era when states' rights had come to the fore, this question demanded important consideration. In fact, it was Mainers' indignation over the national government's failure to resolve the Aroostook dispute that very nearly drove them to violence.

The new state of Maine had begun to grant parcels to settlers in the Aroostook Valley after 1820, despite New Brunswick's claim to the land. When Canadian lumberjacks began logging the area in the winter of 1838–39, the dispute finally boiled over. A Maine land agent, Rufus McIntire, attempted to send the Canadians home, and the loggers seized him in February 1839. That was enough for Maine to raise a 10,000-man militia and send it marching north. New Brunswick called up its own militia. The U.S. Congress authorized \$10 million in spending for a 50,000-man contingent, and dispatched General WINFIELD SCOTT to Maine.

Scott quickly managed to negotiate a truce, and by March 1839—before any U.S. troops had had a chance to arrive, much less engage in battle—the “Bloodless Aroo-

stook War” was over. But it was not until the WEBSTER-ASHBURTON TREATY (1842) that the border question was settled. In the end, more than half of the disputed territory was awarded to Maine, and both the United States and New Brunswick were given navigation rights on the St. John River. New Brunswick retained the northern part of the territory, thus preserving communication routes among the eastern Canadian provinces. Britain agreed to pay \$150,000 to Maine and to Massachusetts for their lost land, and the U.S. federal government was to reimburse those states for the funds they had spent on the region's defense.

### art and architecture

In the United States, the decades between 1810 and 1860 were a time of energy, invention, creativity, and accomplishment. It was also an exciting and inventive period for the arts, which reflected or reacted against remarkable changes happening in the nation. More than anything, American artists and architects of the antebellum period sought to free themselves from conventional and contemporary European dictates in taste and to establish their own uniquely American style of creativity.

#### Art

If American culture was still rooted in a European heritage, there was nevertheless a unique quality about the land. Unlike Europe, the United States seemed to have unlimited land available to all citizens, regardless of class. A romance grew out of the land, out of Americans' relationship to it, and out of their accomplishments on it.

In the East, Americans became nostalgic for a wilderness they knew they had lost to progress, as forests were cleared, factories rose, trestle bridges crossed rivers, and trains cut through the landscape. The doctrine of Manifest Destiny dictated that progress must take place across the land if America's future were to be fulfilled, and in the 19th century, few who went west doubted the rightfulness of their mission. As early as 1804, the painter Washington Allston (1779–1843) grappled with the notion of breaking free from his traditional European training and exploring new tableaux. He sought to bridge the two prevailing schools of painting: traditionalism, in which nature and objects are faithfully and realistically reproduced, usually couched in some kind of moral message, and romanticism, an emerging approach that impelled artists to color their works by

what they felt as well as what they beheld. Allston's subsequent body of work represents the first American attempt to meld a universal moral message with the personal subjectivity of an artist. His work pleased homegrown critics and greatly influenced the next generation of painters.

From about 1825 Americans wanted images of the land itself: its mountains, forests, prairies; the lives and customs of the Native Americans who dwelt in it; the adventurous men and women who moved into and settled it. To some the landscape became a metaphor for moral, religious, and poetic sentiments, and so it must be preserved. To others it represented the American Dream because of the opportunities it offered, and so it must be utilized. Some saw interminable forests as a biblical Eden, awaiting a new Adam and Eve in the form of the American pioneers, who had a chance to regain grace in a land uncorrupted by the Industrial Revolution.

The patrons of these artists were often prosperous merchants, bankers, or factory owners, desiring scenes of natural splendor as an antidote to the harsh world of business; or rural scenes reminiscent of the days spent on the farm, when life was slower and easier—somehow better. Armchair travelers enjoyed paintings of the exotic West, which they might never see for themselves. To satisfy this

*Kindred Spirits*, painting by Asher B. Durand, 1849 (Library of Congress)

demand, a large and talented corps of landscape artists emerged to paint essentially naturalistic visions altered by romantic sentiment. Landscape painting before 1825 had been sporadic, often quite good, but generally lacking a strong thematic focus. After 1825, it enjoyed a great flowering.

The initial impetus for an American school of art arose in the intense nationalism that followed the WAR OF 1812, when a number of cultural institutions that were dedicated to cultivating a unique national aesthetic were established. The first such organization was the National Academy of Design, created in New York in 1826 by the painter SAMUEL F. B. MORSE (1791–1872). Morse was one of a group of dissident artists who rebelled against the restrictive mores of the older American Academy of Fine Arts. The National Academy of Design was founded and run entirely by artists, and it limited exhibits to contemporary American painters, sculptors, and related artisans. Its success inspired Philadelphia's Artist Fund Society in 1835 and New York's American Art Union in 1838, both committed to showcasing American art exclusively. Within a decade the latter boasted 18,000 members and several thousand visitors in daily attendance.

The first American school of landscape painting was the Hudson River School. Many of these artists painted in and around the Hudson River Valley and the nearby Catskill and Adirondack Mountains. Beginning with the works of Thomas Cole (1801–48) and Asher B. Durand (1796–1886), the Hudson River painters helped to shape the mythos of the American landscape. At the time America was a nation yearning for artistic identity. The Hudson River style provided what Americans craved; dramatic and uniquely American landscapes. Artists, along with poets, novelists, and essayists, delighted in describing and depicting native scenery. Influenced by 17th-century European landscapes, the work of the Hudson River School is characterized by panoramic views rendered with precise detail. These serene and awe-inspiring vistas, in which a small figure often communes with nature, were intended to evoke elevated thoughts and feelings. With roots in European romanticism, the Hudson River painters, nonetheless, heeded RALPH WALDO EMERSON's call "to ignore the courtly Muses of Europe" and define a distinct vision for American art. The artists who came to maturity in the years of egalitarian Jacksonian democracy and expansion translated these ideals into an aesthetic that was sweeping and spontaneous. Sharing the philosophy of the American transcendentalists, the Hudson River painters created visual embodiments of the ideals set out in the writings of Emerson, HENRY DAVID THOREAU, William Cullen Bryant, and Walt Whitman. Concurring with Emerson, who had written in his 1841 essay, *Thoughts on Art*, that painting should become a

vehicle through which the universal mind could reach the mind of mankind, the Hudson River painters believed art to be an agent of moral and spiritual transformation. A painting that has become a virtual emblem of the Hudson River School is the dramatic canvas by Asher B. Durand entitled *Kindred Spirits* (1849). In it Durand depicts himself, together with Thomas Cole, on a rocky promontory in serene contemplation of the scene before them, the gorge with its running stream, the Catskill mists framed by foliage. Tiny as the human beings are in this composition, they are nevertheless elevated by the grandeur of the landscape in which they are in harmony.

But America's fascination with landscapes was not solely confined to the eastern part of the nation. As America expanded beyond the Allegheny Mountains into the Great Plains, the arts soon followed. The frontier had its own chronicler in George Caleb Bingham (1811–79), who took his inspiration from the spirited life along the Missouri and the Mississippi Rivers. Bingham's work comes into historical focus with *Fur Traders Descending the Missouri* (ca. 1845). In the golden haze of a misty dawn, a French trader and his half-breed son move along the mirror-placid waters of the great river in a dugout canoe. They wear the typical colorful costumes of their culture, and have a wild-animal pet tied to the bow. Bingham saw something exciting and exotic in the men who lived in the solitary wilderness of the upper Missouri, running their traps or trading with Native Americans, and he captured the romance surrounding them. Pictures like this depicted a new type of folk hero, created by the land itself. Europe had no counterpart, and so here was a subject that was uniquely American.

Another significant school gaining popularity was genre painting, which, by 1840, proved equally as popular as landscapes and portraiture. Genre painting embraced the depiction of everyday life and activities by average, anonymous people. Farmers, frontiersmen, and riverboat men all figured prominently on the canvas, because in their simplicity and commonness they embodied the uniquely American sense of individualism and optimism about the future. Their usual placement in a frontier setting also celebrated both humans' mastery of nature and a pristine, idealized concept of the West. The most important artist of this genre was John Lewis Krimmel, a native of Germany who immigrated to the United States in 1809 and settled in Philadelphia. Krimmel first worked for his brother, a merchant, but he soon left business to pursue a career as an artist. In the course of his significant but brief artistic life (he accidentally drowned in Germantown, Pennsylvania, in 1821), he painted scenes from daily life, and he was probably the first American artist to do so. Among the paintings that he exhibited at the Pennsylvania Academy in 1813

were *Quilting Frolic* (a very American subject) and *The Blind Fiddler* (adapted from Sir David Wilkie's English painting of the same name, but given an American identity). Krimmel was the first painter of American scenes (he never became an American citizen) whose reputation rested on his adaptation of contemporary American life as an appropriate subject for an American artist.

As some American artists pursued American subjects, African-American artists found themselves severely restricted in artistic life, as they were in all aspects of civil and professional life in the United States. While their chances of pursuing careers as artists were severely circumscribed, they did find opportunities for artistic expression in painting signs, firebuckets, and helmets.

### Architecture

The period 1825–70 produced an architecture that can only be described as romantic and eclectic. Architects adapted Greek, Roman, Gothic, Oriental, and Egyptian styles to suit American ambition, ideology, or institutions, as well as nationalistic, religious, or moral sentiments. The range reached from austere classicism to picturesque Victorian “gingerbread.” New technologies and materials, such as cast iron, were forced into old forms, as in the classical dome of the enlarged U.S. Capitol. While popular in some circles, this eclectic style of architecture usually clashed with contemporary European practices. Neither approach fully excluded the other, and the debate they occasioned in architectural circles went unresolved. Curiously, devotees of the new national architecture were either self-taught or trained in Europe, as formal education in this discipline did not begin at home until after the Civil War.

The Greek Revival in America spanned the years 1820 to 1845. From the design of chairs to the style of women's dresses, the Greek mode was enormously popular. Americans identified strongly with the Greek cause when in the 1820s Greece fought to free itself from the Ottoman Empire and Turkish despotism. The Greek War for Independence was associated with America's own valiant struggle of a few decades earlier. Americans also recognized in Greece the cradle of democracy and the fountainhead of learning, culture, and the arts. To design a chair or a building in the Greek mode was to pay allegiance to the democratic spirit and to the timelessness of Western culture. For much of the mid-19th century, the Greek Revival style dominated residential and public architecture. Many European-trained architects designed in the popular Grecian style, and the fashion spread via carpenter's guides and pattern books. It was so popular it became known as the National Style. William Strickland (1788–1854) contributed greatly to the rise of the Greek Revival style in America. Strickland was the designer of the SECOND BANK OF THE UNITED STATES building in Philadelphia,

which is a classic example of the American Greek Revival style. Strickland's influence extended from his designs to his instruction of a new generation of young architects. Among those who studied with him was Thomas Ustick Walter (1804–1887). Born in Philadelphia, Walter made the transition to architect about 1830, after several years as an apprentice in the building trades and of study with Strickland. Among his most important buildings were Girard College (1833–47) and the extension of the U.S. Capitol (1851–59). The work over his long career eventually included some 400 designs, most of them classical residences and churches.

The model for Greek Revival architecture was the ancient Greek temple, in which a series of columns support a horizontal superstructure called an entablature and a triangular pediment. (The pediment of a temple is the narrow end of a gable roof forming a triangle, often filled with a decorative relief.) In the United States, the style was based on the Greek orders: sets of building elements determined by the type of columns that were used. The columns ranged from the simple Doric, with a fluted shaft; the Ionic, with a capital shaped like an inverted double scroll; and the Corinthian, with a capital shaped in an elaborate leaflike form. The shape of the building was rectangular, with columns placed in various ways. They could be at the front of the building, full height, down the side, or all around it, and frequently they were indicated by pilasters at the corners or elsewhere on the building.

Brick and stone were the favored materials, though wood was often used and covered with a thin coat of plaster, then scored to resemble stone. The doorway was usually impressive. Paired columns with a pediment over the door, transom lights, side lights, and pilasters against the wall were all used to embellish the entry. Windows were often floor-length, double- or triple-hung. There were also often small horizontal windows set in a row under the cornice and sometimes covered by a decorative wooden or iron grille. In the early to mid-1800s Greek temples appeared everywhere from Maine to Mississippi. Colonnaded Greek Revival mansions—sometimes called Southern Colonial houses—sprang up throughout the American South. With its classic clapboard exterior and bold, simple lines, Greek Revival architecture became the predominant housing style in the United States. The public proved entirely receptive to the style, so Greek Revival was applied to all manner of buildings, including banks, courthouses, city halls, and even farmhouses. Its widespread acceptance and application render it the first truly national architectural style.

The most enduring legacy of the Greek Revival style is the gable-front 19th-century farmhouse, often ornamented by only a flat pilaster doorway or corners. Usually called the New England Farmhouse, this became a popular form

for detached urban houses in cities of the Northeast until well into the 20th century. In rural areas, the form of Greek Revival known as gable-front and wing (called, similarly, New England Farm) remained a popular form for farmhouses until the 1930s.

During the second half of the 19th century, Gothic Revival and Italianate styles captured the American imagination, and Grecian ideas faded from popularity. Most American Gothic Revival houses were built between 1840 and 1870. The Gothic Revival began in England and became the dominant style for country houses there. After it became accepted for English church building, it was promoted as the popular style for all English buildings from 1840 to 1870. In contrast to the ordered symmetry of Greek Revival, churches constructed as Gothic Revival were decidedly upswept and asymmetrical, with high pointed arches, steeples, and pinnacles much like their Medieval progenitors. Americans also liked this form, but only as one of several romantic styles to be modeled to Victorian American tastes.

The most important architect associated with the Gothic Revival style was Richard Upjohn. Born in England in 1802, in 1829 he immigrated to the United States, where he first worked in the building trades and, beginning in 1833, advertised himself as an architect. Among his first commissions were requests from the city of Boston to design street lamps and cast-iron fences and gates for the Boston Common. Upjohn's first important work was Trinity Church in New York City, which was a landmark Gothic Revival style and established Upjohn as one of the leading architects in the nation. Over the next 20 years, Upjohn designed a score of major churches and numerous minor ones, and in addition, he extended the Gothic style to domestic buildings. In 1852 he published *Upjohn's Rural Architecture*, in which he laid out a wide range of plans from cottages to churches for individuals and congregations unable to afford his personal services. Upjohn's eldest son, Richard Mitchell Upjohn, joined the firm in 1846, and in the 1860s the elder Upjohn gradually retired in favor of his son.

As a result of the economic opportunities of the Industrial Revolution, the growing middle class had more money to spend on housing and wanted to build attractive homes outside the cities in healthy surroundings. Horse-drawn railcars brought the man of the house to and from work, gas lights and indoor plumbing were becoming available, and all sorts of new devices and household machines (including iron cook stoves) were being invented. With these developments, the Gothic Revival bloomed. Perhaps the style achieved its greatest and most famous expression in St. Patrick's Cathedral in New York City, which was designed by James Renwick (1818–95) and constructed from 1858 to 1879. The Gothic Revival style briefly faced competi-

tion from the more ornate Romanesque Revival style of the 1840s. The Smithsonian Institution in Washington, D.C., also designed by Renwick, is a prime example of Romanesque Revival architecture.

Alexander Jackson Davis (1803–92) was the first American architect to champion Gothic domestic buildings. Works by him include the New York Customs House (1832), now the Subtreasury; the state capitols of Indiana (1832–35), North Carolina (1831), Illinois (1837), and Ohio (1839); and a number of villas along the Hudson River, including Lyndhurst (1838–42).

But it was Davis's friend Andrew Jackson Downing (1815–52) who expanded the Gothic Revival movement with pattern books and tireless public speaking about the virtues of the style. Previous publications had shown details, parts, pieces and occasional elevations of houses, but Downing's book *Cottage Residences* (1842), was the first to show three-dimensional views complete with floor plans. The Gothic Style fed public fascination with the romance of the medieval past. Downing's books—including *Architecture for Country Houses* (1850)—offered not only designs for houses but also site and landscape plans to ensure a "happy union." Downing is considered the founder of landscape gardening in this country. While Frederick Law Olmstead (1822–1903) dealt with the grander landscapes on a larger scale, Downing dealt more with American middle-class homes and emphasized gardening and plants, as he was also a nurseryman. Like those of Olmstead, his landscapes were influenced by the English style and were natural in appearance, as he described in his book *The Theory and Practice of Landscape Gardening* (1841).

**Ashley, William Henry** (1778–1838) *American fur trader, soldier, politician*

Born in Chesterfield County, Virginia, in 1778, William Henry Ashley moved to Missouri in 1803, soon after the Louisiana Purchase had taken place. Over the next generation, he was a fur trader, land speculator, and politician. As a fur trade entrepreneur, Ashley outfitted expeditions that covered much of the Rocky Mountains and plateaus of the West. Ashley also organized the brigade system of trapping, including the annual RENDEZVOUS that would become associated with the emergence of free trappers and MOUNTAIN MEN as features of the American fur trade.

After Ashley settled in Missouri in 1803, he manufactured gunpowder and lead, items that became enormously profitable during the WAR OF 1812. As a result, when the war ended, he was a wealthy man. Ashley was also a prominent figure in the territorial (and later state) militia, where he was elected lieutenant colonel during the war and later rose to the rank of brigadier general. He would later use this title to enhance his political career, and when Missouri entered the Union in 1821, he was elected lieutenant governor.

Like many others, Ashley's economic circumstances suffered in the PANIC OF 1819, and he sought opportunities to recoup his losses. Even as he served his state in its second highest office, he remained active in fur-trade ventures. In 1822 Ashley and Andrew Henry advertised in the Missouri Gazette for "enterprising young men" to undertake an expedition into the upper Missouri. When eventually formed, the expedition was financed by Ashley and led by JEDEDIAH STRONG SMITH. Although the party of veteran fur traders penetrated as far as the Missouri's junction with the Yellowstone River, where they established Fort Henry, the opposition of the Arikara Indians was too strong. A second expedition the following year was ambushed by the Arikara, with the loss of a dozen trappers.

Concluding that the Missouri was too dangerous, Ashley sought other routes to the fur sources of the Rocky Mountains. His solution was to dispatch parties on horseback overland to the Rockies; these groups of trappers were called "brigades." One of the first overland parties, under Henry, traveled across Nebraska to reach Fort Henry on the Yellowstone. Another, under Jedediah Smith, went by way of the Black Hills to the Wind River Mountains. In early 1824 Smith's party discovered South Pass (previously discovered by Robert Stuart in 1812), which was to become a key route through the Rockies on the overland trail to California and Oregon. Ashley soon followed Smith to the rich, fur-bearing streams of the Green River Valley. He subsequently redirected the fur trade away from Canada and his main rival, the Hudson's Bay Company, and into the southern areas of the Louisiana Territory.

In autumn 1824 Ashley started out from St. Louis with supplies for the trappers who were to remain in the mountains for the winter. His pack trains succeeded in making their way through the winter snows. In April 1825 his trappers dispersed to travel and trap in small groups, agreeing to meet on the Green River in the summer of 1825 (at the close of the trapping season). The first celebrated rendezvous was held near Henry's Fort on the Green River. It was to be followed by a series of annual rendezvous, in which trappers would convene at an agreed site to drink, gamble, fight, and generally make merry, and to trade their furs for Ashley's supplies. Ashley then brought the furs out of the mountains by pack train. The annual rendezvous continued in the Rockies until 1840. Ashley was present at the first two but after the second, in 1826, he sold his business for \$16,000 to Jedediah Smith, David E. Jackson, and the William L. Sublette Company. This company was, in turn, succeeded in 1830 by the ROCKY MOUNTAIN FUR COMPANY. Although he had left the business and no longer par-

ticipated in the annual rendezvous, Ashley remained active in the fur trade by handling financial matters for various St. Louis companies.

Ashley's strategies changed the direction of the fur trade. Previously, trappers had been forced to sign on for service in large companies, for only such an arrangement could provide supplies on credit and physical safety in numbers during the trapping season. In return, the trappers agreed to sell their furs to the company at a specified price. Amidst this large-scale organization, so-called free trappers or free traders were rare. Ashley revived the free trappers by giving them a support and safety system in the form of brigades and supplies provided in the field. Aside from the high degree of business acumen he displayed, Ashley also understood the demands of the trappers from personal experience. His presence on the expeditions and at the first two rendezvous made him not only a planner but also a participant. Furthermore, in addition to his use of free trappers in brigades and horses as transportation,

his system supported St. Louis in its continuing connection to the fur trade, bounded on one side by the Hudson's Bay Company and on the other by the financial colossus of JOHN JACOB ASTOR'S AMERICAN FUR COMPANY. Ashley's personal bravery and ingenious business strategies for putting men in the field and supplying them made St. Louis an important city in the fur trade. Ashley himself was one of the first St. Louis-based businessmen (as opposed to Astor in New York) to make a fortune in furs.

Upon his retirement from the fur trade, the wealthy Ashley settled in St. Louis, where he pursued other trading and banking interests as well as politics. In his revived political career, he had the misfortune to be a dedicated member of the WHIG PARTY at a time when the Jacksonian Democrats had a large majority following in the state of Missouri. As a man of strong principles, Ashley refused to change his political allegiance, and he continued to campaign as a Whig throughout the next decade. As a result he failed in his campaigns for governor and senator, although he was elected to Congress for three terms, serving from 1831 to 1837. In the House of Representatives, he devoted himself to what he regarded as western interests, especially western expansion and the fur trade. Ashley also ran unsuccessfully for governor twice. He intended to run for Congress again when he was suddenly taken ill and died in 1838.

Although he was slight of stature, Ashley was acknowledged by those in the fur trade as brave and daring. He was also a natural leader in the field, perhaps reflecting his service in the militia. His business methods were enormously creative in an enterprise that had become increasingly the monopoly of two large groups, the Hudson's Bay Company and Astor's American Fur Company. Through such innovations as the trapping brigade and rendezvous, Ashley made St. Louis an important city in the fur trade. Furthermore, the geographic discoveries of those trappers in his employ would be significant in subsequent expansion across the continent.

**Astor, John Jacob** (1763–1848) *fur trader, merchant, entrepreneur*

The son of a poor butcher in Waldorf, Germany, John Jacob Astor was born on July 17, 1763. He would become America's most notable fur trade entrepreneur, and at his death, its wealthiest citizen. Astor's early life paralleled noteworthy changes in the continent of North America that would directly influence his career. Born at the close of the

French and Indian War, in 1780 he immigrated to Great Britain, where he joined his brother George. He worked for his brother for three years, during which he learned English and saved his money for emigration to the United States.

Astor crossed the Atlantic in 1783, the same year that the Treaty of Paris confirmed America's independence. Because his vessel remained icebound in Chesapeake Bay for two months, it was not until March 1784 that Astor reached New York City, where he joined his brother Henry. Although he brought with him a modest capital in flutes, Astor's future was not in musical instruments but in the fur trade. He soon found a position in a fur store in New York City, where for two years he learned how to purchase furs in upper New York State and ship them through New York City to London. It was a lucrative business, and within two years, Astor had set up his own business.

After Jay's Treaty (1794) forced the British evacuation of the frontier posts in the Northwest Territory and reduced tensions and trade restrictions between the United States and Canada, Astor began to trade with the North West Company in Montreal. His business prospered, profiting from his astute negotiations with suppliers and his knowledge of the fur business in New York City. By 1800 he had amassed a fortune of \$250,000, making him the leading fur entrepreneur in America. It was about this time that Astor began to ship furs to China; the first trading voyage to Canton netted him \$50,000. He also made his first large purchase of New York real estate when in 1803 he bought 70 acres at the northern edge of the city, a tract that would become the heart of one of his several fortunes.

After President Thomas Jefferson acquired the Louisiana Territory from France in 1803, he dispatched Meriwether Lewis and William Clark to explore the region. Astor immediately recognized the significance of both the purchase and the expedition for the fur trade. Lewis and Clark crossed the continent to the Pacific Coast (1804–06) through some of the richest fur-bearing landscape on the continent, and Astor fully intended to exploit their discoveries. In 1808 he founded the AMERICAN FUR COMPANY as a corporation chartered by the state of New York for \$2 million; Astor owned all the stock. At this time, the fur companies of St. Louis (the largest in the West) were each capitalized at less than \$25,000.

Astor's strategy, as it developed over years, was to establish a post at the mouth of the COLUMBIA RIVER, from which his employees would trade with Indian peoples throughout the reach of the Columbia and its tributaries. Astor's ship would then carry the furs gathered at the mouth of the Columbia to Canton, where they would be sold to Chinese merchants. The goods acquired there would be traded in Europe, and eventually the profits

would accrue to Astor in New York City. Astor calculated that on an annual basis, a single supply vessel would be sufficient to support the operation in the Pacific Northwest. In 1810 he organized the Pacific Fur Company—a direct competitor of the North West Company (Montreal) and the Hudson's Bay Company (London)—and recruited and dispatched two expeditions to the Pacific Coast. His employees founded ASTORIA at the mouth of the Columbia River in the spring of 1811, acquiring a key location in the fur trade for transshipping furs to Canton, and providing testimony to the capital that Astor was willing to invest. His triumph was brief. News of the declaration of war with Great Britain reached Astoria in January 1813. In autumn of that year, Duncan McDougall, head of Astor's operations, sold the fort and the surrounding tract of land to representatives of the North West Company for \$58,000. This sum represented only a fraction of Astor's investment. Within little more than a month, a British warship arrived at the mouth of the Columbia, and on December 12, 1813,

John Jacob Astor (Hulton/Archive)

its captain took possession of the region and renamed the post Fort George, to honor the British monarch.

Although Astoria was a severe financial loss, in other respects Astor found the war very profitable. His Manhattan real estate holdings rose in value throughout the conflict. He also profited enormously from a large loan to the federal government. By 1814 the American government was in a desperate financial situation. The WAR OF 1812 had been fought on credit, and in the face of military reverses, finances had become tight. Along with two Philadelphia bankers, Astor bought a large block of loan bonds from the government at 80 cents on the dollar. He then paid for the bonds with notes worth approximately half their face value. The war ended in less than a year, and Astor made a fortune from the government bonds. Although he always thought of himself as a patriotic citizen, he considered the war another of a series of business transactions, and he saw no reason not to take advantage of generous terms.

At the close of the war, Astor turned once again to the fur trade. The TREATY OF GHENT, signed in 1814, specified that territory seized during the war should be returned. As a result, Astor sued for the return of Astoria, but the British government argued that Astoria had been sold, not seized. In a technical sense, this was true, but Astor was able to show that the purchase price represented only a fraction of his investment. His case won, Astoria was once again in his hands.

When Astor had lost the outpost in the Pacific Northwest, he had also lost a considerable investment with it. No other entrepreneur associated with the fur trade could have absorbed such losses and remained in business. Whatever the size of Astor's operations—and they were huge—his company was an American concern at a time when the major competitors were British or Canadian. Thus, American officials at many levels applauded his aggressive plans as something that served the national interest. In 1816, at his urging, Congress passed a law that excluded foreigners from engaging in fur trading on American soil except as employees.

Astor also used his immense political power to force the U.S. government out of the fur-trade business. Under legislation passed in 1795, Congress had created a factory system through which the federal government established factories, or trading posts, to serve as a model of honest and ethical practices with Indian peoples. These government posts would offer high-quality goods at reasonable prices but without alcohol. However idealistic the concept, Indians continued to trade at the private posts, preferring traders as friends to doing business with government employees. Astor resented the federal competition, however mild. In 1822 Congress succumbed to the powerful political influence of the private American fur-trading companies and Senator Thomas Hart Benton of Missouri, the representa-

tive of fur interests in the Senate. Consequently, the private companies, reduced in number by fusion (including the melding of the North West Company and Hudson's Bay Company by Act of Parliament in 1821) but strong in influence, had the field to themselves.

After the War of 1812, Astor extended his trading operations to control the fur trade from the Great Lakes to the Ohio River. He established a key post at Mackinac, through which he expanding his trading operations into the upper reaches of the Mississippi and Missouri Rivers. To pursue this end, in 1822 he established the western department of the American Fur Company. In so doing, he gained a virtual monopoly of the fur trade in the upper Missouri country, and his operations bankrupted many small traders.

For years, Astor was hated and feared by the St. Louis fur-trade interests, which were much smaller operations. Although one of Astor's great skills as an entrepreneur was reaching an accommodation with the competition, he was never able to do so with the traders in St. Louis. Astoria and his plans for the Pacific Northwest bypassed these competitors, but his expanded operations in the 1820s brought him increasingly into direct competition with the St. Louis companies. He mounted a direct challenge to the ROCKY MOUNTAIN FUR COMPANY that was characterized by his usual daring and resourceful campaign, but his efforts failed. The returns were lower than expected, and conflicts with the Indians (especially the Blackfeet) resulted in serious losses. The Rocky Mountain Fur Company was composed of some of the best trappers and traders in the history of the fur trade—the Sublette brothers, Thomas Fitzpatrick, and Jim Bridger—but these were men at home in the mountains and around the lodge fires, not in the counting house. Although they managed to hold Astor at bay, their triumph was a short one. Fashion was changing, and the fur business was in decline. In June 1834 Astor sold his fur business. It marked the close of an era in the American West.

Astor spent his remaining years in New York City. His astute investments in real estate—financed by profits from the fur trade—had made him the wealthiest man in America. More than any other individual, including WILLIAM HENRY ASHLEY, Astor turned the fur trade into a profitable business. In order to survive against the rival North West Company and the Hudson's Bay Company, he created a series of large companies. That he succeeded was testimony to his remarkable acumen in corporate organization and in shrewdly assessing the rise and decline of the fur business. He died at his home in New York City in 1848, leaving an estate in excess of \$40 million.

## Astoria

JOHN JACOB ASTOR had a vision of the fur trade as a worldwide business. With furs gathered in the northern reaches of North America's streams and mountains, ships would carry the harvest around the world. In 1800 China was an especially lucrative market. Astor's first step was the organization of the AMERICAN FUR COMPANY in 1808, but he needed a separate company to open the trade to the Pacific. To this end, in 1810 he organized the Pacific Fur Company. At a time when the fur trade also represented national interests, Astor's companies represented the United States, and they were arrayed against powerful rivals: the Canadian-based North West Company and the British-owned Hudson's Bay Company. Thus as relations with England became tenser in the decade after the Louisiana Purchase (leading to the WAR OF 1812), Astor and his fur-trading companies might be seen as representing American strategic interests. Nowhere was this confrontation more evident than in the Pacific Northwest. It was there that Astor hoped to build a post, thwart the North West Company and the Hudson's Bay Company, and establish trade with China.

The foundation of Astor's plan was information derived from the expedition of Meriwether Lewis and William Clark (1804–06). Lewis and Clark had traveled across some of the richest fur-bearing lands on the continent. Their experiences demonstrated that furs could be gathered and transported to the Pacific Coast and from there shipped to China. This could be done with less expense than shipping from the East Coast, as his rivals and he were currently doing. Astor gained additional knowledge from some Canadian friends in the North West Company who were also in competition with the Hudson's Bay Company.

To establish his post and put it into operation, Astor organized two separate parties, the first to travel to Oregon overland and the second by sea. To staff the companies, he hired the very best fur traders and explorers, most of them from the North West Company. The most important of these was Alexander McKay, who had been a member of Alexander Mackenzie's expedition to the Pacific Coast in 1793. Astor offered shares in his enterprise to McKay and other recruits from the North West Company and also signed on several veteran French-Canadian and American independent trappers. In 1810 the seagoing expedition left with 33 men on the brig *Tonquin* from New York City to sail around Cape Horn to the Oregon coast. These Astorians suffered from a tyrannical captain, who had little experience or sympathy for his cargo of fur trappers. After the vessel reached the mouth of the COLUMBIA RIVER in March 1811, the company immediately laid out the site of the future post and began construction. Within a few weeks, Captain Jonathan Thorn provoked the surrounding Indian peoples into an attack that destroyed the *Tonquin* and its crew.

The “overland Astorians” were slower but, in the end, more successful. Wilson Price Hunt’s party of 64 left St. Louis in April 1811 to cross the continent. It was a hard passage, with desertions, hostile Indians, and missed trails. The party eventually splintered into smaller groups, Hunt and his group reached the site of Astoria in February 1812, and they soon constructed the fort. Astor’s dream seemed on the verge of success; at this point, his investment was more than \$200,000.

Astor’s expensive gamble seemed to have succeeded, but then fate intervened in the form of war between the United States and Great Britain. Most of Astor’s employees were Canadian, and they did not support the United States in the conflict. In October 1813 Astor’s representative, Duncan McDougall, sold Astoria to the North West Company for \$58,000, a price that represented only a fraction of Astor’s investment in the enterprise. Within a month a British warship appeared at the mouth of the Columbia, and on December 12, 1813, its captain took possession of the fort and renamed it Fort George, in honor of the British monarch.

In October 1814 the TREATY OF GHENT ended the war between the United States and Great Britain. The terms of the treaty specified that property should be restored to a condition that had existed before the declaration of war. The trading post of Astoria had been sold, not seized, but Astor sued to recover the post on the grounds that the sale had been forced and made for only a fraction of his original investment. The international tribunal agreed.

Astor again had his post on the Pacific, but the fur trade was changing. Twenty-five years of war had impoverished much of Europe, especially the rich merchants and nobility who were the buyers for American furs. Astoria as the center of the fur trade in the Pacific Northwest had already been replaced by FORT VANCOUVER, the headquarters of the Hudson’s Bay Company operations. In 1821 Astoria was absorbed into the Hudson’s Bay Company.

In its brief history, Astoria was an important strategic location for the fur trade and a symbol of the American presence in the region. At a time when the young American nation could mount only a single expedition of exploration, an American entrepreneur, John Jacob Astor, built a trading post that flew the American flag and proclaimed America’s presence. The significance was the greater because Astoria was located at the mouth of the Columbia River, already seen as the great inland waterway of the West Coast.

### **Atkinson, Henry** (1782–1842) *U.S. Army officer*

Henry Atkinson was a professional soldier who spent much of his career on the frontier of the trans-Mississippi West. Born in North Carolina in 1782, he entered the army as a captain of the Third Infantry Regiment in 1808 and was promoted to colonel of the Sixth Infantry Regiment in May 1815. With the close of the WAR OF 1812, the American government determined to make its influence felt among the Indian nations of the trans-Mississippi West, some of whom were heretofore allied with the British. To this end, Secretary of War JOHN C. CALHOUN organized an expedition to the mouth of the Yellowstone River. Calhoun named Atkinson to command the expedition, which would include an army of 1,000 men. The main force never traveled past Council Bluffs, but in summer 1820 Atkinson dispatched parties of exploration under Major Stephen H. Long and Captain Matthew M. Magee to the foothills of the Rocky Mountains (Pike’s Peak) and to the mouth of the Minnesota River. That same summer, Atkinson was promoted to brigadier general and transferred to St. Louis, where he assumed command of the western department.

In 1824 Atkinson was given command of a second expedition to the Yellowstone River, and with 476 soldiers he left Council Bluffs on the voyage north on May 16, 1825. The group successfully reached its objective, and Atkinson opened negotiations with several Indian groups along the way. These treaties inaugurated relations between the U.S. government and several of the most important tribal groups in the interior of the continent. While on the headwaters of the Missouri River, Atkinson met WILLIAM HENRY ASHLEY returning to St. Louis with furs and escorted him downriver. In autumn 1825 Atkinson returned to St. Louis and chose the site of Jefferson Barracks nearby. Two years later, he authorized the expedition of Colonel Henry Leavenworth that established FORT LEAVENWORTH in what would become eastern Kansas.

When the BLACK HAWK WAR broke out in 1832, Atkinson was in command of the U.S. force. He supervised the pursuit of the Black Hawk and his band, culminating in the Battle at Bad Axe in August 1832, when the Sauk peoples were virtually destroyed. In 1840 Atkinson directed the removal of the Winnebago people from Wisconsin to Iowa. Fort Atkinson, established that year, was a tribute to his long service on the frontier.

Atkinson died June 14, 1842, at Jefferson Barracks with the rank of brigadier general.

**Audubon, John James** (1785–1851) *naturalist, artist*

One of America's best-known naturalists, John James Audubon is remembered principally for his bird paintings. He was born in Santo Domingo (Haiti) in 1785, the illegitimate son of Jean Audubon, a French ship captain, and Jeanne Rabin, a French domestic servant who died soon after his birth. Audubon grew up in France, where he was adopted by his biological father and his wife, Anne Moynet Audubon. As the son of a wealthy member of the bourgeoisie, Audubon studied serious academic subjects as well as music and fencing. For the most part, however, he was an indifferent student. The one subject that interested him was art—especially the depiction of natural subjects in the scientific spirit of Théodore Rousseau, George-Louis Leclerc de Buffon, and Jean-Baptiste Lamarck. He also claimed to have studied with the famous painter Jacques-Louis David, but the authenticity of this assertion is open to question. From an early age, he was interested in painting and cataloging wildlife. By the age of 15 he had created a considerable collection of drawings of French birds.

Audubon served as a naval cadet at Rochefort-sur-Mer from 1796 to 1800. After his time in the French military, he immigrated to the United States in 1803 to manage Mill Grove, an estate in Norristown, Pennsylvania, owned by his father. There he lived as a well-to-do planter, hunting and exploring his natural surroundings. Intrigued by the behavior of the local birds, he became the first person in America to conduct a “banding” experiment, tying threads to the legs of young peewees and observing their return the following year to a spot near their birthplace.

In 1808 he married Lucy Bakewell, the daughter of a neighbor. The couple subsequently moved to Louisville, Kentucky, where Audubon had established a general store with his business partner, Ferdinand Rozier. He was drawn to Louisville because of the frontier town's commercial potential and its closeness to the wildlife he wished to paint. As a recently settled part of the young nation, Kentucky was much closer to wilderness than Pennsylvania, providing Audubon with fresh ideas and numerous new birds to paint. While in Louisville, he met the Scottish ornithologist Alexander Wilson, who had come to the area to paint birds. Realizing that his own artistic efforts were superior to Wilson's, Audubon began to consider developing his hobby into a career.

In the meantime, he and Rozier continued to seek financial gain by relocating farther down the Ohio River to Henderson, Kentucky, in 1810. Their first years in Henderson were prosperous, and Audubon continued to paint new bird species he encountered on his business travels. By 1818, however, he was in debt after several businesses failed. He was forced to sell his family's belongings, and

John James Audubon (Hulton/Archive)

the Audubons moved back to Louisville, where he was jailed for a short time for failure to pay debts. He was finally bankrupted by the PANIC OF 1819. During this low period, two of the Audubons' children died in infancy. The family then moved across the Ohio River to Cincinnati, where he found work as a taxidermist at the new Western Museum. He also painted portraits and gave lessons in painting.

By 1820 Audubon had determined to end his business career and set out to publish his bird paintings. He and his assistant, Joseph Mason, embarked on an expedition to catalog and depict the birds of North America. The two men traveled down the Ohio and Mississippi Rivers, through Louisiana, and around the Great Lakes region, attempting to document all the birds in the United States east of the Mississippi River. Audubon created paintings of all the birds they found; in the background, Mason illustrated the plants and landscapes in which the birds lived. Audubon planned to publish his paintings in a comprehensive collection.

Audubon attempted to publish his work in the United States, but encountered scorn and opposition from the influential ornithologist Wilson. He subsequently joined

his wife and children in Louisiana, where Lucy Audubon was working as a governess and teacher to support the family. After several years of helping his wife by teaching drawing and music to her students, he used the family savings to travel to Great Britain in 1826, where he hoped to generate interest for his project. Unlike the cold response he received in New York and Philadelphia, Audubon and his ideas were greeted with great enthusiasm in Liverpool and Edinburgh, where he was elected to the Royal Society. He began to sell subscriptions to raise money for his publication, upon which he traveled to London, where he eventually secured the support of a crucial subscriber: the king. With this support, he was able to publish *The Birds of America* incrementally over the next 11 years (1827–38). The massive collection contained 435 hand-colored aquatint engravings depicting 1,065 different birds, all in life size. To pay for this extravagant book, Audubon continued to sell subscriptions to wealthy patrons for about \$1,000 each. He also returned to America to find more birds and generate more subscriptions. Later he wrote the five-volume *The Ornithological Biography* (1831–39) to complement the color plates; and a catalog of the birds, *Synopsis of Birds of North America* (1839).

His reputation established, Audubon returned to the United States in 1839. He purchased an estate on the Hudson River, which he named Minnie's Land. He also began working on *The Viviparous Quadrupeds of North America*, in which he planned to document mammals in the same manner that he did birds. Various sections of his work were published incrementally between 1842 and 1854 and included 150 hand-colored lithographs. By the late 1840s, Audubon was becoming senile. Thus, his son, John Woodhouse Audubon, painted or completed roughly half of the illustrations in *Viviparous Quadrupeds*.

John James Audubon envisioned his subjects romantically, showing the beauty and grace he saw in the natural world. He created anthropomorphic compositions that showed birds and animals as heroic Americans. Despite this tendency to idealize his subjects (and to place them in anatomically unrealistic poses), his paintings are closely observed and remain scientifically and historically significant. His works also provide important documentation of the American landscape that was altering quickly during his lifetime. Audubon died on January 27, 1851, at his Hudson River home.

### **Austin, Moses** (1761–1821) *businessman*

An important figure in the early American lead industry and later a pioneer American entrepreneur in the settlement of TEXAS, Moses Austin was born in Durham, Connecticut. Orphaned at 15, he worked in the family dry goods business in Middletown, Connecticut, and later in Philadelphia, Pennsylvania. Eventually, he moved his general merchandising business to Richmond, Virginia, where he became interested in lead mining and processing. In 1789 he gained control of Virginia's richest lead deposits, and three years later he imported experienced lead miners and smelter workers from England. In so doing, he established the American lead industry, but his expanded ambition led him to look west.

In 1797 Austin moved to Missouri, then in Spanish upper Louisiana, where he acquired the rights to a rich lead deposit. There, near present-day Potosi, he established what was perhaps the first Anglo-American settlement west of the Mississippi River in what was to become Missouri. Near Potosi, he opened LEAD MINES and soon built smelting furnaces. Austin brought with him the advanced techniques that he had put into place in Virginia, and his Missouri lead enterprise soon prospered. With the most efficient smelting furnaces, he soon outdistanced his competitors, gradually taking control of the lead mining and smelting in the region. His techniques were to become standard in the lead industry for the next two generations, changing only after the Civil War. He also established a town at Herculaneum as a point from which to ship his lead product downriver.

Although Austin made a substantial fortune, his economic prospects, like so many others at the time, fell victim to the changing international situation. After Thomas Jefferson's purchase of the Louisiana Territory in 1803, Missouri was a part of the new, enlarged United States, and Austin was once more a citizen of the republic. As Jefferson and his successor, James Madison, attempted to deal with worsening relations with Great Britain, they tried a variety of strategies, including an embargo and on-intercourse acts forbidding trade with European belligerents. None of these would work, and finally Madison sent a declaration of war to Congress in spring 1812. The prolonged controversy of the previous decade had severely disrupted those portions of the American economy concerned with trade and exports. Austin's lead-mining enterprises suffered, and his substantial fortune disappeared. His economic prospects continued to decline with the depression that followed the end of the war. In 1816 Austin left Potosi and his lead mines to the management of his son, STEPHEN F. AUSTIN. By this time, he had become a prominent citizen of the territory. To bring relief to his economic difficulties and the hardships of others,

he helped to establish a bank in St. Louis. The enlarged money supply would have assisted all debtors. Unfortunately, the bank fell victim to the economic crunch associated with the PANIC OF 1819. Austin was now on the edge of bankruptcy.

It was at this point, in 1819, that he developed a plan to settle an American colony in what was then Spanish Texas. He was spurred in this direction by the economic crisis of 1819, whose baneful results had created a substantial pool of willing immigrants; and also by the recent ADAMS-ONÍS TREATY, which laid out the boundaries of the Louisiana Purchase. In 1820, Austin traveled to San Antonio de Bexar to make the case for his colony to Spanish officials. His argument was that he was a former subject of the Spanish king (in Spanish Louisiana before 1803), that he proposed to swear loyalty again to the monarch, and that in exchange for a substantial grant of land he would provide a large number of settler families who would also become Spanish subjects.

The Spanish governor refused his request, but Austin was persistent. Working through influential friends, he eventually convinced the governor to accept the plan. In March 1821 officials notified Austin that he had received a land grant of some 200,000 acres, which he could settle with 300 families in accordance with the conditions that he had proposed. Austin would choose the families and serve as the intermediary between his colony and government officials. In exchange for a generous grant of land, the immigrants would swear allegiance to the Spanish Crown and become Catholic. Austin returned to St. Louis and was preparing to carry out the provisions of his grant when he became ill from the effects of his trip and died. He left the responsibilities of the colonization scheme to his son, Stephen Austin.

**Austin, Stephen F.** (1793–1836) *diplomat, settler*

The most important figure in the American colonization of Spanish and later Mexican Texas, Stephen Fuller Austin was the son of MOSES AUSTIN. Born in Virginia, Austin attended Yale College and Transylvania University. His formal schooling ended, he moved to Missouri, assisting his father in lead mining and in the mercantile business in Potosi. The younger Austin was a public figure of some importance in the early history of the territory, serving as a militia officer and a member of the Missouri Territorial Legislature from 1814 to 1820. With the decline of the family fortunes in Missouri, Stephen Austin moved to Arkansas Territory in 1820, where he accepted

an appointment as judge in the first circuit court. He left before assuming the judgeship, however, traveling downriver to New Orleans, where he read law and worked on a newspaper. In 1821, when Austin was 27 years old, his father died. He returned to Missouri and prepared to carry out the TEXAS colonization project that Moses Austin had begun. Although he was originally skeptical of his father's plans to colonize Texas, Stephen Austin eventually became a wholehearted convert and entered into the arrangement with enthusiasm and great intelligence.

In implementing his father's plans, Austin was to exhibit extraordinary qualities of tact and patience in the face of continually changing circumstances. He visited Texas in 1821, confirmed the arrangement to settle 300 families, and selected the Brazos and Colorado River valleys as the site of his colony. His colonists arrived at the site in late 1821, but in the meantime Mexico had established its independence from Spain. As the holder of a Spanish land grant, Austin became the object of suspicion for his loyalty to the Spanish colonial government. In the face of these mounting difficulties, he journeyed to the capital, Mexico City, to make his case to the government of the new, independent Mexican nation. Austin had to wait a year for his colonization plan to be confirmed, but he was a patient man who used the time wisely in the study of language and history of his new country. He also made numerous influential friends in the new government.

Austin returned to his colony in Texas with great authority. In an attempt to establish order in its distant north, the Mexican government had made him chief executive, judge, and military commander. Perhaps most significant, he had absolute authority in granting land to settlers. By 1825 Austin had met the terms of his original grant, settling some 300 families on his huge tract. The passage of a general colonization law spelled out the terms under which Austin had acted. This system, reflecting the original Austin colony, named agents of the government, known as *empresarios*, to contract for the introduction of families into Texas. The empresarios were responsible for selecting the families, granting lands, and maintaining order. Settler families chosen were entitled to as much as a league of land (4,428 acres) under generous terms. In exchange for these responsibilities, empresarios received large land grants from the government and great authority over the immigrants. Several individuals contracted with the Mexican government under this system, but Austin was the most prominent in both influence and numbers. Under the law, Austin contracted in 1825, 1827, and 1828 to bring in 900 families; he succeeded in settling more than 750. The scale of his work was astonishing, and his influence was in like proportion. As land grantee and governor, Austin distributed—and settled innumerable disputes over—land titles. Increasingly, he also

mediated relations between Mexican officials in Texas and the Anglo-American settlers. The terms of the land grants specified that the settler families should become Roman Catholic and citizens of Mexico. In reality, the American settlers paid little attention to such provisions.

During the first decade of the colonization of Texas, Austin labored tirelessly on behalf of the Mexican government, to whom he gave complete and unqualified allegiance, and on behalf of his colony and its settler families. Among the many items to which he gave his attention were the land system, mapping the state of Texas, pacification of the Indians, and the growing commercial functions of the American colony. He supervised the construction and operation of cotton gins and saw mills and also promoted the construction of public schools. Throughout his work on all these projects, he maintained great influence with the government in Mexico City. Indeed, he persuaded the government to permit the continued introduction of slaves into the Texas colony at a time when the government of Mexico was committed to the abolition of slavery in the nation at large.

The very success of the colonization system generally and Austin's colony in particular aroused growing concerns on the part of both the colonists and the Mexican officials. By 1830 the newly arrived American colonists in Texas had become increasingly numerous. These Americans were predominantly Protestant and indifferent or even hostile to the government of Mexico and its officials. When a new Mexican law in 1830 forbade the immigration of Americans into Texas, Austin worked for its repeal. At the same time, his role as arbiter between the growing tide of American settlers and the Mexican officials in the state of Coahuila-Texas and Mexico City was becoming increasingly more difficult. The Americans were impatient with Mexican authorities and their insistence on observance of local and national laws. Mexican officials thought of American Texans as disrespectful of Mexican authority and indifferent to the conditions under which they had been granted their lands. In the midst of these divergent views, Austin advised patience and tolerance in permitting Mexican officials to work out relations with the Texas colonists. Austin's neutrality extended to Mexico itself, where, in spite of his influence, he never entered into the many national political contests. Instead, he continued to argue that the interests of Texas and Texans were best served in the long run by their continuing loyalty as citizens of Mexico.

However, events in Mexico City that Austin could not control made his counsel moot. In 1832 General ANTONIO LÓPEZ DE SANTA ANNA seized power in Mexico, and his authority was soon absolute. Declaring that democracy was not appropriate for the nation of Mexico, Santa Anna abolished the federal constitution of 1824. Texans began to organize in defense of what they saw as their rights. A

convention called in 1833 petitioned the federal government of Mexico for a separation of the states of Coahuila and Texas and the establishment of a separate state government in Texas. It also urged a series of judicial reforms to make the legal system more responsible to the needs of Texas settlers. As the most influential Texan and a known Mexican loyalist, the convention chose Austin to carry the petitions to Mexico City and plead for their acceptance. Austin himself thought the reforms appropriate, that the separation of Texas was the only way to prevent a separatist movement. But he suspected that the conventions and the petitions would be seen in Mexico City as little short of treason. He was soon proved right. Many officials in Mexico had long viewed the establishment of a separate state of Texas as a prelude to a revolution for independence on the part of Texans. In the political confusion of Mexico City, Austin and his arguments were seen as the essence of disloyalty. Mexican officials charged Austin with organizing a rebellion in Texas and imprisoned him. He was incarcerated for a year and then under house arrest for another six months. As Santa Anna moved to consolidate his power and bring Mexico under his authority, Austin—the one figure who might have found a compromise—was under arrest in Mexico City. Never brought to trial, he was finally released in July 1835 under a general amnesty law.

Austin returned to find Texas in revolt. Santa Anna's attempts to unite all of Mexico (including Texas) under his authority by force had generated grave apprehension. In spite of his imprisonment, Austin remained opposed to Texas independence. He thought Texans were not strong enough to establish independence, and he thought the interests of Texas were best served by a political alliance with Santa Anna's opponents in Mexico City. But before Austin could organize a convention to draft a response to the crisis, he was overtaken by a series of events beyond his control. Armed clashes between Texan military groups and elements of the Mexican army made his efforts at compromise no longer credible. As Texans struggled to organize a military resistance to what they regarded as an invasion of their homeland, military leaders such as SAM HOUSTON came to prominence as civil leaders like Austin faded in influence.

In the aftermath of military disasters at THE ALAMO, Austin was briefly head of the new revolutionary government of Texas and commander of its armed forces. Acceding to the argument that he was the Texan best known to the American people, he undertook a diplomatic mission to the United States. He served in this capacity from 1835 to 1836, while Houston became commander of the Texas army. Although Austin was warmly received by the American people, the government of ANDREW JACKSON attempted to maintain a neutral stance regarding the conflict in Texas. Accordingly, Jackson was cool to the idea of annexation.

After Houston's decisive victory at San Jacinto assured Texan independence, Austin returned to Texas. Although he had been the most influential and significant Texan over the previous 15 years, he lost decisively in September 1836 to Houston in the contest for president of the Republic of Texas. Houston's decisive triumph confirmed the preference of citizens for the military in the aftermath of a successful revolution. Austin accepted Houston's offer to serve in the new government, and he was appointed secretary of state for the new republic. He died in December 1836 at the age of 43. He never married and was survived by his sister and her children.

Austin was slight of stature and never robust. His health was seriously damaged by his 18 months (six in solitary confinement) in a jail in Mexico City. It is one of the ironies of that period in Texas and Mexican history that he had gone to Mexico City in search of a compromise that would keep Texas a part of the Republic of Mexico. His physical condition continued to deteriorate under the stresses of trying to influence a society on the edge of a revolution for independence, and later, as a diplomat dispatched to the United States.

Although Austin did not prove successful in taking control of a revolution that demanded military leaders, he was

ideally suited to the role of colonizer that he practiced so successfully for 15 years. He was an excellent manager, whether in his father's store in Potosi or in planning the settlement of the hundreds of families who would settle on his grants. His early sojourn in Mexico City gave him an understanding of language and culture that no other Texans could match. Having accepted the land and trust of the Republic of Mexico, he was intensely loyal to that country, and he worked tirelessly in search of compromises that would keep Texas a part of the republic. Austin's very success proved, in the end, his undoing. His Texan colonies (in addition to the hundreds of families brought in by other empresarios) created a presence that looked north to the United States rather than south to Mexico City. Few leaders on the American frontier made such an impact; and it is for this reason that Stephen F. Austin is considered the Father of Texas, at least the independent Republic of Texas and, later, the state of Texas, after its annexation by a U.S. joint resolution in 1845.

**Further reading:** Eugene C. Barker, *The Life of Stephen F. Austin, Founder of Texas, 1793–1836* (Austin: University of Texas Press, 1929); Gregg Cantrell, *Stephen F. Austin, Empresario of Texas* (New Haven, Conn.: Yale University Press, 1999).

### **Baltimore, Battle of** (September 12–14, 1814)

As a result of this battle in the WAR OF 1812 (1812–15), the British were driven back during their offensive in the Chesapeake Bay region. After they had burned Washington, D.C., the British turned their attention to the northern Chesapeake Bay and the seaport of Baltimore. This city had commissioned many privateers that wreaked havoc on British commerce. Baltimore was also the seedbed of strong Anglophobia and thus domestic support for the war. On the morning of September 12, British general Robert Ross landed 4,500 troops at North Point, about 14 miles from the city. As they proceeded to Baltimore, they were met by 3,200 American militia led by General John Stricker. Although they forced the Americans to retreat, the British suffered heavy casualties, and an American sharpshooter killed Ross. The next day, demoralized by the loss of their commanding officer and confronted by even more American troops dug in just outside of Baltimore, the British decided to halt their assault by land.

At the same time, Admiral Sir Alexander Cochrane conducted an unsuccessful naval approach up the Patapsco River. Cochrane had hoped to capture Fort McHenry, defended by 1,000 Americans, and thus support the British land attack. Cochrane used bomb-and-rocket ships to fire more than 1,500 rounds at the fort on September 13 and 14. This spectacular bombardment did little serious damage, killing only four and wounding 24 Americans. An attempt to send 1,200 men in barges to force their way up the river to Baltimore was driven back by American fire from the shore. The British withdrew and left the Chesapeake area. As they did so, they liberated more than 2,000 runaway slaves, most of whom subsequently settled in British Maritime Canada.

The inability to capture Baltimore, after their great success in sacking the nation's capital, reflected the difficulty the British had in invading any population center. Despite their superior training and firepower and their ability to capture territory, the 10,000–15,000

American militia in Baltimore provided too strong a defense.

The Battle of Baltimore is also noteworthy as the inspiration for FRANCIS SCOTT KEY's "Star Spangled Banner." Key had boarded a British ship to negotiate the release of a prisoner of war. Although he was successful in this effort, the British did not allow him to return to the American lines until after the bombardment of Fort McHenry. Key thus watched the "rockets' red glare" and the "bombs bursting in air" throughout the night of September 13 and 14. In the morning, despite the tremendous uproar and incredible fireworks, and with the American flag somewhat tattered, Fort McHenry remained in American hands. Inspired by this sight, Key penned the words, which he put to the MUSIC of an 18th-century drinking tune. The song became popular instantly, and Congress made it the national anthem in 1931.

### **Baltimore & Ohio Railroad**

Chartered by Maryland in 1827, the Baltimore & Ohio Railroad (B&O) was the first railway projected westward over the Allegheny Mountains to the Ohio Valley. The businessmen of Baltimore were worried about the increased western trade that New York City was gaining from the ERIE CANAL. They feared that the NATIONAL ROAD could not successfully compete with either the Erie or a proposed canal system planned by Pennsylvania. The Baltimore leaders soon decided that a railroad to the West was the answer to the commercial competition from the North. Of the \$3 million of capital stock issued by the company under the charter, the state of Maryland took \$1 million and the city of Baltimore \$500,000, while the remainder was made available to individuals and corporations. The company was

organized in April 1827, and a merchant banker from Baltimore, Philip E. Thomas, was elected president. Surveying parties were sent out to seek a route to the Potomac, and the first stone for the new railroad was laid on July 4, 1828.

The first track was laid in the English standard gauge of 4 feet, 8 1/2 inches in October 1829; in May 1830 daily passenger service was started from Baltimore to Ellicotts Mills, 13 miles west of Baltimore. Horses pulled the first trains on the B&O even though some experts thought steam locomotion was practical. A small experimental steam engine, the Tom Thumb, built by Peter Cooper, convinced the B&O directors that steam power was possible; in 1831 they ordered steam locomotives for their road. B&O officials soon learned that such locomotives could pull moderate loads up a 2-percent inclined plane, an important ability considering the mountainous terrain of western Maryland and Virginia. In fact, the multitude of engineering problems faced and solved by B&O officials was so great that D. Kimball Minor, the editor of *American Railroad Journal*, described the Baltimore & Ohio as the Railroad University of the United States.

The B&O reached Frederick, 61 miles west of Baltimore, late in 1831 and Harpers Ferry in 1837. A 32-mile branch to Washington, D.C., was opened in 1835. By 1836, the revenue on the 84-mile Main Stem to Harpers Ferry was \$281,000, more than 40 percent of which came from passenger service.

Under the presidency of Louis McLane (1836–48) much of the original line of the B&O was upgraded, and the line was pushed westward to Cumberland. Late in 1842, the line to Cumberland, the eastern terminal of the National Road 128 miles west of Baltimore, was opened to service. Important coal mines were located in the Cumberland area, and by 1848 coal moving to Baltimore made up 40 percent of eastbound tonnage. Thomas Swann, who succeeded McLane as president from 1848 to 1853, financed the building of the B&O over the mountains of Western Virginia to Wheeling by obtaining new stock subscriptions and selling bonds in England. The last rails of the new line to Wheeling were laid on December 24, 1852. Between 1851 and 1857, a second route to the Ohio River (the B&O-controlled Northwestern Virginia Railroad) was built. The 104-mile road ran from Grafton, 100 miles west of Cumberland, to Parkersburg, 90 miles downstream from Wheeling. By 1860 B&O revenue on the 379-mile main stem from Baltimore to Wheeling amounted to \$4 million. The economic importance of the growing B&O was reflected in the population of the city of Baltimore, which climbed from 80,000 in 1830 to 212,000 in 1860.

John W. Garrett, a Baltimore commission merchant and banker, became the B&O president in 1858, a position he would hold until his death in 1884. He was a champion

of the individual shareholder and successfully pushed for more frequent dividends on the common stock. He also ran the company during the crisis of the Civil War, which came early to the Baltimore & Ohio when John Brown stopped a B&O passenger train during his raid on the U.S. arsenal at Harpers Ferry in October 1859. Because of its location in a border state, the B&O was destined to experience far more than its share of the violence and destruction in the Civil War. Early in the conflict Garrett spoke of the line as a “southern” railroad, but the increasing destruction of B&O property by Colonel Thomas J. (Stonewall) Jackson led him to speak of Confederates as “rebels.” Because of the destruction, portions of the B&O in the mountains of Virginia could not be fully restored for weeks and months at a time. In early autumn 1863 Garrett played a major role in helping to direct the rail movement of 25,000 Union troops from Washington, D.C., via the B&O and other lines in Ohio, Indiana, Kentucky, and Tennessee, to the aid of General Rosencrans near Chattanooga. Throughout the war, the Baltimore & Ohio line to Washington, D.C., was the only rail connection to the nation’s capital. Despite the destruction it suffered, the B&O prospered during the war years. By 1865 annual revenue on the main stem was up to \$10 million.

In the years after Civil War, John Garrett greatly expanded his railroad. In the late 1860s he started to build two giant wrought-iron bridges across the Ohio River. Between 1868 and 1873 he built the metropolitan branch northwest of Washington and linked it with the main stem near Point of Rocks. In the early 1880s Garrett began to build a line into Philadelphia.

The B&O, which was operating only 520 miles of line in 1865, had grown to a rail network of 1,700 miles by 1884. Most of the expansion had been paid for with borrowed money rather than new share capital. During the postwar years, Garrett’s railroad had engaged in several rate wars with the Pennsylvania, the New York Central, and the Erie, with the final result being a general lowering of freight rates. During the late 1880s and early 1890s, operating expenses on the B&O climbed faster than the total revenue. On March 1, 1896, the Baltimore & Ohio was placed in the hands of receivers.

### banking and currency

As institutions that safeguard, lend, invest, and exchange money, banks have been vital to economic growth since

the earliest days of the United States. With the economy expanding vigorously in the early 19th century, issues related to the country's banking and currency, or the medium of exchange, were hotly debated. For 50 years from 1791 to 1841, the focus of the debate was the Bank of the United States, a federally created central bank that housed the federal government's revenues and acted as its fiscal agent. The Bank of the United States was established twice, the first time in 1791, over opposition from Thomas Jefferson, who claimed that the Constitution did not grant Congress the authority to create a bank. Shortly afterward, in 1792, a national currency was established, using the decimal system of coinage, with the dollar as the national monetary unit. A mint to produce currency was established in 1794.

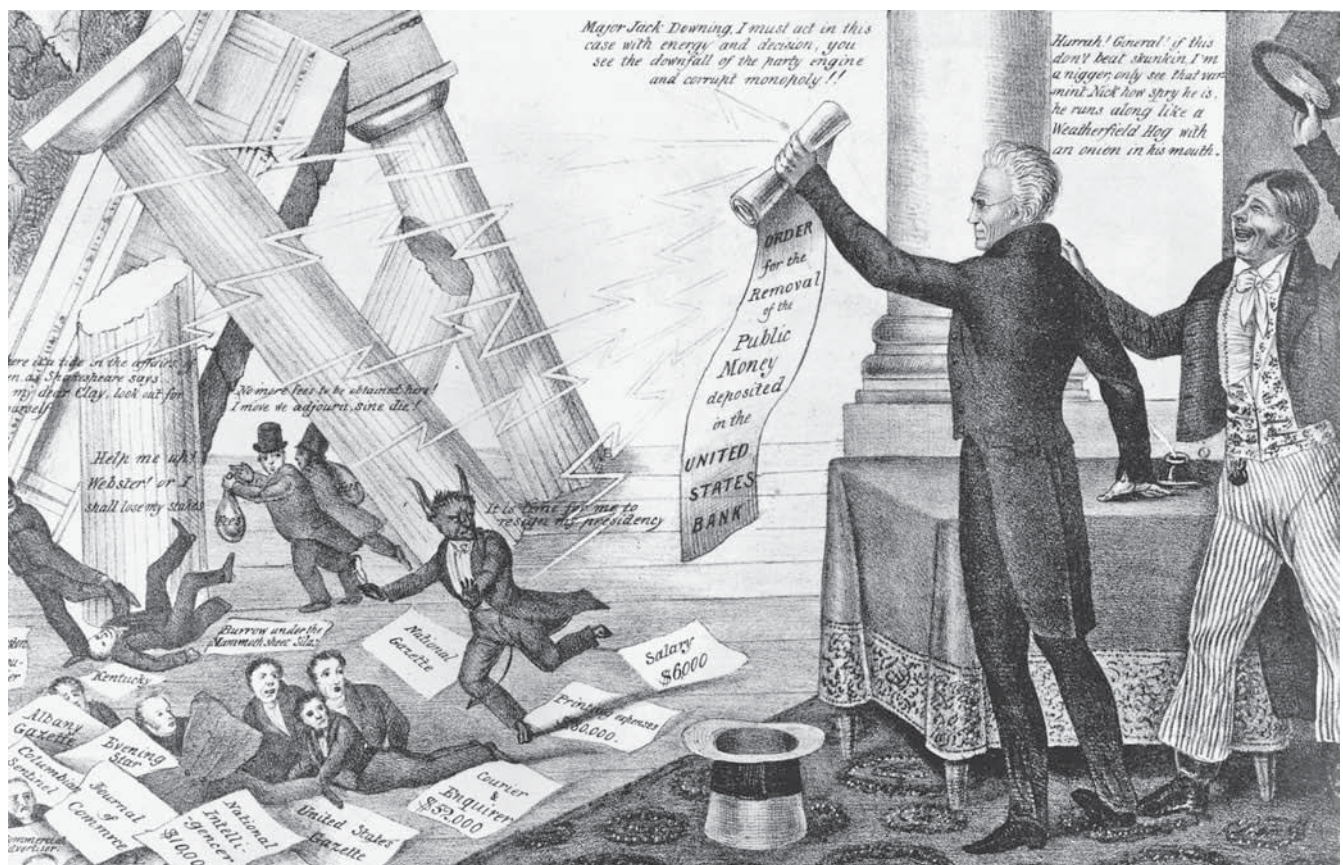

With eight branches in major cities, the first Bank of the United States issued banknotes exchangeable for gold as legal tender and operated a commercial business, making loans to state-chartered banks (known as state banks) and to the public at large. State banks issued their own paper money, but the central bank exerted a conserva-

tive influence by refusing to accept state banknotes not redeemable in specie, or gold and silver actually possessed in their vaults.

State banks varied considerably in their structure throughout the antebellum period. Some were state monopolies, with the state as principal stockholder and all other banks prohibited. In other states, competing, privately owned banks were permitted, while in still others, no banks were allowed.

In any case, the Bank of the United States was opposed by state bankers, who chafed at the restrictions on their activity, and by those who followed Jefferson in favoring agrarian interests over mercantile interests. Because of the heavy political opposition, the bank's 20-year charter went unrenewed in 1811, and the first Bank of the United States went out of existence.

Events soon prompted Congress to reconsider. During the WAR OF 1812, the lack of a central bank made it difficult for the federal government to finance the war. Financial chaos spread as 120 new banks were chartered in the wake of the first bank's demise, often with little regulation

In this cartoon, President Andrew Jackson refuses to renew the charter of the Bank of the United States. Pandemonium ensues amid "The Downfall of Mother Bank." (Hulton/Archive)

and a tendency to extend credit out of proportion with their reserves. Many of these banks failed. In 1816 Congress granted a 20-year charter for a SECOND BANK OF THE UNITED STATES, this one even larger, with \$35 million in capital stock and, eventually, 25 branches. Its constitutionality was affirmed in *MCCULLOCH V. MARYLAND* (1819), in which the Supreme Court decided that the federal government was permitted to operate a national bank exempt from state regulation.

The Second Bank of the United States had a rocky start. Its first president, William Jones, encouraged over-speculation by state banks and nearly ruined the institution. The second president, Langdon Cheves, appointed in 1819, rescued the bank by calling in loans and foreclosing mortgages, but many state banks were too overextended to pay their debts, and hundreds of businesses closed down, ruining investors. The result was the PANIC OF 1819, a depression that sent prices tumbling and unemployment soaring, and left widespread enmity against the bank as a ruthless institution answerable to no one.

In 1823 Nicholas Biddle became president of the second bank. Under his management, the bank prospered and the nation's currency was stabilized, counteracting the inflationary tendencies of the era and earning a degree of public approval. To get around congressional restrictions on the bank's printing of small-denomination notes, Biddle created branch drafts, bank-issued checks payable to the bearer that served as a uniform, stable form of money.

While many Americans supported the second bank, others opposed it, especially state bankers, thwarted credit-seekers, and small farmers who argued that it served the exclusive interests of wealthy businessmen in the East. The champion of the antibank movement was ANDREW JACKSON, a self-made backwoodsman and war hero who claimed to defend the small farmers of the South and West against the eastern moneyed elite. The first candidate of the emerging Democratic Party, Jackson narrowly lost the election of 1824 but won in 1828, setting the stage for a struggle with Congress over the Second Bank of the United States.

With the encouragement of Senator HENRY CLAY, Biddle applied to renew the bank's charter four years early, in 1832, and both houses of Congress passed a bill to do so. But in July 1832 President Jackson vetoed the bill, arguing that some of the bank's powers and privileges were "unauthorized by the Constitution, subversive of the rights of the States, and dangerous to the liberties of the people." He even charged that the bank had interfered in the electoral process by using bank funds to try to defeat him in the 1828 election. Jackson's veto set off what became known as the Bank War.

Reelected in 1832, Jackson took his electoral victory as a mandate to destroy the bank, which he called "this

hydra of corruption." In 1833 he and the bank's supporters waged war against each other with all the legal means at their disposal. Jackson ordered Secretary of the Treasury William Duane to withdraw federal funds from the bank. When Duane refused, Jackson fired him and replaced him with Roger B. Taney, who removed the funds as ordered and distributed them among selected state banks known as "pet banks." In 1834 the Senate fought back by adopting two resolutions to censure Jackson and rejecting Taney's permanent appointment to the Cabinet. Jackson formally protested the censures, which were removed from the Senate record in 1837. Bank president Biddle restricted credit and called in state bank loans. With public opinion supporting Jackson, Biddle was pressured into restoring the credit and loans.

In 1836 the second bank's charter was not renewed, but Biddle obtained a state charter from Pennsylvania, and the bank became known as the Bank of the United States of Pennsylvania. The reconstructed institution didn't last long. With the bank's finances rocked by the PANIC OF 1837, Biddle resigned as its president in 1839, and the bank's doors closed in 1841.

The panic of 1837 was a worldwide depression, but its particular force in the United States could be traced to the Bank War and to Jackson's policy of transferring federal funds to the pet banks. Thanks to income from tariffs and the sale of western public lands, Jackson succeeded in paying off the national debt, but this economic good news was short-lived. The surplus of government funds was deposited in the pet banks, which, unhampered by federal oversight, used the monies for risky speculation. In an era of economic expansion, there was no shortage of ventures craving capital, including land deals, industrial projects, and canal and railroad construction. The pet banks over-extended credit to these ventures by issuing banknotes that greatly exceeded their specie reserves. Following their example, wildcat banks, so called for their financial recklessness, did the same, particularly in the West. State banks freely printed paper money, until there were hundreds of different kinds of notes in circulation. The ratio of paper notes to gold or silver reached 12 to 1.

Under these conditions, inflation mushroomed, as prices climbed to keep up with the perceived low value of the money in circulation. Interest rates rose, as the Bank of England, suspicious of the stability of the U.S. boom, raised the interest rates it charged to American borrowers. Since the U.S. government accepted paper money for sales of western land, speculators eagerly bought up vast tracts, leaving the government with banknotes of questionable value while the speculators made exorbitant profits by reselling the land to settlers.

In 1836, alarmed at the growing chaos, Jackson issued the Specie Circular, which decreed that henceforth only

gold and silver coin would be accepted for the purchase of public lands. The presidential order brought a halt to the speculation, but it also led to the collapse of the pet banks. Taking the Specie Circular as a vote of nonconfidence in paper money, investors rushed in panic to their banks to demand that their banknotes be exchanged for gold and silver. The banks lacked enough specie reserve to pay all the debts, so they called in loans that borrowers could not repay. Banks closed, businesses failed, investors were ruined, production ground to a halt, and many people were thrown out of work. The ensuing depression lasted for seven years.

In the midst of the economic calamity, newly elected president MARTIN VAN BUREN, handpicked by Jackson as his successor, tried to prevent a recurrence of the damage done by Jackson's policy of placing federal funds in pet banks. In 1837 he proposed that federal funds be placed in an independent treasury, or subtreasury, separate from all banks. The proposal met with much congressional opposition and failed to pass in three successive sessions. Congress finally enacted it in 1840, founding the Independent Treasury System. By that time, Van Buren's political support was so low that he was easily defeated in the 1840 election by WILLIAM HENRY HARRISON, the candidate of the WHIG PARTY that had formed in the 1830s to oppose Jackson.

In 1841, before the Independent Treasury act could be completely carried out, congressional Whigs repealed it, hoping to establish a new central bank with Harrison's support. But Harrison died only one month after taking office, and his successor, JOHN TYLER, a former Jacksonian Democrat, alienated the Whigs by vetoing the bills that would have restored the Bank of the United States. In 1844, the Democrats won back the presidency, and in 1846 the Independent Treasury System was resurrected. Public revenues were to be stored in the Treasury building and in subtreasuries across the country. All payments to and by the federal government were to be in specie, and the Treasury would be completely independent of the country's banking system. In practice, however, the Treasury continued to exert influence on the banking system, because specie payments to and by the government affected the amount of gold and silver in circulation.

The Independent Treasury System was not ideal. It did restrain overspeculation, but it also kept gold and silver out of the market and tightened credit more than was necessary. The effect was to dampen legitimate economic expansion in good times and delay economic recovery in bad times.

Meanwhile, the banking and currency system underwent its own changes. Free-banking laws, enacted in New York in 1838 and adopted by about half the states by 1860, widened the banking system by permitting anyone to open

a bank who complied with stated statutory conditions. The number of banks swelled, each issuing its own banknotes. States imposed regulations on the banks, including reserve requirements and mandatory reports to public officials. Yet counterfeiting, speculation, and other abuses were commonplace. By 1852 nine of the 31 states, convinced that banks were incorrigible, prohibited banking altogether. Some have called the period from the demise of the Second Bank of the United States to the early 1860s the dark decades of American banking.

The situation did not improve substantially until the Civil War, when military necessity led Congress to revisit the Independent Treasury System and reform the banking system. The National Currency Act (1863) and the National Bank Act (1864) created a national banking system and national currency alongside the state banking system. The national currency took hold as a uniform medium of exchange after a tax on nonnational banknotes in 1865 made them unprofitable for their issuers. The Civil War-era legislation also established exceptions to the bans against placing government funds in private banks and paying the government with paper. Nevertheless, the subtreasuries continued in existence until 1921.

Also in flux throughout the early 19th century was the preferred metal for coining. At this time America's monetary system was on a bimetallic standard, in which both gold and silver could be coined without limit and were legally acceptable for payments. The ratio of value between gold and silver was fixed by legislation; for example, the Coinage Act of 1792 made 15 ounces of silver equivalent to one ounce of gold, a mint ratio of 15:1. In practice the commercial value of the metals was always changing, so that one metal was usually worth more on the open market than the mint ratio indicated. That metal was usually hoarded by members of the public, who tended to pay their debts with the commercially cheaper metal. In the early 19th century the commercial value of one ounce of gold was higher than 15 ounces of silver, so gold was hoarded as a metal while silver was coined and used as money. However, relatively few coins were minted each year, and paper money and foreign coins were widely used. In the Coinage Acts of 1834 and 1837, Congress changed the mint ratio to 16:1, and silver became undervalued at the mint. After 1849, with the commercial value of gold falling because of gold strikes in California, silver became the metal to hoard while gold was increasingly minted and used as money. In 1873, the United States shifted to a gold standard, abandoning bimetallicism altogether.

### Bank of the United States, Second (1816–1836)

The Second Bank of the United States existed between 1816 and 1836 as a controversial institution of national finance and economic regulation. The bank came into being in 1816, following the national financial difficulties that became clear during the WAR OF 1812 (1812–15). The war had been fought without benefit of a national bank, owing to its rejection by a divided Congress in 1811. Since 1814 members of Congress and a few wealthy Jeffersonian (Democratic-Republican) merchants had been publicly attempting to bring back a national bank. In 1816 President James Madison proposed a new national bank to institute and maintain a stable national currency in the absence of a consistent currency from the state banks. To Madison and the bank's supporters, the war had exposed considerable problems stemming from the lack of a national institution to raise revenue and stabilize the money supply.

The second bank's 20-year charter passed both houses of Congress and was signed into law by Madison in 1816. It represented one component of the economic nationalism that had become popular in the postwar years. Other components of economic nationalism included protectionist legislation and national INTERNAL IMPROVEMENTS. The prevailing theory behind the idea was to develop a more economically independent nation that was based on domestic production rather than foreign commerce. Maintaining a stable source of capital for the federal government was key to this effort and the overriding reason for another national bank.

The bank was established at a difficult financial moment due to a growing currency crisis over too many different and unequal banknotes in circulation. Under the direction of bank president William Jones, the new bank soon implemented a strict policy to build up its own reserves of hard money (specie) as a way to develop its own credit and satisfy a new United States Treasury requirement that all payments to the federal government be in specie. However, the plan did not work, and the bank soon resorted to borrowing specie from abroad and severely curtailing its own lending. The bank's actions contributed to the financial chaos that ensued as notes issued by rural southern and western banks plummeted in value and the central bank had no ability to provide regulation or direction. A severe economic depression took place in part due to the national financial problems, which coalesced into the PANIC OF 1819.

The bank's early years were also marked by substantial political and legal controversy. Many Americans remained unconvinced of the bank's legitimacy, and a grassroots movement to get rid of the institution emerged between 1817 and 1819. This led to a number of state legislatures passing taxes on branches of the bank that were designed to drive it out of business in their states. In Maryland, the branch bank at Baltimore refused to pay its exorbitant tax and took the issue to court under the direction of its president, James McCulloch. The case ended up in the Supreme Court as *MCCULLOCH V. MARYLAND* (1819) and stirred up a considerable amount of controversy in the process. Chief Justice John Marshall issued a definitive judgment for the bank and against the state of Maryland. The court's decision is an important one, since it defined the Supreme Court of the era as nationalist. It also spurred considerable anger among bank opponents who felt that the court had affirmed an unconstitutional act of Congress, which violated the states' rights principle that only state governments could charter and control banks.

Following the Supreme Court's action and under new management, the bank functioned as a repository for government funds, government creditor, and lending agent for state banks, and also contributed to the regulation of national finance through 1831. At that time old political antipathies against the bank resurfaced under the leadership of President ANDREW JACKSON. The bank became a major political issue in 1831–32 after Jackson vetoed its recharter. The bank's president, Nicholas Biddle, had successfully waged an early congressional campaign for an early recharter, but in doing so he aroused the ire of Jackson, a longtime opponent of the bank. After vetoing the recharter, Jackson used the issue in the election of 1832 by portraying himself as the people's champion against the business and political elites symbolized by the national bank. In his second term Jackson ended the federal government's close association with the bank by removing government deposits from it and relying instead on state banks for capital and repositories of federal funds. In the wake of the new circumstances, the bank severely curtailed its own credit allocations. After losing its federal charter in 1836, the bank won a state charter from Pennsylvania as the United States Bank of Pennsylvania. It continued to operate until 1841, when it went out of business due to excessive loans made on stock security rather than actual capital, and economic conditions caused by the PANIC OF 1837.

### Bear Flag Revolt (1846)

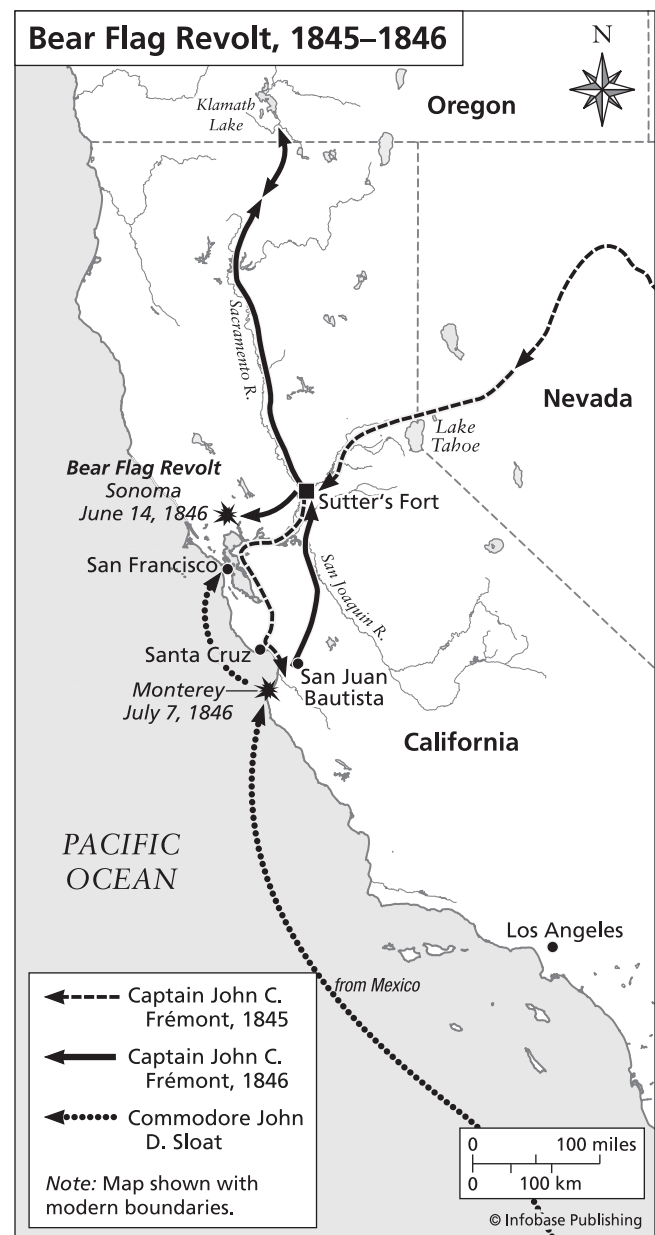

The Bear Flag Revolt was a rebellion against Mexican rule by American settlers in CALIFORNIA, who adopted a flag featuring a black bear. During the 1840s, the number of American settlers drawn to the Pacific coast was small but steadily growing. Lured by rumors of free land, the settlers began to swarm into California. Only 30 arrived in 1841, but by 1845 that number had increased to 250. The Mexican government at the time prohibited these settlers from owning land or holding office, but it was so involved with affairs closer to home that its influence over California was beginning to slip away. Many Californios—the Mexican population of California—were becoming increasingly dissatisfied with Mexican rule. At that time, it was feared that Mexico might transfer California to Great Britain in an effort to keep the region out of American hands, given the possibility of war over increasing tensions regarding the U.S.–Mexico border in TEXAS. Concerned that some foreign power might take control of California, President JAMES K. POLK sent his “confidential agent,” THOMAS OLIVER LARKIN, to make known to the Californios that they would be received as brethren should they decide to unite with the United States.

Early in 1846 U.S. Army captain JOHN C. FRÉMONT and a force of 60 men entered the Mexican province of Alta California, ostensibly to map the West Coast area. Although Frémont made contact with the Mexican authorities, his movement around the province was a point of consternation to Mexico’s northern regional commander, General José Castro. Although Frémont at first defied the Mexican authorities by establishing a temporary base at Hawk’s Peak near Salinas in the San Joaquin Valley, he withdrew northward to the region around Klamath Lake in the Oregon Country. There, in May 1846, he was contacted by an American agent, Lieutenant Archibald Gillespie of the U.S. Marine Corps, who instructed him to return to northern California and lend assistance if hostilities broke out between the United States and Mexico.

In the meantime, a group of American settlers heard about Frémont’s presence in California, and this was enough to spur them into action. Leaders of this group, who called themselves the “Osos” (Spanish for bears), included Ezekiel Merritt and William B. Ide. At Sonoma, California, the settlers under Merritt and Ide organized an uprising against the Mexican government, fueled in part by a simmering personal vendetta against the Vallejo fam-

ily, who wielded Mexican authority in the North. Added to this was the rivalry between General Castro and the civilian governor in Los Angeles, Pío Pico. Captain Frémont gladly accepted the 20 Osos and appointed Merritt as a lieutenant of the irregulars. On June 14, 1846, Merritt, Ide, and the American settlers rode into Sonoma and arrested Colonel Mariano Vallejo at his northern headquarters. With the acceptance of Colonel Vallejo’s surrender, the Osos declared California a republic, independent of Mexican rule.

Finding that they could not count on the support of Frémont and the U.S. military, some of the Osos wanted

to abandon the town and retreat. At this crucial moment, William Ide made a rousing speech declaring that he would rather die than retreat in disgrace. The party rallied around Ide, declaring him “president” of the new republic, and raised the famous Bear Flag.

On July 9, 1846, after learning that the United States had declared war on Mexico, the settlers lowered the Bear Flag and raised the American flag. California became a protectorate of the United States until it was made a state in 1850.

### **Becknell, William** (ca. 1790–1865) *trader*

A trader and explorer, William Becknell was probably born in Amherst County, Virginia, around 1790, but little is known of his early days. He apparently settled as a merchant in Franklin, Saline County, Missouri, just following the WAR OF 1812. In September 1821, to circumvent the effects of a nationwide depression, Becknell and four compatriots took a small convoy of pack animals from Missouri and into Colorado. They originally intended to trade with Indians along the southern Rocky Mountains, but while en route a group of Mexican soldiers informed them of Mexico’s newly acquired independence from Spain. Prior to this, Spanish officials had scrupulously arrested any American traders found on their territory, so Becknell was eager to market his wares in Santa Fe. He did so at considerable profit and determined to return the following year.

In August 1822, Becknell organized a larger expedition, including the first wagons laden with goods to travel west. However, this time he cut across the Kansas plains and followed the Cimarron River to the south and into New Mexico. It was a move calculated to circumvent the treacherous Colorado mountain passes and allow wagons to be taken directly to Santa Fe for the first time. However, this new route also occasioned considerable hardship to men and draft animals alike owing to its arid climate and lack of water. Nevertheless, Becknell’s expedition again proved successful and highly lucrative. Moreover, he had inaugurated a new trade route that came to be known as the SANTA FE TRAIL. This quickly developed into a major avenue of commerce with Mexico, and within a few years hundreds of traders and wagon trains were making the journey. Becknell’s success constituted a major turning point in the development of trade between the two nations and lent greater impetus for migration and settlement into the southwestern plains region. The sheer volume of trade,

coupled with the menace of hostile Indians, also impelled the government to assign the first sizable contingent of U.S. military forces on the southern plains.

In 1824 Becknell conducted an even larger expedition of 25 wagons and 81 men, again acquiring considerable profit. He is also known to have explored the region around the Green River Valley, Colorado, but this proved his final trading venture. By 1828 Becknell was operating a small ferry service on the Missouri River. That year he developed a taste for politics, and subsequently he was twice elected to the Missouri state legislature representing Saline County. In 1835 Becknell relocated to Texas, where he commanded a ranger company during the war for independence against Mexico. He eventually settled at Clarksville, Texas, dying there on April 30, 1865. His pioneering efforts established him as the “Father of the Santa Fe Trail.”

### **Beckwourth, Jim (James)** (ca. 1798–ca. 1866) *explorer*

African-American mountain man, trapper, trader, miner, and pioneer, James Pierson Beckwourth was born in Virginia, the son of Sir Jennings Beckwith (from a family of Irish aristocrats) and a mulatto slave woman. In 1810, his father moved to Louisiana Territory and eventually settled in St. Louis. Beckwith apparently freed his slave son when the young man reached legal age in Missouri.

In 1822 Jim Beckwourth (he had changed the spelling of his last name) was part of the rush to the LEAD MINES in northern Illinois. The important change in the direction of his life occurred in 1824, when he joined the supply caravan of WILLIAM HENRY ASHLEY to outfit the fur trappers in the Rocky Mountains. Ashley’s expedition became the first RENDEZVOUS at the Green River in the summer of 1825. Once in the mountains and exposed to the freedom associated with the lives of MOUNTAIN MEN, Beckwourth left Ashley’s employ and became a trapper, spending the winter of 1825–26 with the celebrated mountain man JEDEDIAH STRONG SMITH. Over the next few years, he followed the seasonal cycle of trapping during the winter and spring in the mountains, and enjoying the society of other mountain men at the annual rendezvous in the summer. He also took part in skirmishes against Indian parties. Although his main employer was the ROCKY MOUNTAIN FUR COMPANY, like

all trappers his allegiance was flexible. Mountain men generally owed loyalty to each other rather than to an absentee employer in St. Louis, Montreal, or London.

In 1828 Beckwourth was adopted into the Crow nation. He lived with the Crow for extended periods over six years and was married at least three times, to women from the Blackfeet, Crow, and Shoshone nations. He became an honorary chief of the Crow and joined them in raiding parties against other Indian groups, earning him the nickname "Bloody Arm." After he left the Crow, he used his influence to promote the trade in furs between Indian peoples and his new employer, the AMERICAN FUR COMPANY. In 1837 Beckwourth left the company's employ and went to Florida, where he served as a mule wrangler for a volunteer Missouri company in the war against the Seminole Indians. After he returned to St. Louis, he worked for Andrew Sublette (the young brother of WILLIAM SUBLETTE) in the Santa Fe fur trade. He then found employment as a teamster at BENT'S FORT, after which he became a trader in Taos and, in 1842, a settler on the land near Pueblo, Colorado.

Two years later Beckwourth left Colorado for CALIFORNIA, where he engaged in political intrigue against Mexican officials and worked as a horse trader (some said horse thief). With the arrival of American military forces in California on the outbreak of war with Mexico, Beckwourth served as a guide for the U.S. Army. After the discovery of gold in California, he immediately left for the mining camps, where he operated a ranch, trading post, and hotel, all occupations associated with the CALIFORNIA GOLD RUSH. Most significantly, in 1850 he discovered a pass through the Sierra Nevada that made access to California easier for miners and pioneers. It was named Beckwourth Pass and is still used today.

In 1854 Thomas D. Bonner, a New Englander who was also a justice of the peace in the gold country, interviewed Beckwourth and published *The Life and Adventures of James P. Beckwourth, Mountaineer, Scout, Pioneer and Chief of the Crow Nation*. This account, which established Beckwourth's reputation as a pioneer a generation across the West, has gone through several editions and is still in print.

Beckwourth returned to St. Louis in 1858, but when he heard news of the discovery of gold in Colorado, he immediately headed west again to work at his old occupations of supplier, trader, and storekeeper. Later, as a guide and interpreter, he joined the Colorado troops that massacred the Cheyenne camp at Sand Creek in 1864. He died in 1866 or 1867, at a place still in dispute.

### **Bent, Charles** (1799–1847) *trader, pioneer*

The oldest of four Bent brothers, Charles Bent was an important figure in the opening of the Southwest to Anglo-American settlement, a leader in the development of trade connections with Santa Fe, and one of the founders of the trading company that built BENT'S FORT. He was born in Charleston, Virginia (later West Virginia), the son of Silas and Martha (Kerr) Bent. His father was an educated man who constantly moved his growing family (ultimately seven sons and four daughters) to the West, eventually settling in St. Louis in 1806.

Charles Bent grew up in St. Louis, a frontier community energized by the Louisiana Purchase and the Lewis and Clark Expedition. He was always attracted to the fur trade. Before he went west, however, he attended Jefferson College in Canonsburg, Pennsylvania. He never received a diploma and what he studied is not known, but the years at Jefferson College showed that the Bent family valued education and a degree of formal learning rare on the frontier at the time. By 1822 Bent was a member of the MISSOURI FUR COMPANY; three years later, he became a partner in the company. The trade on the upper Missouri was both competitive and dangerous. The Indian groups, especially the Blackfeet, were often hostile. Both the Hudson's Bay Company and the AMERICAN FUR COMPANY offered continuous cutthroat competition. With the failure of the Missouri Fur Company, Bent turned his attention to the Southwest and the emerging trade with Santa Fe. He made his first visit to Santa Fe in 1829 as the head of a wagon train, experimenting with oxen as draft animals and organizing his train to defend against an attack by a large group of Kiowa Indians.

In 1830, with the pioneer merchant Ceran St. Vrain, Bent organized Bent and St. Vrain (later Bent, St. Vrain and Company), which would become the largest trading firm in the Southwest. Bent's brother WILLIAM BENT became an early partner, and their younger brothers George and Robert also joined the firm, which had trading stores in Taos and Santa Fe. In 1833, the company built BENT'S FORT on the upper reaches of the Arkansas to tap into the Indian trade. The fort became the center of an extraordinarily successful trading enterprise, with goods from Mexico and St. Louis exchanged for buffalo robes and beaver pelts. The fort also became the outfitting center for the last generation of Anglo-American MOUNTAIN MEN who trapped in the southern Rockies, and it possibly replaced the RENDEZVOUS, which disappeared after 1840. Certainly Bent's Fort performed the same kinds of function on a regular (not simply seasonal) basis: as a way to resupply, market furs, and provide recreation and sociability. Charles Bent pursued a policy of accommodation with the Indian peoples, and in 1842 his peace with the Comanche and Kiowa further expanded his trading range and options.

Increasingly interested in the economic development and politics of New Mexico (then part of the independent Republic of Mexico), Bent moved to Taos and married Maria Ignacia Jaramillo, a widow with a four-year-old daughter. The couple had five children of their own, two of whom died in infancy. As Bent's trading empire expanded, he became allied politically with Manuel Armijo, the Mexican governor of New Mexico, and used his influence with Armijo to extract several large land grants for favored friends. This favoritism made him powerful enemies. Yet despite his alliance with Armijo, when the MEXICAN-AMERICAN WAR began, Bent immediately supported the Americans. After the arrival of an American force under General STEPHEN WATTS KEARNY, Bent achieved great influence under the military occupation authorities, and Kearny made him governor of New Mexico. But the whole region of New Mexico was unsettled by the violence of war, which seemed to offer the opportunity to play out personal grudges. Bent had made many enemies. Various Indian groups resented his trade practices, while old Mexican (formerly Spanish) settlers were outraged by the large land grants with which he was associated. He had allied himself with one political faction, making enemies of the others. Although he had a Mexican wife and lived in a Mexican community, on the outbreak of war, he favored the United States and then became the political appointee of the conquering army. In January 1847 the Taos Indians rebelled against American occupation, and they assassinated Governor Charles Bent. Bent was 48 years old when he died, having lived a full and eventful life on the frontier of the Southwest.

### **Bent, William** (1809–1869) *trader, pioneer*

One of several brothers who pioneered in the development of trade in the Southwest, William Bent was an important figure in relations between Americans and Indian peoples in the generations after 1840. He was born in St. Louis in 1809, the younger brother of CHARLES BENT and the second son of Silas Bent, a native of Virginia. The elder Bent had moved to St. Louis in 1806 and was a deputy surveyor for the Louisiana Territory and later a justice of the supreme court of the territory from 1813 to 1821.

William Bent followed his brothers into the fur trade, trapping on the upper Arkansas in 1824 and then becoming a partner in trade with his brother Charles and another merchant, Ceran St. Vrain. When the company made the decision to build a trading fort on the upper Arkansas River, Bent supervised the construction and was also its

first manager. Indeed, the fort was sometimes called William's Fort because of his central role in its building and early operations.

Although he had trading ties to Mexico through Santa Fe, William Bent also favored the American side in the MEXICAN-AMERICAN WAR, which began in 1846. That same year, he guided General STEPHEN WATTS KEARNY's American army from Bent's Fort to Santa Fe. Upon the death of his brother Charles in 1847 and St. Vrain's retirement from the trade in 1849, William Bent became the sole owner of the firm and the fort. He subsequently offered to sell Bent's Fort to the U.S. government for what he thought was a reasonable price. The sale made sense, since the government already used the fort to outfit expeditions of exploration, and during the war against Mexico, it became a center of American military logistics. But the government refused, and, deeply affronted, William used powder stored there to blow up the fort, an act of destruction that he personally supervised. Three years later, he built another fort, generally known as New Bent's Fort, some 40 miles downstream.

Immediately on his entrance into the Southwest in the 1830s, Bent developed close relations with its Indian peoples. He liked the life of the MOUNTAIN MEN, and he liked trading with individual Indians and tribal groups. He had three marriages, each to an Indian woman. Of all the Bents, he was the one most associated with the open life of the frontier and the fur trade.

Even as Bent expanded his operations on the upper Arkansas with New Bent's Fort, the fur trade was in decline, and relations among Americans, Mexicans, and Indians were increasingly strained, in large part because of the war with Mexico. The COLORADO GOLD RUSH to the area of Pike's Peak in 1859 was a final act of closure. The large numbers of miners who crossed the plains that summer—something on the order of 50,000—forever fractured relations between Americans and Indians. The Great Plains had scant natural resources to maintain life throughout the year, and the march of thousands of settlers across the landscape endangered and depleted these natural resources. Physical confrontations were numerous and inevitable. Bent's trading empire, which had been based on forbearance and toleration in the interests of trade, was lost. Now the Americans, empowered by the doctrines of MANIFEST DESTINY, pursued gold, using whatever resources they needed, and they would thrust aside any individual or group that attempted to restrict them.

Bent worked as an Indian agent, attempting to bridge the gap between the two sides. The outbreak of the Civil War and the perceived Confederate threat to Colorado further inflamed relations. Periodic clashes degenerated into open warfare. The climax of this conflict was the attack of territorial volunteers led by Colonel John M. Chiving-

ton against a Cheyenne encampment at Sand Creek. The deaths of some 400 Indians might be said to mark the end of the world of William Bent, whose part-Indian son, Robert, participated in the battle.

Bent did leave one physical monument. A stockade that he built in 1857 at the mouth of the Purgatoire River became the site of an expanding community of settlers, the first American settlement within what would become the state of Colorado. The longest lived of the four Bent brothers, William Bent spent the remainder of his life in Westport, Kansas, near his longtime friend and fellow mountain man JAMES BRIDGER.

**Benton, Thomas Hart** (1782–1858) *U.S. senator and representative*

A leading Jacksonian Democrat, Thomas Hart Benton was a longtime, senator from Missouri. He was born during the American Revolution on March 14, 1782, in Hillsborough, North Carolina, to an affluent Loyalist family. His father died when the young Benton was only eight. As a youth of 16, Benton enrolled at the University of North Carolina at Chapel Hill. After a promising beginning, he was expelled for stealing money from his roommates. The memory of that shame and humiliation stayed with him for the rest of his life, driving him to prove himself worthy and to overcome his mistake. It also made him very touchy on questions of personal honor and perhaps kept him from running for president, lest his early scandal become general knowledge.

In 1799 the Benton family left North Carolina for Tennessee, where they owned land near Nashville. In 1809, at the age of 27, Thomas Hart Benton was elected to the Tennessee state senate as a Jeffersonian Republican. He served two years and was admitted to the bar in 1811. When the WAR OF 1812 broke out, Benton became a captain in the Tennessee Militia, which was commanded by Major General ANDREW JACKSON. Although Benton and Jackson initially got along well, trouble arose when a tavern brawl broke out involving, among others, Benton, his brother Jesse, and Jackson. In the confusion, one of the Benton brothers shot and wounded Jackson.

Sensing that his path to power might be blocked by Jackson in Tennessee, Benton removed to St. Louis, Missouri, where he became active in land speculation and banking and rose quickly in politics. He was, however, also involved in a duel in which he shot and killed his opponent, Charles Lucas, a U.S. attorney. Mortified by what he had done, Benton never dueled again. This scandal notwithstanding, Benton was elected one of the first two U.S. sena-

Thomas Hart Benton (Library of Congress)

tors from the new state of Missouri in 1820. During the campaign, Benton, who himself owned several slaves, was adamant in his opposition to all attempts to limit slavery in Missouri. Soon after becoming senator, in March 1821, he married Elizabeth McDowell, who came from a well-known Virginia family.

In the Senate, Benton quickly became known as a champion of “hard money,” working against the speculation of bankers, whom he blamed for the PANIC OF 1819. Early in his Senate career, he also became a strong advocate for the small farmer, and was especially interested in making western lands available to them at a cheap price and as quickly as possible. One idea he embraced, which anticipated the Homestead Act of the 1860s, was that settlers be granted 160 acres of land free if they improved the property over five years. He was an exuberant champion of American expansionism, declaring that the United States would eventually spread its institutions all the way to Asia. Marking himself as a firm democrat, Benton also urged, unsuccessfully, that the electoral college be abolished and that the president be elected directly by the people.

As Andrew Jackson became a serious candidate for president in the 1820s, he and Benton put aside their old feud and became political allies. Although he had supported HENRY CLAY in 1824, Benton was firmly in Jackson’s camp for the latter’s successful bid for the White House in 1828. He became President Jackson’s leading spokesman in the Senate, especially during the Bank War

of the early 1830s. He denounced the SECOND BANK OF THE UNITED STATES in flamboyant terms, saying that "All the flourishing cities of the West are mortgaged to this money power. . . . They are in the jaws of the monster! A lump of butter in the mouth of a dog! One gulp, one swallow, and all is gone!"

Benton so strongly favored "hard money," or gold and silver, over paper currency that he earned the nickname "Old Bullion." Benton also became staunchly opposed to southern proslavery champions such as JOHN C. CALHOUN of South Carolina, believing that their uncompromising views threatened the Union. As a firm supporter of western expansion, he also concluded that slavery hindered the movement of yeoman farmers into the West, and while he was by no means an abolitionist, he did think that the eventual demise of slavery was in the nation's best interests. This view put him at odds with many of his constituents and ultimately damaged his political fortunes. When MARTIN VAN BUREN ran for president in 1848 on a Free-Soil ticket that opposed the extension of slavery, Benton remained neutral, declining to support Democratic nominee LEWIS CASS. This, along with his opposition to the concessions granted to the South in the Compromise of 1850 (which was contrary to the wishes of the Missouri legislature), made him an increasingly isolated figure within the DEMOCRATIC PARTY.

Denied reelection in 1850, Benton made a political comeback when he was elected to the House of Representatives two years later. In Congress, he strenuously denounced the Kansas-Nebraska Act of 1854, which effectively repealed the MISSOURI COMPROMISE of 1820. However, his long political career came to a disappointing end when he was defeated for reelection in 1854 and then lost a bid for governor of Missouri in 1856. That same year, his son-in-law JOHN C. FRÉMONT, the husband of his daughter JESSIE BENTON FRÉMONT, ran for president as the first nominee of the Republican Party. Despite the family ties, Benton campaigned for Frémont's opponent, Democrat James Buchanan. A staunch unionist to the end, he feared that a Republican victory would mean the end of the Union.

In his retirement and facing death from cancer, Benton nevertheless managed to write one of the most valuable and important memoirs of American politics in the first half of the 19th century. Entitled *Thirty Years View*, the book was based on his recollections of the eventful years of 1820–50, in which he had played such an important role. He also published the *Abridgment of the Debates of Congress from 1789 to 1856*, finishing it less than a day before he died in Washington, D.C., on April 10, 1858.

### Bent's Fort

A trading post located in southeastern Colorado on the north bank of the Arkansas River near the mouth of the Purgatoire River, Bent's Fort was one of the most successful fur-trading posts on the Great Plains. In 1831 CHARLES BENT and Ceran St. Vrain established Bent, St. Vrain, and Company, which would become the largest venture of its kind in the Southwest. Previously, Bent had been a major trader with the MISSOURI FUR COMPANY. That company ceased operations in 1828, and a year later he refocused his efforts on the Santa Fe trade. By 1833, the company had set up stores in Taos and Santa Fe. That same year, they constructed Bent's Fort to confirm its presence and dominate the trade of the region. It lay 600 miles from the nearest American settlement in Missouri, and for many years it functioned as the only permanent community on the SANTA FE TRAIL between that territory and Mexico.

In considering the significance of the fort as a physical presence, it should be remembered that at the time of its construction, it was the most imposing structure of its kind in the 2,000 miles between the Mississippi River and the Pacific Ocean. As planned by WILLIAM BENT, Charles's brother and a partner in the firm, the fort was a large adobe structure, not quite rectangular, and built around an interior quadrangle. In its final form, Bent's Fort measured 137 feet by 178 feet. It was surrounded by walls 14 feet high and some 30 inches (three adobe bricks) thick. There was also an irregular second story in places, rows of apartments added as the numbers of permanent occupants of the fort grew in response to the growing trade. The structure was topped by a watchtower with a belfry that signaled the alarm and meals; atop the belfry was a flagstaff flying the Stars and Stripes. Some 150 Mexican laborers were brought from Taos to make the adobe bricks and lay them. These workers were probably paid \$10 a month, most of the wage in trade goods. When completed, in addition to warehouses for trade goods and living quarters for the permanent residents and itinerant visitors, the fort contained a kitchen, a dining hall, and shops for blacksmithing and carpentering. Rudimentary creature comforts, as well as the services of a barber and a tailor who lived on location, were available for the benefit of visitors. There was also, within the main court, a reliable well for fresh water, a press for packing buffalo, and a brass cannon. The entire structure was ringed with round bastion towers 18 feet high and 17 feet across that could serve as observation and firing platforms for the large number of skilled riflemen and frontier marksmen present. In 1839, a reporter for a New Orleans

newspaper estimated that the fort could garrison 200 men with twice that number of animals. It was the site of the first irrigation ditch constructed in Colorado and witnessed the first registered cattle brand employed in that region.

Bent's Fort was strategically located at the crossroads of a trading network that included the Cheyenne, Comanche, Arapaho, Ute, and Kiowa Indians. It was also situated favorably close to the path of migrating buffalo herds, which always drew large numbers of Plains Indians and had ample supplies of fresh water. These dispersed peoples traded buffalo robes, animal hides, and beaver pelts with the Bent brothers and St. Vrain. Charles Bent was himself married to a Southern Cheyenne woman, which gave him a distinct advantage when trading with the members of that tribe. The fort also did a substantial business with Mexican traders and white trappers, as well as with the army. The fort kept on hand a large number of horses and mules that were always in demand. Bent's Fort also outfitted U.S. Army exploratory expeditions into the Southwest. The Bent brothers had an anchor at the west end of the Santa Fe Trail, with connections to the army, to Mexican officials in Santa Fe, and to the most important white trappers of the period as well as leading Indian trading groups. Thus, Bent's Fort had powerful political influence, making it more than just a trading post. Unlike many similar enterprises in the American West, Bent's Fort was soundly financed, with established financial backers and lines of credit. Business was conducted with a high degree of integrity, as the Bents sought to maintain a balance among diverse groups of people. They soon established a principle that any conflicts among their clients should not be played out at the fort. As a result, Bent's Fort became an island of peace in a region of growing unrest.

The strategic location of the fort was, in a sense, its undoing. As the U.S. government became more interested in the Southwest, the military presence increased. Although the army was a good customer, it had the effect of inhibiting other trading groups, many of whom resented both its presence and its expeditions. The success of the TEXAS REVOLUTION and the establishment of the independent Republic of Texas contributed a national edge to the tensions of the region. The Republic of Mexico refused to recognize the independence of Texas and conducted an ongoing armed struggle over independence and boundary lines. Texas, for its part, embarked upon an expansionist policy that included claims to the upper reaches of the Rio Grande and, finally, a military expedition against Santa Fe. That this expedition was a fiasco did not lessen the sense of uneasiness over the lack of stability in the region. The outbreak of the MEXICAN-AMERICAN WAR in 1846 was a final blow to trading patterns that had depended on peace and forbearance among the many groups involved. That year the fort served as the staging area for the 1,700-man Army

of the Southwest led by General STEPHEN W. KEARNY, who commandeered it as a military outpost during initial phases of his bloodless conquest of New Mexico.

Charles Bent, appointed the first American governor of New Mexico, was assassinated in the Taos Indian rebellion of January 1847. The TREATY OF GUADALUPE HIDALGO ceded the landed area of northern Mexico to the United States, including California and the future states of Arizona and New Mexico, and ended the war. In 1849 William Bent offered to sell Bent's Fort to the U.S. government. The price seemed reasonable, but the government refused, apparently believing that the fort would eventually come into its possession for nothing. Angered by this snub, Bent blew up the fort with gunpowder on August 21, 1849. Four years later, he built a new fort 40 miles downstream, which he leased to the government in 1860. A few years later the original site was rebuilt and functioned as a stage coach station and a frontier settlement, but the locale's heyday had clearly passed.

Bent's Fort was a powerful presence in the Southwest for 16 years. Located at the intersection of streams of Mexican, Indian, and Anglo-American trade and exploration, the fort served as a peaceful gathering point for diverse elements of Indians, trappers, and soldiers. It was a large and impressive physical presence, which dominated the landscape even as it controlled the fur trade. As the largest trader's base in the region, Bent's Fort was also influential in directing the fur trade north and east toward St. Louis rather than south and west to Mexican settlements.

In recognition of its historical significance, Bent's Fort was declared a National Historic Site. In 1960 the National Park Service began an elaborate scheme to restore it exactly as it had been in the 1840s. Work was finally completed in 1976, and the fort remains a popular tourist attraction.

**Bidwell, John** (1819–1900) *pioneer, politician*

A California pioneer, politician, and rancher, John Bidwell was born in upper New York State in 1819 and later moved with his family to Pennsylvania. In 1834 the family relocated again to Darke County, Ohio, and two years later

young Bidwell, determined to gain an education, walked 230 miles to Ashtabula to attend the Kingsville Academy. He proved himself something of a child prodigy: Within a year he was elected principal of that institution. In 1838 Bidwell returned home to teach for a year, but gradually he grew enthralled by better prospects farther west. In 1839, he claimed a 160-acre tract near Weston, Missouri, that he subsequently lost to a claim jumper. He then made the decision to go to California, and in the winter of 1840–41, he organized the Western Emigration Society and signed up some 500 members to make the trip west. When the caravan left in the spring, he had 69 emigrants in his party. As Bidwell had no experience in traveling to the West, he signed on a group of MOUNTAIN MEN led by Thomas Fitzpatrick. At the Bear River in Idaho, the party divided; the Oregon emigrants headed west with the fur trappers, and the California group turned south. The California party suffered great hardships, got lost, and were hungry much of the time. Arriving in California on November 4, 1841, Bidwell's party was the first to make the journey over what would become the CALIFORNIA TRAIL.

Once in California, Bidwell found work at Fort Sutter. He clerked with JOHN SUTTER for several years. In 1844 Bidwell became a naturalized Mexican and also received a grant of land. That December he rallied to the side of Governor Micheltorena against rebels, but he was captured and imprisoned by them for several weeks. In 1846, on the outbreak of the BEAR FLAG REBELLION, he joined the American rebels and rose to the rank of major. In this capacity he accompanied Colonel JOHN C. FRÉMONT's California Battalion south to Los Angeles, becoming magistrate of the San Luis Rey district. A revolt by Mexican nationals subsequently drove him to San Diego, where he joined up with Commodore ROBERT STOCKTON's forces as a quartermaster. He then assisted in the reconquest of Los Angeles. At the close of the MEXICAN-AMERICAN WAR, he prospected in the CALIFORNIA GOLD RUSH without success, and in 1849 he received a grant of 22,000 acres in Northern California. This would become the Rancho Chico, which later gave its name to a nearby town. For the rest of his life, Bidwell worked to develop his ranch, and over half a century, he became a pioneer in California agriculture.

Bidwell was also politically active. In 1849 he was chosen as a delegate to the state constitutional convention, although he was informed too late to serve. He later won election to the state senate as a Democrat. Bidwell opposed secession, and in 1860 he attended the party convention in Charleston, South Carolina, as a supporter of Stephen A. Douglas. With the approach of the Civil War in 1861 he switched over to the Union Party, a move that resulted in his appointment as brigadier general of the California militia in 1863. He was elected to the California House of Representatives in 1864, and he ran for governor three times

without success. In 1892 he was the presidential candidate of the National Prohibition Party. His lack of success never dimmed his interest in political life, although the ranch and its development remained his main interest. He was also acutely interested in the well-being of local NATIVE AMERICANS around his ranch and spent considerable time, effort, and money attempting to teach them rudiments of agriculture. He also served as a regent of the nascent University of California and donated land to construct a state normal school. Bidwell apparently never lost his sense of civic obligation. At the time of his death in 1900, he was probably the most celebrated agriculturalist in California. Bidwell's life spanned the continent from East to West and over the best part of the 19th century. At a time when much of California was mesmerized by mining, he saw its future in agriculture.

## Black Hawk War

The Black Hawk War of 1832 was the last attempt of the Sac (Sauk) nation to hold on to their traditional fishing, hunting, and planting grounds on the east side of the Mississippi River, in what is now Illinois and Wisconsin. Their defeat signaled an end to Native American resistance east of the Mississippi River and the beginning of white encroachment onto the prairies and upper Great Plains. Along with the SECOND SEMINOLE WAR and the Cherokee TRAIL OF TEARS, the Black Hawk War demonstrated President ANDREW JACKSON's determination to relocate Native Americans en masse.

Black Hawk, or Makataimeshiekiakiak (1767–1838), was the war chief of the Sac at a time when pressure from white settlers had begun to mount. He fought with Shawnee chief TECUMSEH on the side of the British during the WAR OF 1812. Previously, Sac representatives had signed the first treaty of land cession in 1804, giving up their territory east of the Mississippi River. At that time Governor WILLIAM HENRY HARRISON diplomatically stipulated that the tribes would be allowed to remain on their land until

such time that the whites were ready to settle there. The fact that this process took over two decades compromised chances of a peaceful evacuation of the area. In 1816, at another treaty gathering at Fort Armstrong on Rock Island, Black Hawk and other Sac chiefs confirmed the original cession, although the Indians surely did not understand fully its final nature. Taken together, these treaties evicted the Sac and their allies, the Fox, from their fertile homelands on and near the Rock River in Illinois and Wisconsin.

As American settlers moved to the West in increasing numbers, the time for the Sac's evacuation approached. With the help of Indian agents, a substantial portion of the Sac under the leadership of Chief Keokuk moved across the Mississippi River into Iowa and established new villages. Black Hawk, however, refused to leave the old territory, remaining at the principal Sac village, Saukenuk (now Rock Island, Illinois). The local Indian agent continued to press for his departure, and white settlers began to occupy tracts of land around the village—even claiming the village graveyard and Black Hawk's own lodge. His followers spent several nervous months in close proximity to the white intruders, but no violence resulted. Before leaving for the seasonal hunt in winter 1830–31, Black Hawk told the squatters that he and his band would return again in the fall. At this Governor John Reynolds of Illinois declared that the state was being invaded. Consequently, General Edmund P. Gaines sailed north from St. Louis, Missouri, with a detachment of U.S. Army troops and several armed steamers. In autumn 1831, under threat from the Illinois militia, Black Hawk finally moved his people across the Mississippi.

Black Hawk had made the journey to Iowa, but he remained irate over the treaties of cession. Over the winter, he gathered around him others who were discontented over the land cession and some who objected to Keokuk's leadership. Black Hawk believed that in the event of an armed clash with the Americans, the British would send supplies from Canada as they had so many times in the past. He also believed that the Winnebago in Wisconsin would support his resistance. Driven by the desire to return to his village and confident of Winnebago assistance, he crossed the river into Illinois on April 6, 1832, in a futile attempt to reclaim his native homeland. His party, numbering perhaps as many as 1,000, included a large number of warriors as well as women and children. They initially moved up the Rock River to a Winnebago village where, Black Hawk later stated, he had come to grow a crop of corn. When word of Black Hawk's return reached the frontier settlements, families began to flee their homes. A military force of volunteers and regulars, under the command of General HENRY ATKINSON, moved north to confront Black Hawk and force his return to Iowa. Moreover, the federal Indian authorities' demand that the rebels recross the Mississippi

Black Hawk (Hulton/Archive)

immediately was backed by the Sac and Fox tribal councils. Black Hawk now recognized that his hopes of assistance from the Winnebago and the British were without foundation. By May 9, the Indians had proceeded as far as Stillman's Run, where they confronted a skittish party of American militia. He attempted to surrender in order to ensure the safe conduct of his band across the river, but overeager soldiers fired on his flag of truce, and one of his negotiators was killed. Black Hawk assumed that henceforth the only recourse for himself and his band of followers was war.

As Black Hawk and his party of warriors began to raid isolated settlements, the civil population and state political leaders demanded the active intervention of Illinois militia volunteers and the U.S. Army. The ranks of the volunteers were rapidly swelled by those anxious to battle against an ancient enemy of barbarous reputation, and editors and politicians led the cry for the use of overwhelming force in a campaign to be conducted without mercy.

In May Black Hawk won a series of bloody skirmishes, but the state and federal forces continued to gather strength. By midsummer, about 8,000 members of the Illinois state militia (including the future president Abraham Lincoln, elected captain of his company) and several

companies of federal troops had arrived on the scene. Black Hawk led his Sac band in a retreat north toward Wisconsin, but their mobility was severely restricted by the presence of women and children. Throughout the march north, the Indians had to forage for food as they moved, increasingly harassed by pursuing soldiers. The troops followed them across northern Illinois and into Wisconsin. In July, at the Wisconsin River, the troops and militia defeated a portion of the Sac force, using a steamboat-mounted cannon.

Meanwhile, General WINFIELD SCOTT had assembled a force of 1,000 regulars in Buffalo, New York, and boarded steamers for the voyage across Lake Erie to Chicago. En route the soldiers contracted cholera, which spread rapidly among them. Nearly the entire force was infected by the time they reached Chicago, at which point Scott abandoned any notion of lending military assistance. He remained in place to tend his sick and dying soldiers. It was a stunning display of this pathogen's mortality: Just 200 survived.

Still led by Black Hawk, the remaining Sac continued to retreat. At the Bad Axe River, a small tributary of the Mississippi, they were trapped by the militia and 1,300 newly arrived federal troops. These were backed by the newly arrived steamboat *Warrior*, which mounted a single cannon and controlled the river. There, on August 3, as Black Hawk and his band attempted to cross the Mississippi, they were defeated in what came to be known as the Battle of Bad Axe. Troops firing from the shore and boats virtually annihilated the Indians exposed in open boats. Only a remnant of the original band reached the safety of Iowa. These had no sooner arrived than they were set upon by Sioux warriors, their traditional enemies, who added to the heavy death toll.

The so-called Black Hawk War lasted about four months. It was characterized by few encounters, but these produced numerous casualties. Killed on each side were an estimated 70 soldiers and settlers and between 450 and 600 Indians. Most of the Indians were killed in the crossing of the Mississippi in August, although some were killed by the Sioux, ancient enemies of the Sac and Fox who attacked the survivors.

Black Hawk and a small number of his band survived the battle and fled to safety in a Winnebago village. They surrendered on August 27. The terms of the peace treaty were dictated by Governor John Reynolds of Illinois and General Winfield Scott representing the U.S. Army. As punishment for the war, the Sac were forced to cede the eastern half of their Iowa territory, a 50-mile wide tract of land running from the southern boundary of the neutral line to the Missouri border—some 9,000 square miles of land. Under the terms of the treaty, the Indians pledged never again to claim or attempt to plant, fish, or hunt in their old home in Illinois. In exchange for the large ces-

sion of land, the government of the United States assumed debts of the Sac band up to \$40,000 and promised an annuity of \$20,000 a year for 30 years, plus 40 barrels each of tobacco and salt.

Once captured, Black Hawk was escorted by Lieutenant Jefferson Davis, future president of the Confederacy, from Wisconsin to Jefferson Barracks, Missouri, and from there to the east. After being imprisoned for a time in Virginia, Black Hawk was conducted on a tour of eastern cities, during which he met President ANDREW JACKSON. The chief also dictated his memoirs for publication, which added to his national celebrity. In his memoirs he bitterly denounced whites for their lies and treachery toward Native Americans. When he finally returned to Iowa, Black Hawk was allowed to settle on the Sac and Fox reservation lands governed by Keokuk. He died there in 1838, near Fort Des Moines, Iowa.

The Black Hawk War was a brief but intense confrontation between Indian peoples being forced from their lands and the advancing American settlers who intended to occupy them. It was a rare interlude of war in the generally peaceful period between the close of the War of 1812 and the outbreak of the wars against the Seminole. The Black Hawk War reflected divisions within the Sac nation, as Black Hawk led a dissident group that refused to accept Keokuk's leadership of accommodation. It recalled the support of the British and the confederation of several Indian nations (associated with Tecumseh) to block the further cession of Indian lands. It also spotlighted the continuing view of white Americans that Indians were basically treacherous and not to be trusted, that they waged war in the most barbaric manner, and that they could only be dealt with by the use of overwhelming force. And in a new state like Illinois, where the removal of Indians had become a powerful political issue, the cry of politicians for the use of the state militia and the summoning of units of the federal army meant that only a military solution was possible.

**Bloomer, Amelia** (1818–1894) *women's rights and temperance activist, publisher*

Although her name has become synonymous with a particular type of dress reform, Amelia Bloomer's greater claim to fame is as a publisher, editor, lobbyist, women's rights activist, and member of the TEMPERANCE MOVEMENT. Born Amelia Jenks in Homer, New York, on May 27, 1818, Bloomer attended a local school and spent a great deal of time in personal study. As a young adult, she worked as both a teacher and governess. In 1840 she married a Quaker named Dexter Chamberlain Bloomer in a service where she omitted the promise to "obey." The couple established a home in SENECA FALLS, New York, where her husband was a newspaper editor. There Amelia Bloomer became increasingly interested in matters of social justice and formed a lifelong commitment to the issue of temperance. She also took up a position as the deputy postmistress of Seneca Falls.

In July 1848 the first women's rights convention convened in Seneca Falls. Bloomer attended the two-day event but had strong reservations about the ideas that she heard there. Four years later, Elizabeth Cady Stanton, one of the organizers of the event and a leader of the women's rights movement in the United States, would recall in a letter to Susan B. Anthony that Bloomer "stood aloof, and laughed at us." Nevertheless, Amelia Bloomer would go on to become a fierce champion of women's rights. The first step in that process was the January 1849 publication of *The Lily*, a monthly publication that initially focused on temperance issues and cost 50 cents for a year's subscription. Bloomer was the newspaper's owner, publisher, and editor. While other women had owned newspapers in the United States, she was arguably the first woman editor of such a publication. Over time *The Lily* grew in circulation and scope. Approximately 300 subscribers bought the newspaper in its first year; in four years that number had swollen to 6,000. Thanks to contributions from women such as Elizabeth Cady Stanton, the paper grew to tackle questions of suffrage, legal marital rights, and public policy. It also became a vehicle for the advocacy of dress reform.

Fashion and culture dictated that free women in mid-19th century America should wear a very specific style of clothing. Small waists were imperative, so women wore tight corsets lined with steel or whalebone and laced at the back in order to achieve this end. Corsets were uncomfortable, could displace internal organs, and made it difficult for women to breathe or move about easily. Large skirts, supported by layers of petticoats and hoops, also emphasized a woman's small waist. The effect often required 20 petticoats at a time, and the entire costume could weight between 15 and 30 pounds.

Dress reform was not a frivolous issue. A woman's freedom of movement and therefore her liberty of person

were intrinsically tied to what she wore. Numerous women's rights advocates such as Elizabeth Cady Stanton, Susan B. Anthony, LUCRETIA MOTT, and ANGELINA AND SARAH GRIMKÉ therefore adopted a style of dress that eliminated

Amelia Bloomer wearing the "trousers" she designed, which were called "bloomers" (Hulton/Archive)

the corset, shortened a woman's skirt, and added a pair of loose trousers to the outfit, gathered at the ankles. The costume was most likely introduced to the group by Elizabeth Smith Miller, yet since Bloomer not only wore the outfit but promoted and defended it in *The Lily*, she became most famously associated with it.

The Bloomer costume was ridiculed in the press. Opponents believed that it was immodest, that it compromised a woman's femininity, and that it was an example of the gross disorder that would result from allowing women to tamper with American culture and law. While the publicity and debate surrounding the costume was helpful to women's rights advocates for a time, they ultimately feared that it would undermine their efforts to effect other kinds of change. One by one, the advocates went back to their old styles of dress.

Bloomer continued to work on temperance and women's rights issues throughout the 1850s, and she began giving public lectures on such subjects after 1852. In the mid-1850s, Bloomer moved to Mt. Vernon, Ohio, with her husband, and later to Council Bluffs, Iowa, where she adopted and raised two children. *The Lily* was sold to Mary Birdsall in 1856, but this did not mark the end of Bloomer's activism. She continued to write, became involved in local groups such as the Good Templar lodges, and worked in the Soldiers Aid Society during the Civil War. After the war, Bloomer went on to petition Congress for the political rights she felt were owed her for her payment of taxes, as well as to lobby for woman suffrage both in Iowa and across the United States. She died in Council Bluffs on December 30, 1894, 26 years before American women finally gained the right to vote.

### **Bodmer, Karl** (1809–1893) *Swiss artist*

Considered one of the premier frontier artists of his day, Karl Bodmer was born near Riesbach (Zurich), Switzerland, on February 11, 1809, the son of a cotton merchant. He was apprenticed to his uncle, noted draftsman Johann Jakob Meier, for the purpose of learning art, and was tutored in sketching, engraving, and water colors. He subsequently received advanced artistic training in Paris while studying under Sebastian Cornu. By 1828, Bodmer had settled in Germany, where he enjoyed considerable

success as a landscape illustrator. Even at this early stage, his art was well received and frequently utilized for book and magazine engravings. In 1832, while traveling in the Moselle region, Bodmer met Prince Alexander Philipp Maximilian von Wied, a naturalist and explorer of some repute. This aristocrat had previously undertaken an extensive exploration of the Brazilian coastal forests in 1815–17, which was subsequently published. The prince at this time was contemplating an extended journey in the American West for the purpose of studying Native American tribes, flora, and fauna. He naturally required an artist to chronicle the sights, and Bodmer readily agreed to accompany him. In July 1832, both men arrived at Boston, Massachusetts, and they spent several months wintering in Bethlehem, Pennsylvania, and New Harmony, Indiana, in preparation for their outing.

In March 1833 Bodmer's party arrived at St. Louis, Missouri, and contracted with the AMERICAN FUR COMPANY for transportation up the Missouri River. Their sojourn commenced by steamboat up to Fort McKenzie (present-day Great Falls, Montana), which largely retraced the steps of Lewis and Clark three decades earlier. While at Fort McKenzie, Bodmer became intimately acquainted with the Blackfeet men residing there. The Indians he encountered proved amicable and cooperative, although periodic wars among them made travel somewhat hazardous. While soliciting portraits, he witnessed a surprise attack on the Blackfeet by Assiniboiné and Cree Indians, an event he later rendered as a painting. Bodmer and the prince then traveled south to winter at Fort Clark (modern Bismark, North Dakota), where they wintered among the Mandan and Hidatsa Indians. It was here that Bodmer produced some of his most impressive and significant works, capturing on canvas numerous and long-forgotten tribal ceremonies, costumes, and scenes from everyday life. He plied his craft by producing around 400 watercolors, including landscapes and Native American portraiture. Bodmer had thus become the first European artist to venture west of the Mississippi River and, as events proved, among the most talented and prolific.

Though never previously known for portraiture, Bodmer's work established him as one of the premier frontier artists of his day. In fact, he is celebrated for his uncanny ability to render highly lifelike, detailed renditions of his subjects. His use of color, lighting, attire, composition, and facial expression render his techniques superior to his closest American contemporary, the celebrated GEORGE CATLIN. Collectively, his work constitutes a valuable historical source of ethnographical information, and it is seldom matched as artwork.

Within a year, Bodmer and Maximilian departed the West for New York, and they arrived back in Europe by July 1834. Ironically, within a few years of their depar-

ture, the Mandan Indians with whom they had become so well-acquainted were nearly wiped out by smallpox, a disease introduced by white men. Bodmer's paintings are an important historic record of their way of life.

Once home, Maximilian published a detailed account of his experiences, *Travels in the Interior of America*, in 1838. The book featured 81 engraved aquatints based on Bodmer's watercolors, and the artist ventured to Paris in 1836 to supervise preparation of the plates for publication. The book was well received and ultimately published in German, French, and English editions, but, being a limited edition and highly expensive, it failed to produce the wind-fall expected. Nevertheless, the book is generally regarded as one of the greatest examples of Native American iconography published in the first half of the 19th century.

This publication concluded Bodmer's collaboration with Maximilian, and he subsequently settled among the artistic community of Paris. But for many years thereafter, his American works were continually engraved and reproduced for various publications, being copied, recopied, and embellished by innumerable European and American artists. It is likely that few, if any, of these individuals had ever beheld a live Native American.

The remainder of Bodmer's artistic career proved productive, but critically unremarkable. Around 1850, he became part of the flourishing Barbizon art community south of Paris and struck up useful relationships with such early impressionists as Théodore Rousseau and Jean-François Millet. He initially sustained his previous reputation as an illustrator and engraver of popular magazine illustrations. As late as the 1860s, his watercolors remained standard fare throughout the numerous Paris art salons, and in recognition of his work, he received the prestigious Legion of Honor from the French government. By the 1880s, however, his artistic style was soon increasingly passé, and a period of financial distress ensued. Bodmer died at Paris in poverty and relative obscurity on October 30, 1893.

The majority of the paintings produced by Bodmer during his North American sojourn remained with the family of Prince Maximilian. These were largely forgotten until after World War II, when they were successively purchased by a New York art gallery, the Northern Natural Gas Company, and the Joslyn Art Museum, the latter two both of Omaha, Nebraska. Bodmer's works thus remain on permanent display not far from the region which inspired their creation and are still highly regarded depictions of the early upper Missouri region. Ironically, Bodmer himself came to regard his American interlude with regret, feeling that the experience had actually retarded his growth as an artist.

### **Boudinot, Elias** (ca. 1803–1839) *editor, writer*

The Cherokee editor Elias Boudinot was born into the CHEROKEE Nation near Rome, Georgia, around 1803. Originally named Galagina (Male Buck), he belonged to a prominent tribal family. His father, David Oowatie, was an individual of some repute, and his younger brother Stand Watie later became a Confederate general. The Cherokee were by this time partly acculturated by their exposure to American settlers, and in 1818 Galagina was sent north to attend a missionary school in Cornwall, Connecticut. His benefactor in this regard was the New Jersey philanthropist Elias Boudinot; Galagina adopted his name as a token of respect. Boudinot performed well in his studies, progressing to Andover Seminary in 1822. But he stirred controversy when he fell in love with a local white girl, Harriet Ruggles Gold, and married her over parental objections. This act led authorities to close the Indian school in Cornwall.

Boudinot returned home to his tribe in Georgia in 1823. In 1828 his countryman SEQUOYAH developed the Cherokee alphabet, and in that year Boudinot, with his relatively strong education, was appointed editor of the tribal newspaper *Cherokee Phoenix*. He thereby became the first Native American editor of a major publication. Boudinot wrote extensively in his native language. Later, in 1833, he published the first novel in the Cherokee language, entitled *Poor Sarah; or, The Indian Woman*.

In the 1820s and early 1830s, Georgia authorities were buffeting the Cherokee with demands to sell their lands and migrate west. The tribe was increasingly torn by factions both for and against relocating. Boudinot, printing in both English and Cherokee, argued strenuously against the sale of any tribal holdings. A major shift in Boudinot's career occurred in 1832, however. After returning from a fund-raising event in Boston, he switched sides and advocated selling traditional Cherokee lands under the best possible terms before they were seized by whites. This stance brought him in direct conflict with Chief JOHN ROSS, who vigorously condemned the practice of selling land without consent of the entire tribe. As a result, Boudinot was forced out as editor.

By 1835 the so-called Treaty Party, consisting of those who were willing to sell their land to the American government, had evolved within the Cherokee nation. That year Boudinot, JOHN RIDGE, Major Ridge, Stand Watie, and other Cherokee visited Washington, D.C., and signed the Treaty of New Echota for the tribe's removal to the Indian Territory. This was accomplished without the consent of Ross and other senior chiefs, but on May 23, 1836, the U.S. Senate ratified the treaty by a single vote. The treaty set in motion the notorious TRAIL OF TEARS, whereby one fourth of the Cherokee died en route to new homes in the West. Boudinot established himself in Indian Territory in September 1837 and resumed his publishing activities, principally the translation of the New Testament and other religious tracts into Cherokee. Tribal loyalists, however, never forgave him for his role in signing the relocation treaty, and on June 22, 1839, Boudinot, the Ridges, and others associated with it were assassinated in Park Hill, Arkansas.

**Bonus Bill** (December 23, 1816; vetoed March 3, 1817)

The Bonus Bill promised to provide federal funding for roads and canals, but President James Madison vetoed it in 1817 because he believed the U.S. Constitution did not grant the power to provide money for INTERNAL IMPROVEMENTS.

With the increase in population and territory, the expanding market ECONOMY, and the introduction of steam-powered ships, the United States needed a new infrastructure of roads and canals. The WAR OF 1812 (1812–15) convinced even many Democratic-Republicans that the federal government had to provide assistance in its development. The eloquent South Carolinian congressman JOHN C. CALHOUN passionately advocated programs to enhance the wealth and power of the American nation. The main problem was the funding of such expensive programs. Most Americans rejected the idea of federal taxes. In the face of this opposition, Calhoun proposed a bold plan, the so-called Bonus Bill to raise funds for the construction and maintenance of roads and canals.

On December 16, 1816, Calhoun recommended that the House of Representatives appoint a committee to investigate the possibilities of creating funds for internal improvements by tapping into the profits of the SECOND

BANK OF THE UNITED STATES. Calhoun, the chairman of this committee, introduced a bill on December 23, 1816, to appropriate a \$1.5 million bonus payable to the federal government for chartering the bank and the future profits of the bank stock owned by the government. The plan would have provided for a series of canals and roads across the Appalachians, improvement of river transportation on the Ohio and Mississippi Rivers, and a NATIONAL ROAD to the Deep South through the interior to New Orleans. With the support of HENRY CLAY, the Bonus Bill passed both houses.

To the surprise of Calhoun and many congressmen, President James Madison vetoed the bill on March 3, 1817, two days before he left office. Although Madison supported federally funded internal improvements, he objected to the bill on the grounds that the constitutional power to provide for the “common defense and general welfare” did not authorize the national government to subsidize internal improvements. Madison recalled that the power to build federal canals had been explicitly rejected in the Constitutional Convention of 1787. Thus, he objected to the doctrine of implied powers in the “general welfare” clause of the Constitution. However, he suggested an amendment to the Constitution to allow for the appropriation of funds for federal projects.

After attempts to pass an amendment or override the presidential veto failed, New York State began building the ERIE CANAL without federal support in 1817. The issue of federal funding and planning for internal improvements was raised again in 1822 when Congress sought to collect tolls on the Cumberland Road; it was finally settled by Jackson's Maysville Road Veto in 1830.

**Bowie, Jim** (1796–1836) *pioneer, soldier*

One of the legendary figures of the early TEXAS frontier, James (Jim) Bowie is best known for his death at THE ALAMO in 1836 and for the hunting knife he helped to make famous. Although the details of his birth are sketchy, Bowie was most likely born in Logan County, Kentucky, in 1796 to Rezin and Elvy Jones Bowie. The Bowie family was of Scottish ancestry and had been in America since the early 18th century. When he was a boy, young Jim moved with his family to Rapides Parish, Louisiana, shortly before the United States bought that land from France as part of the Louisiana Purchase.

In early 1815, Jim Bowie and his older brother Rezin enlisted in the Louisiana Militia and started out for New

Orleans to join General ANDREW JACKSON's army. However, the BATTLE OF NEW ORLEANS concluded before their arrival. After the war, Bowie joined a group of adventurers, including his brother, who went to Texas in the hope of separating that land from Spain. The Bowie brothers became involved with the pirate JEAN LAFITTE in a scheme to smuggle slaves into Louisiana, by then one of the United States, through Texas. It was at that point that Bowie first began to acquire a reputation as an especially tough character who was more than willing to defend his interests and honor with his fists and any other available weapon. It was in one of his many fights that Bowie supposedly first used the knife that was later named for him. However, it is quite possible that his brother Rezin actually designed the knife, which many on the southwestern frontier used.

Bowie went back to Texas and was baptized into the Catholic Church, which Mexican authorities required for all those who desired to settle there and own land. He also married Ursula María de Veramendi, whose father was a vice governor of one of the Mexican states. This union with the daughter of a wealthy man boosted Bowie's financial fortunes considerably. Although his search for a lost mine in Texas yielded no riches, his reputation as a tough frontiersman grew when he led a group of adventurers in fighting off a party of raiding Caddo Indians; he barely escaped with his life. Bowie experienced personal tragedy when a cholera outbreak claimed his wife Ursula in 1833. Still seeking wealth, he turned to a more profitable venture: land speculation. He acquired the title to considerable acreage in Texas by persuading Mexicans to apply for land grants and then buying the land from them for a reduced price.

In the 1830s, tensions developed between those who favored more autonomy for Texas and those who wanted a closer connection to the central Mexican government in Mexico City. Bowie sided with other expatriates from the United States who were increasingly skeptical of Mexican authority and were beginning to agitate for resistance. He fought with Texans in the Battle of Nacogdoches in 1832, one of the early confrontations in what became the TEXAS REVOLUTION. When that movement grew more serious two years later, Bowie became one of its leaders as a member of the first committee of safety. He later became a colonel in the fledgling Texas army, fighting to expel Mexican troops from Texas in 1835. When Mexican president ANTONIO LÓPEZ DE SANTA ANNA returned with a large army of several thousand in early 1836 to punish the Texans, Bowie was among a force of about 180 men who took up defensive positions at the Alamo, an abandoned Spanish mission in San Antonio.

Bowie became the commander of an informal volunteer militia that converged at the Alamo along with the regular Texas army. He apparently did not take well initially to the idea of being subordinate to the army's leader,

Colonel WILLIAM BARRET TRAVIS, who was much younger than Bowie. The two managed to work out a plan for joint command, but they disagreed about whether to seek a negotiated end to the conflict before the shooting started in earnest. Bowie favored doing so and sent a message to Santa Anna to that effect through a messenger. When the Mexican leader refused to consider any compromise, Travis and those in the Alamo, including Bowie, rejected any surrender. In the meantime, Bowie had become seriously ill, most likely with typhoid, and was in his sickbed when the Mexicans began their siege of the Alamo. His worsening condition left Travis to lead the beleaguered Texans. With no help coming from other Texas armies and with the Alamo now completely surrounded, the situation quickly became hopeless. The Mexicans, after a sustained artillery barrage, began to scale the walls of the mission on March 6, 1836. Bowie by this time was far too sick to join in the defense and was killed by Mexican troops in his bed as the Alamo fell. Along with Travis and DAVY CROCKETT of Tennessee, Bowie became among the most celebrated of the defenders of the Alamo, all of whom were elevated to the rank of American legends.

**Brannan, Samuel** (1819–1889) *settler, journalist*

A pioneer, printer, and merchant who became CALIFORNIA's first millionaire, Samuel Brannan was born in Saco, Maine, on March 2, 1819. In 1833 his family moved to Kirtland, Ohio, where the 14-year-old Brannan became a printer's apprentice. In the mid-1830s the founder of the CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS, JOSEPH SMITH, JR., established a Mormon settlement in Kirtland, and in 1842 Brannan converted to the faith. Soon after, he married a Mormon woman and moved to New York City to work as a church publisher. Brannan amassed a small fortune in this capacity. In 1844, however, Joseph Smith was murdered by an Illinois mob, and his successor, BRIGHAM YOUNG, ordered Brannan to collect all the Mormons in the city and emigrate from the United States.

Brannan accordingly chartered the schooner *Brooklyn* at his own expense and undertook the lengthy voyage around Cape Horn to California, then officially a Mexican territory. In July 1846 they finally dropped anchor at Yerba Buena. That port, soon renamed San Francisco, had been seized by American settlers and was now part of the United States. (California became a U.S. state in 1850.) Brannan

and his 238 Saints (Mormon faithful) nonetheless blended in with the locals, and he began an ambitious program of economic development. He quickly opened several flour mills operated by Mormons, all the while accepting tithes from them, which he invested in other business schemes. He also established some of the earliest printing presses on the West Coast and edited the newspaper *California Star*. These endeavors were quite lucrative. In 1847 Brannan visited Brigham Young in Salt Lake City, Utah, and tried to convince Young to relocate the main church to California. When this failed, Brannan determined to run Mormon affairs along the West Coast to his own benefit.

In 1848 Brannan became aware of the presence of gold in and around Sutter's Fort. Quietly buying up all adjacent territory, he stocked his stores with utensils and items that prospective gold seekers might need. Then he announced his discovery to the world. He made a fortune during the ensuing CALIFORNIA GOLD RUSH (1848–49) and continued diversifying his business interests to include office buildings, banks, a cattle ranch, and a vineyard. By 1856 Brannan was California's first millionaire, though the Mormon church ultimately excommunicated him for refusing to return church money. He nonetheless maintained high visibility in San Francisco politics, serving as head of the vigilante movement to eliminate city crime. His stridency in that role, however, led to his dismissal, and he lost heavily during a costly 1870 divorce. Thereafter Brannan took to drinking, squandered his fortune, and ended up living in poverty. He died in Escondido, California, on May 2, 1889, reputedly so poor that his body lay in the undertaker's vault for 16 months until a well-intentioned nephew paid the embalming bill. A pioneering, if slippery, entrepreneur of the California frontier, Brannan was finally laid to rest in San Diego.

**Further reading:** Will Bagley, ed., *Scoundrel: The Samuel Brannan Papers* (Spokane, Wash.: Arthur H. Clark, 1999); Newell H. Bringhurst, "Samuel Brannan and His Forgotten Final Years," *Southern California Quarterly* 72, no. 2 (1997): 139–160.

—John C. Fredriksen

**Bridger, James** (1804–1881) *trader, trapper, guide, scout, explorer*

James Bridger was one of the most famous of the celebrated MOUNTAIN MEN and a guide whose knowledge of the geography of the West made him a legend in his lifetime. He was born in Richmond, Virginia, but his family soon moved to St. Louis, Missouri. When his parents died, the 13-year-old Bridger was apprenticed to a blacksmith, but he left the trade in 1822 to accompany WILLIAM HENRY ASHLEY on

his first expedition to the Rocky Mountains. The next year, he and Thomas Fitzpatrick made the trip west overland with Major Andrew Henry. Another man on the journey was Hugh Glass, who had been severely mauled by a grizzly bear near Grand River, South Dakota. Although Henry had instructed them to care for and comfort Glass, Bridger and Fitzpatrick abandoned him in the belief he was about to die. Glass survived, and the story followed Bridger the rest of his life.

In late 1824 or early 1825 Bridger discovered the Great Salt Lake; he was probably the first American to see it. After Ashley's retirement, Bridger went to work for the company ran by JEDEDIAH STRONG SMITH and WILLIAM SUBLETTE. He was later employed by the ROCKY MOUNTAIN FUR COMPANY as a partner from 1830 until the dissolution of the company in 1834. In 1838, he signed on with the AMERICAN FUR COMPANY.

By 1843 Bridger had retired from the fur trade. With Louis Vasquez he built Fort Bridger at the Black Fork of the Green River in present-day western Wyoming. Here he offered an outfitting station for transcontinental emigrants headed to Oregon and California, with goods at high prices, fresh draft animals, and useful advice on schedules and routes. He sold his share in the fort to the CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS 10 years later. Throughout these years, he continued to be in great demand as a guide. He found and named Bridger's Pass and Cheyenne Pass in the Wasatch and the Rockies. On the outbreak of the MORMON WAR in 1856, Bridger guided Colonel Albert Sidney Johnston's federal troops to the Great Salt Lake. Two years later, he accompanied Captain William Reynolds's expedition to the Yellowstone River. Bridger also guided exploring parties over the Powder River route (1865–66) and surveyed the Bozeman Trail for the federal government. He subsequently worked with Colonel Grenville M. Dodge on a survey for the Union Pacific Railroad.

During his years in the West, Bridger married three Indian women: a Flathead, a Ute, and a Shoshone. He sent the children of these marriages to Missouri for education. In 1868, his eyesight having declined, Bridger left the employ of the Union Pacific and bought a house at Westport, Missouri, near his friends WILLIAM BENT and Louis Vasquez.

Bridger's knowledge of the western landscape was unsurpassed, and his knowledge of the Indian peoples who had lived there was almost as great. He was one of those rare western pioneer figures who lived long enough to be celebrated as an icon of the American frontier. He appeared in the reports of the many prominent military officers, explorers, and writers whom he had guided. E. C. Judson, who wrote under the pen name Ned Buntline,

wrote popular adventure stories about Bridger's career in the West. When he died in 1881, Bridger had joined that select group of western heroes who seemed to exemplify the human responses to the challenges of the frontier: uneducated but savvy, a man who could respond to every challenge from Indians to snowstorms, and who emerged with a story to tell.

### Brook Farm

Former Unitarian minister George Ripley and his followers founded this experimental farm, also known as the Brook Farm Institute of Agriculture and Education, on 200 acres of land in West Roxbury, Massachusetts, in April 1841. The farming operations were designed around the ideals of cooperative living, in which members combined manual labor and intellectual activities in an effort to regain a sense of higher calling that they felt was being destroyed by industrialization and the increasing division of labor.

At the beginning, prospective members financed the farm through a joint-stock company, with stocks selling for \$500 per share. Individual Brook farmers were supposed to devote part of each day to the manual labor necessary for agriculture and another part of the day to developing their minds and improving their souls. Artistic and social pursuits were highly valued, and the members enthusiastically participated in plays, musical performances, cardplaying, picnics, and other amusements. Several important social thinkers and artists joined this experimental farm, including Nathaniel Hawthorne, Isaac Hecker, and Charles A. Dana. The farm also attracted many prominent visitors such as MARGARET FULLER, RALPH WALDO EMERSON, William Ellery Channing, and Horace Greeley. These influential visitors spread the word about Brook Farm and its philosophy in their writings. As such, Brook Farm was an embodiment of the TRANSCENDENTAL MOVEMENT, and was also influenced by George Ripley's experiences with Unitarianism.

The farmers produced crops for subsistence and for sale, but their agricultural efforts were hampered by poor soil and inexperience. More economically successful was the Brook Farm school, which implemented the farmers' progressive ideas about learning by doing. This combination of thought and action was part of Ripley's desire to reconnect the social classes by requiring each person to engage in both manual and intellectual tasks. By requir-

ing members to participate in all aspects of farm living, the founders hoped to reach greater social harmony and personal development in society.

Influenced by the writings of French philosopher CHARLES FOURIER, the members of Brook Farm decided to convert to his phalanx model in 1844. Fourier's ideas fitted well with the original aims of Brook Farm, since he advocated the reorganization of civilization into agricultural groupings (phalanxes). These phalanxes would develop social harmony through an economic system in which people worked on the tasks for which they were most suited, shedding the confines of industrial society and cultivating their whole selves. Each phalanx would live in a community dwelling called a phalanstery. The Brook Farm phalanstery burned down in 1846, while still under construction. The fire was a major financial setback for the farm and led to its dissolution in 1847. Even though Brook Farm existed only briefly, the ideas it tried to embody continued to be influential among Transcendentalists and other social utopians. Other more successful phalanxes were founded in the United States, and Ripley's experimental farm continued on in the memories and writings of the people who participated in it.

### Burns, Anthony (1829–1862) antislavery activist

A fugitive slave whose capture and return to his owners generated controversy among northern abolitionists, Anthony Burns was born in Stafford County, Virginia, on May 31, 1829. Though denied a formal education, he learned the alphabet from playing with white children and taught himself to read and write. He subsequently converted to the Baptist faith and found fulfillment serving as a "slave preacher" to his fellow African Americans. Having injured his right hand and being no longer capable of sustained labor, Burns became convinced that deportation to the Deep South and even harsher treatment was imminent. He thereupon decided to escape and, while working as a stevedore and with the assistance of an obliging white sailor, he fled to Boston in March

(Hulton/Archive)

1854. There, on May 24, 1854, Burns was arrested at the behest of his former master under the controversial FUGITIVE SLAVE LAW of 1850. This legislation reaffirmed the status of slaves as property and mandated returning

them to their rightful owners. Failure to comply was a federal offense.

Word of Burns's arrest and impending extradition back to Virginia caused considerable unrest among Boston's abolitionist community. A mass protest was staged by WENDELL PHILLIPS outside of Faneuil Hall, and when violence broke out in an attempt to free Burns from the municipal court house, a deputy sheriff was killed. During court proceedings, Burns was represented by noted attorney RICHARD HENRY DANA, who argued strenuously but futilely for his release. The following day, the militia was called out to escort the prisoner from the court to the dock, where he was placed on a boat and shipped back to Virginia. The entire episode cost the U.S. government an estimated \$15,000 for the return of one fugitive slave.

Once back in Virginia, Burns was imprisoned for five months as punishment. During this time, he was sold by his original owner to David McDaniel, a speculator. McDaniel had been contacted by a group of Bostonians who procured \$1,500 to purchase Burns's freedom. Accordingly, in March 1855 he returned north a free man and was publicly hailed as the "Lion of Boston." Further donations allowed Burns to attend the Preparatory Department of Oberlin College, Ohio, where he formally studied theology and became a Baptist minister. He preached briefly in Indianapolis before an atmosphere of racial intolerance induced him to relocate to St. Catharines, Ontario, as pastor of the fugitive slave community. He died there in that capacity on July 27, 1862. Burns's notoriety had been brief but decisive; in the wake of his ordeal, no other fugitive slave was forcibly returned. Moreover, the entire episode added greater moral and political impetus to the rising cause of abolitionism. Eight northern states subsequently passed "personal liberty laws" to further infringe on compliance with the Fugitive Slave Law.

**Cabet, Étienne** (1788–1856) *settler, writer*

A socialist community founder, Étienne Cabet was born into a working class family in Dijon, France, in 1788. He grew up in an atmosphere suffused with the sights and sounds of the great revolution of 1789. Educated at the local lycée (school), he became a medical student, but law was his real interest. After pursuing legal studies, he was admitted to the bar and then took a doctoral degree in law. When the courts in Dijon became hostile toward his legal defense of political radicals, he moved to Paris, where he identified himself with radical causes, culminating in his support of the July Revolution of 1830. The new monarch, Louis-Philippe, appointed him procureur-general for Corsica, but his extreme views led to his recall. He then sought political office and was elected to the Chamber of Deputies, where he allied with the radical faction. In 1833, Cabet established his own newspaper, *Le Populaire*, which became a voice for the workers. The following year, he published articles that incited readers to overthrow the government. He was indicted, and in order to avoid prison, he went into exile in London for five years.

In London, Cabet wrote a utopian novel, *Voyage et Aventures de Lord William Carisdell en Icarie*. When he returned to France in 1839, he republished the volume with the title *Voyage en Icarie*. The book was an immediate sensation. Into the economic and political ferment of the 1840s, Cabet and his book spoke to a vision of a just and equitable society. In May 1847, he wrote an article that described a utopian community in the United States.

Cabet correctly sensed that the PUBLIC LAND POLICY of the United States offered opportunities for land acquisition not available elsewhere. Unfortunately, instead of dealing with the federal land system, he negotiated with a Texas land company for 1 million acres on the Red River in Texas. When the advance party of some 70 Icariens arrived at the site, they found the holdings widely scat-

tered and not especially fertile. Cabet gathered the main body of 500 adherents in New Orleans for a new start. In 1849, he leased the land and buildings of the former Mormon community at NAUVOO, Illinois. The community of Icariens settled into the new site under Cabet's leadership, and New Icaria began a six-year period of prosperity and growth.

In the midst of this success, Cabet found himself besieged by the courts in France and by a dissident faction in Nauvoo. Some of the French Icariens, irate at the failure of the Texas colony, brought suit for fraud against Cabet in French courts. The French courts supported the plaintiffs and sentenced Cabet in absentia to prison and a fine. In 1852, Cabet returned to Paris to defend himself against the judgment. Even as he achieved a degree of vindication in the French courts, the dissident faction in Nauvoo grew. In 1856, this group elected a majority to the board of directors governing the colony. Cabet challenged the legitimacy of the election, but civil authorities in the state of Illinois upheld the results of the election. Cabet then moved with 180 followers to the outskirts of St. Louis, where he suffered a stroke and died in 1856. The Icarian colonies survived him, including communities at Cheltenham, Missouri; Corning, Iowa; and Cloverdale, California.

Although French in origin and French in his views of society, the economy, and politics, Cabet's great social experiments were in the United States. As a part of his commitment to the nation that offered a refuge to himself and his followers, he became a citizen of the United States in 1854. Ridiculed in much of the French press, Cabet's communities nevertheless continued to attract adherents on a regular basis throughout the 19th century well after his death.

**Calhoun, John C.** (1782–1850) *secretary of state, secretary of war, U.S. vice president*

One of the leading senators of the first half of the 19th century as well as the most prominent ideological and political defenders of southern rights and slavery, John Caldwell Calhoun was born on March 18, 1782, in what is now Abbeville, South Carolina. The Calhouns were a prominent slave-owning family of Scotch-Irish ancestry. John Calhoun was named for his uncle, John Caldwell, his mother's brother, who was killed by Tories during the intense civil struggle that marked the American Revolution in the Carolinas. His father, Patrick Calhoun, rose to political prominence, and as a member of the South Carolina legislature he opposed the federal Constitution during the 1780s.

Young John Calhoun attended school in Georgia, where he studied history and philosophy, including the works of the English political thinker John Locke. After graduating from Yale College with a strong academic record, he enrolled at the well-known law school in Litchfield, Connecticut, run by Tapping Reeve. In both New England

schools, Calhoun was a rare Republican, and, unlike his classmates, he exhibited little interest in formal religion. After completing his legal education, Calhoun returned to South Carolina, where he opened a law office in Abbeville and quickly gained a reputation for sharp thinking and honesty. He soon turned to politics, making his inaugural speech a defense of American national honor as he lambasted Britain for its navy's attack on the U.S. ship *Chesapeake* in 1807.

Shortly after his political debut, Calhoun won election to the South Carolina legislature in 1808 at the age of 26. While serving there, the legislature devised a plan to share power between the lowland section of the state, ruled by large slave-owning planters and merchants, and upcountry, which was home to yeoman farmers. Each section of the state was effectively given control over one house of the legislature when it reapportioned its seats. This was Calhoun's first experience with the idea of the "concurrent majorities," by which two competing interests would each be equally represented within one government.

John C. Calhoun's service in the South Carolina legislature was brief. Following his first term, he was elected to the U.S. Congress as a Republican. Around the time of his election, Calhoun married his distant cousin Floride Bonneau Calhoun, who was 11 years younger than he and a member of a prominent Charleston family of French Huguenot, or Protestant, ancestry. The couple had 10 children, seven of whom survived until adulthood. The marriage served to advance Calhoun's political status in South Carolina.

Upon his arrival in Washington, Calhoun and the rest of Congress were faced with a growing crisis with Britain and the likelihood of a second war with that country. Calhoun and a group of young congressmen, mainly from the South and West, emerged as fierce advocates of defending national pride and were named the WAR HAWKS for their exuberance. Although a newcomer to Washington and to Congress, Calhoun was named chairman of the House Foreign Relations Committee, and it was his committee that passed a key resolution calling for war with Britain. Once the WAR OF 1812 had commenced, Calhoun was active in organizing and sustaining logistical and financial support for the war. The pace and scope of his actions were such that one observer of wartime Washington described him as "the young Hercules who carried the war on his shoulders."

Once the war had ended, Calhoun resumed his fervent and strengthened nationalism in Congress; he was instrumental, for example, in chartering the SECOND BANK OF THE UNITED STATES in 1816. He also advocated federal support for internal improvements and for a high tariff to protect American goods from foreign competition. Calhoun also spoke for the need for a standing federal army, even in peacetime, as well as for strengthening the navy.

John C. Calhoun (Library of Congress)

He dismissed objections to nationalist measures that were based on sectional interests and on what he called “refined arguments on the constitution.”

Calhoun’s nationalism, which was forged in the War of 1812, would not ultimately govern the rest of his career. He did, however, resign his seat in Congress to join the cabinet of President JAMES MONROE as secretary of war. He served with distinction in that office, although his mind had more of a philosophical bent than an administrative one.

In 1824 Calhoun briefly entered the presidential contest to succeed the retiring Monroe. Unable to garner enough support for the presidency, he accepted the Republican nomination for vice president and assumed that office when JOHN QUINCY ADAMS became president. Although part of the Adams administration, Calhoun soon forged a political alliance with ANDREW JACKSON and New Yorker MARTIN VAN BUREN. They and others began building support for Jackson’s 1828 White House bid almost immediately after Adams took office. This tactical decision by Calhoun did not mean that he had abandoned his own presidential ambitions. His hope was to succeed Jackson after the aging general served one term in the White House.

It was during his years as vice president that Calhoun started to modify his unqualified nationalism. Southerners came to despise the high tariffs designed to protect New England manufacturing interests, which they believed artificially raised their agricultural costs. South Carolina took the lead in opposing what its political leaders in the 1820s referred to as the “Tariff of Abominations.” In his trips back home to his native state, Calhoun could not but notice how the deep feeling of resentment toward the North was based not only on the tariff but on a more general and wide-ranging critique of the nation’s federal system. Calhoun for his part agreed to write a political treatise in which he insisted that South Carolina had the right to nullify any national law it determined was contrary to its own interests. He further argued that the federal union was made by the states, and they remained the sovereign body within it. The Constitution itself was fundamentally an agreement, or compact between the states, and the federal government was their instrument. Hence, Calhoun took a crucial step away from his nationalism and began to embrace fully the doctrine of states’ rights. His newfound sectionalism helped to end any hopes that he had of succeeding Jackson. Calhoun resigned the vice presidency in 1832 and was subsequently elected to the U.S. Senate from South Carolina.

The dispute between South Carolina and the federal government over the tariff issue came to a head in 1833. At one point, President Jackson threatened to lead an army into South Carolina and hang John Calhoun. Hoping to avoid a crisis, Calhoun helped to forge a compromise on the tariff. But in the wake of Nat Turner’s rebellion in

Virginia and as abolitionism burgeoned in the North, Calhoun emerged as the leading spokesman for the cause of southern rights. A slaveholder and confirmed believer in white superiority, Calhoun began a vigorous defense of SLAVERY, which covered the final two decades of his life, on a range of political, economic, philosophical and moral grounds. He asserted that the rights of slaveholding states must should be protected within a nation that was increasingly dominated by the North and its manufacturing- and wage-based economy. One way to do so, Calhoun argued, was by a concurrent majority, a concept he had originally encountered in the South Carolina legislature.

Calhoun’s antiabolitionist activity included supporting the “Gag Rule” by which Congress refused to even consider antislavery petitions; he also strongly favored the right of southern postmasters to remove abolitionist literature from the mail. Calhoun served briefly as secretary of state under President JOHN TYLER, and in that post he enthusiastically supported the U.S. annexation of TEXAS and argued for adding more slave states to the Union. Upon his return to the Senate in 1845, however, he came to oppose the MEXICAN-AMERICAN WAR, in the belief that the incorporation of so much new territory into the United States would push the question of slavery once again to the forefront and threaten the Union. Unfortunately, Calhoun was right in that fear; Congress soon found itself debating a proposal to ban slavery in all lands that the United States would gain in the war with Mexico. Calhoun stepped forward once more to defend the interests of the South, arguing that the addition of the free states of Oregon and CALIFORNIA would tip the balance of power against the South and cripple its ability to protect slavery from abolitionists.

The culmination of Calhoun’s thinking on this subject came in his two essays, “The Disquisition on Government” and “Discourse on the Constitution.” In them, he once again spelled out the need for southern interests, unique as they were, to be guaranteed with special safeguards or else the continuation of the Union would not be possible. He repeated his view that the American political system was uniquely federal, not national, with ultimate sovereignty residing not with the federal government but rather with the people of the states. He went so far as to propose that the North and South would each elect its own president, and the consent of both would be needed to enact legislation into law.

In his final year of life, Calhoun remained opposed to compromise over the question of the territory acquired from Mexico. Sick and rapidly failing, he sat by in the Senate while a colleague read his final speech on March 4, 1850, in which he traced the change of the United States from a federal republic to a “consolidated democracy” increasingly dominated by the North. The South, meaning its slaveholders, would have no way to protect their rights

and interests in such a transformed polity. Having offered little hope for saving the Union, he died on March 31, 1850, and was buried in Charleston, South Carolina. The COMPROMISE OF 1850 staved off civil war for another decade, but John C. Calhoun had already laid the intellectual foundation for the doctrine of states' rights and of secession itself.

## California

The original human inhabitants of what was to become California were Indians who had crossed the bridge from Asia to northern North America some 15,000 years ago. As Indian peoples spread across the continent, south and then east, they extended human habitation across the range of South and North America. Amidst this movement over generations and centuries, large numbers remained clustered in what would become California. The pleasant climate and the varieties of accessible foods—fish, game, and seeds especially—made the place attractive for permanent settlement. As the natural resources were so extensive, California Indians had little reason to make a transition to agriculture, and they remained hunters, fishers, and gatherers. They were also diverse in their cultures, with the northern Modoc and Shasta connected culturally to the nations of the Pacific Northwest, the Miwok in the central valleys, the several nations of the south, and the Mojave and Yuma in the eastern deserts. These varied groups were sedentary and generally peaceful. The plentiful natural resources and mild climate had reduced the friction associated with expansion in search of food sources.

The ships of several European nations had passed up and down the California coastline for 200 years before European settlement began. Spanish explorers landed and spied out Alta California (the name given to Upper California by the Spanish) as early as the 1540s. In spite of its physical appeal, California did not fit easily into the Spanish empire. There was no readily exploitable source of wealth, and the ocean currents and winds made it difficult to sail up the coast from Mexico.

Among those in the first expedition who established a permanent Spanish settlement in San Diego in 1769 was Father Junípero Serra, who would found many of Alta California's missions. Spain's resources for expansion were declining, and given the great distances in Upper California, it was the missions that became the centers of Spanish settlement. Ultimately, there were 21 missions

established on important sites. The missions established effective agricultural enterprise aided by the attractive weather and fertile soil, but they were far less successful in bringing together large numbers of Indians on a voluntary basis. Instead, missionaries frequently enslaved the Indians to establish an agricultural labor system and keep it in place. Partly because of this failure and partly because of the pleasant life they enjoyed, the padres made no effort to secularize the missions and deliver them into Indian hands after a period of years. It should also be noted that the important sites and lands in Alta California were in the hands of the church rather than secular entrepreneurs, and the missionaries hoped to isolate the Indians on the missions from what they regarded as dangerous temptations of the secular world.

In 1821 Mexico revolted against Spanish imperial rule and established its independence, upon which Alta California became a state in the Republic of Mexico. As the new Mexican republic worked to establish its authority over an enormous area with a diverse population, the state of California came to exercise a high degree of independence. The appointed governors resident in Monterey were a long way from Mexico City, and the authority of the republic was weak at such a distance.

The new republic felt strongly about one aspect of life in California. In the aftermath of the revolution of 1821, the federal government of the Mexican republic turned its attention to the missions of California, which it thought exploited the Native peoples. After extended deliberations, the missions were secularized. Unhappily, the Indians themselves did not benefit from the secularization process; instead, the fertile mission lands were appropriated by large ranchos that were to spread across much of southern and central California following independence from Spain.

After 1821 the new government of Mexico also set up plans to develop the nation's northern provinces. The new settlements would protect the distant reaches of the new, independent nation from the incursions of the Russians from the North or the Anglo-Americans from the East. Spain had used the missions to establish its nominal control; Mexico turned to independent ranchos in the hands of individual families. It was a solution to the problem appropriate to the new nation: secularization mixed with private land ownership. The spread of the rancho system was also natural because the experiences of the missions over two generations had demonstrated that California was an ideal climate and landscape for the pastoral industry.

The federal government in Mexico City now made a number of large grants to individuals. In 1820, there were perhaps 20 sizable private land holdings in Upper California; in 1840, there were 600 such tracts. Most of these new land grants were very large, up to several thousand acres. Ranchos became distinct and separate independent politi-

cal, economic, and social units. They were run by families as private fiefs with total control over every aspect of life. Much of the work was done by former mission Indians, now laboring under conditions of debt peonage, or an economic situation close to permanent slavery. This semiféudal system did not owe allegiance to any central government, and other than making further land grants, the government in Mexico City exercised little influence or sovereignty in California, where the dominant influence had become that of the local ranchos.

As the pastoral industry of livestock grazing took hold on a large scale and soon prospered, the ranchos became, inevitably, involved in trade with the outside world. The traders turned out to be New England sea captains and their ships, which began to make regular stops at sites along the California coast to pick up cargoes of cattle hides and tallow. The classic description of this trade is depicted in RICHARD HENRY DANA's *Two Years Before the Mast*. Over a period of 20 years after independence, the strongest influence in Alta California was not the federal government in Mexico City but the resident trade representatives established by New England merchant companies in the port towns of California. By the 1840s, there were many such agents, of whom the most significant was THOMAS OLIVER LARKIN. Seagoing commerce made the California ranchos wealthy, and the dependence of the ranchos on trade made the agents of trading companies enormously influential. This relationship was the beginning of a widening American influence in California affairs.

The numbers of Euro-American peoples involved remained small. In 1845, after a quarter-century of Mexican independence and on the eve of war between Mexico and the United States, the non-Indian population of California was probably on the order of 7,000. American immigration overland had begun on what would become the CALIFORNIA TRAIL, a branch of the OREGON TRAIL. Perhaps as many as several hundred people a year were arriving in California after a transcontinental journey.

In 1846, as relations between the United States and Mexico worsened, a group of itinerant hunters and trappers organized a rebellion against Mexican rule in California with a view to its annexation to the United States. Known as the BEAR FLAG REVOLT, this miscellaneous force was led by JOHN C. FRÉMONT. However, their ineffectual but sometimes violent actions were overtaken by larger events.

The outbreak of the MEXICAN-AMERICAN WAR in May 1846 changed the direction of California's history. The harbor at San Francisco Bay was considered the most important naval anchorage on the West Coast, and California had always played a central role in American expansionist plans. As part of military operations, General STEPHEN WATTS KEARNY's army reached California in December 1846.

Kearny and Commodore ROBERT FIELD STOCKTON, in command of American naval forces, defeated the Mexican army at Los Angeles on January 8, 1847, and on March 1, Kearny established an American civil government in California. At the TREATY OF GUADALUPE HIDALGO, signed on February 2, 1848, Mexico ceded to the United States one-third of her northern national territory, including California.

Even before the signatures had been affixed to the treaty, the U.S. plans for California were overtaken by an unforeseen event. On January 24, 1848, at the site of JOHN SUTTER's mill in Coloma on the American River, a carpenter named James W. Marshall discovered gold. The ensuing immigration from around the world, known as the CALIFORNIA GOLD RUSH, would change the face of California and shape its development for the next half-century. By 1850, the census of California showed nearly 100,000 people, almost all of them arrived in the previous year. This influx of humanity would submerge the Mexican population of California, call into question many of the land grants made by the Mexican government, and quickly make California an American area. The constitution drafted at Monterey in the autumn of 1850 prohibited slavery, in large part because of the fear on the part of miners that slaves would become competition for free miners. Congress conferred statehood in 1850, as part of a settlement of territorial acquisitions from the Mexican-American War known as the COMPROMISE OF 1850.

California grew rapidly in the 1850s as mining expanded and prospered; AGRICULTURE developed on the fertile soil, tended by a burgeoning population; and San Francisco became the leading metropolitan center on the West Coast, with a population that became the most cosmopolitan in the nation. To the waves of Americans who came across the continent in 1849 and 1850—and in subsequent years by sea—were added large numbers of Mexicans, Chileans, Peruvians, and Hawaiians; from Europe, Germans, English, and French; and finally Australians and Chinese. All were subject to a growing unhappiness with the influx of foreigners, and in response to such sentiments, the legislature passed a heavy tax of \$20 a month against foreign miners in 1850. After extensive protests, the tax was reduced in 1851 to \$4 a month.

Of these groups, the Chinese would become the most visible feature of life in California. Arriving in large numbers for the first time in 1852, they had come in response to the lure of "Gold Mountain," the opportunity associated with the gold rush for poor men without name or education to make a fortune. The Chinese came, for the most part, as contract laborers, and of all the immigrant groups, they were the most distinctive. As the economic opportunities associated with the gold rush waned, they became the universal victims of the rising discontent against newcomers.

Indians were also targets of violence. Isolated raids against itinerant miners in the mountains were met with massive reprisals. The state government promulgated an official policy under which Indians were to be hunted down as dangerous to civil order. The Indian population in California was decimated within a decade of the opening of the gold rush.

By 1860, on the eve of the Civil War, California had completed a decade of extraordinary growth. Agriculture had begun to take hold in the central valleys. The towns of Sacramento and Stockton were growing as commercial centers. Yet it was also a time of uneasiness and civil disorder. In response to a rising level of crime and violence, “committees of vigilance” took power in San Francisco in 1851 and 1856, enforcing justice through extra-legal means. In the latter year, a private army controlled the city for three months, and several notorious characters were hung. Nevertheless, despite its uneasiness and violence, San Francisco emerged as a financial center of the West Coast as well as a cosmopolitan center of theater, literature, and journalism. In 1859, for example, San Francisco had 12 daily newspapers. They all paid tribute to the fastest-growing city in the rapidly growing Golden State.

**Further reading:** Walton Bean, *California: An Interpretive History* (New York: McGraw-Hill, 1973); Andrew F. Rolle, *California: A History* (New York: Crowell, 1969); Kevin Starr, *Americans and the California Dream, 1850-1915* (New York: Oxford University Press, 1986).

### California gold rush

The California gold rush was the mass movement of men and women to California in response to the discovery of gold by James W. Marshall, a carpenter, who found nuggets at JOHN SUTTER’s mill on January 24, 1848. Although Marshall and his employer Sutter tried to keep the news quiet, rumors spread quickly. First arrivals came from along the West Coast, from Sonora and Oregon, and from the HAWAIIAN ISLANDS. The news then spread to the eastern states, from Maine to Mississippi, Wisconsin to Florida, and finally around the world. In response to the news of gold that was available to everyone, Americans initially set forth by sea as early as the winter of 1848–49, some on voyages of 8–10 months around Cape Horn; others took a shorter route to Panama, where they crossed the isthmus and then sought a ship to take them up the coast to San Francisco. Overland emigration began in the spring of 1849 from Independence and St. Joseph, by way of the CALIFORNIA TRAIL. The appeal of gold in California turned out to be universal. Those who would become known as the FORTY-NINERS came from farms, small towns, and large cities, with representatives of every class, from the wealthy

to those in average circumstances and from every state and territory, including slaves brought by their owners to the goldfields.

The prospect of the wealth opened by news of the dazzling discoveries at Sutter’s mill offered young people escape from what they thought of as the limited horizons of the village, the farm, or the shop, and the daily demand of labor associated with these places. It was not the young alone, however, who were spurred into action. Men of all ages and conditions made plans to go to California, and a surprising number of women wished to join them.

The response to the California gold discoveries was the greatest westward migration in the history of the nation. Some 80,000 went to California in 1849 and probably 300,000 by 1854. It was an immigration that was made by land across half a continent and by sea over thousands of miles of ocean to new and heretofore unimagined adventure and wealth. In the end, the California gold rush drew people from all over the world, including peasants from China and lawyers from Paris, miners from Wales and merchants from Chile. California would become in a few short years the most cosmopolitan place in the world, and San Francisco the most cosmopolitan city.

Astonishing as it might seem (and did to the Americans at the time) in a world of rumor and exaggeration, the stories of riches in California were true. The Golden State—it would join in Union in 1850—produced a seemingly endless flood of gold. While agricultural laborers in the East earned a dollar a day for 12 hours of work in the fields, and artisans and craftsmen received perhaps a dollar and a half for the same hours, men who were recently farmers and mechanics made \$16 and even \$20 a day washing gravel in the streambeds of California’s foothills. In the six years from 1849 to 1855, the argonauts (as they were sometimes called) harvested some \$300 million in gold from California.

The other astonishing feature of the California gold rush was that gold was available to everyone. This greatest bonanza in the history of the young republic and newly crowned continental nation was open to all, regardless of wealth, social standing, education, or family name. No experience was necessary, mining skills could be learned in 15 minutes, and the only tools necessary were a pick, pan, and a shovel, at least in the early years.

Those who went to California overland in 1849 and subsequent years often did so with their friends and neighbors, joining together in what they called a company. This was a group of people who shared the duties of work on the trail and looked after one another—in other words, a support network. As the young and inexperienced argonauts confronted an unknown adventure involving great distances and a strange and alien landscape, such a network was both welcome and necessary.

Gold mining in California (Hulton/Archive)

The first companies went by ship or by wagon overland from St. Joseph or Independence, Missouri, to Placerville (or Hangtown, as the argonauts affectionately referred to it). By 1852, the newest victims of gold mania—and it seemed to produce annual outbreaks in different parts of the nation—were traveling by railroad to steamships and then by sea to the golden shores of California in a fraction of the time taken by their predecessors in the first great overland emigration only three years earlier.

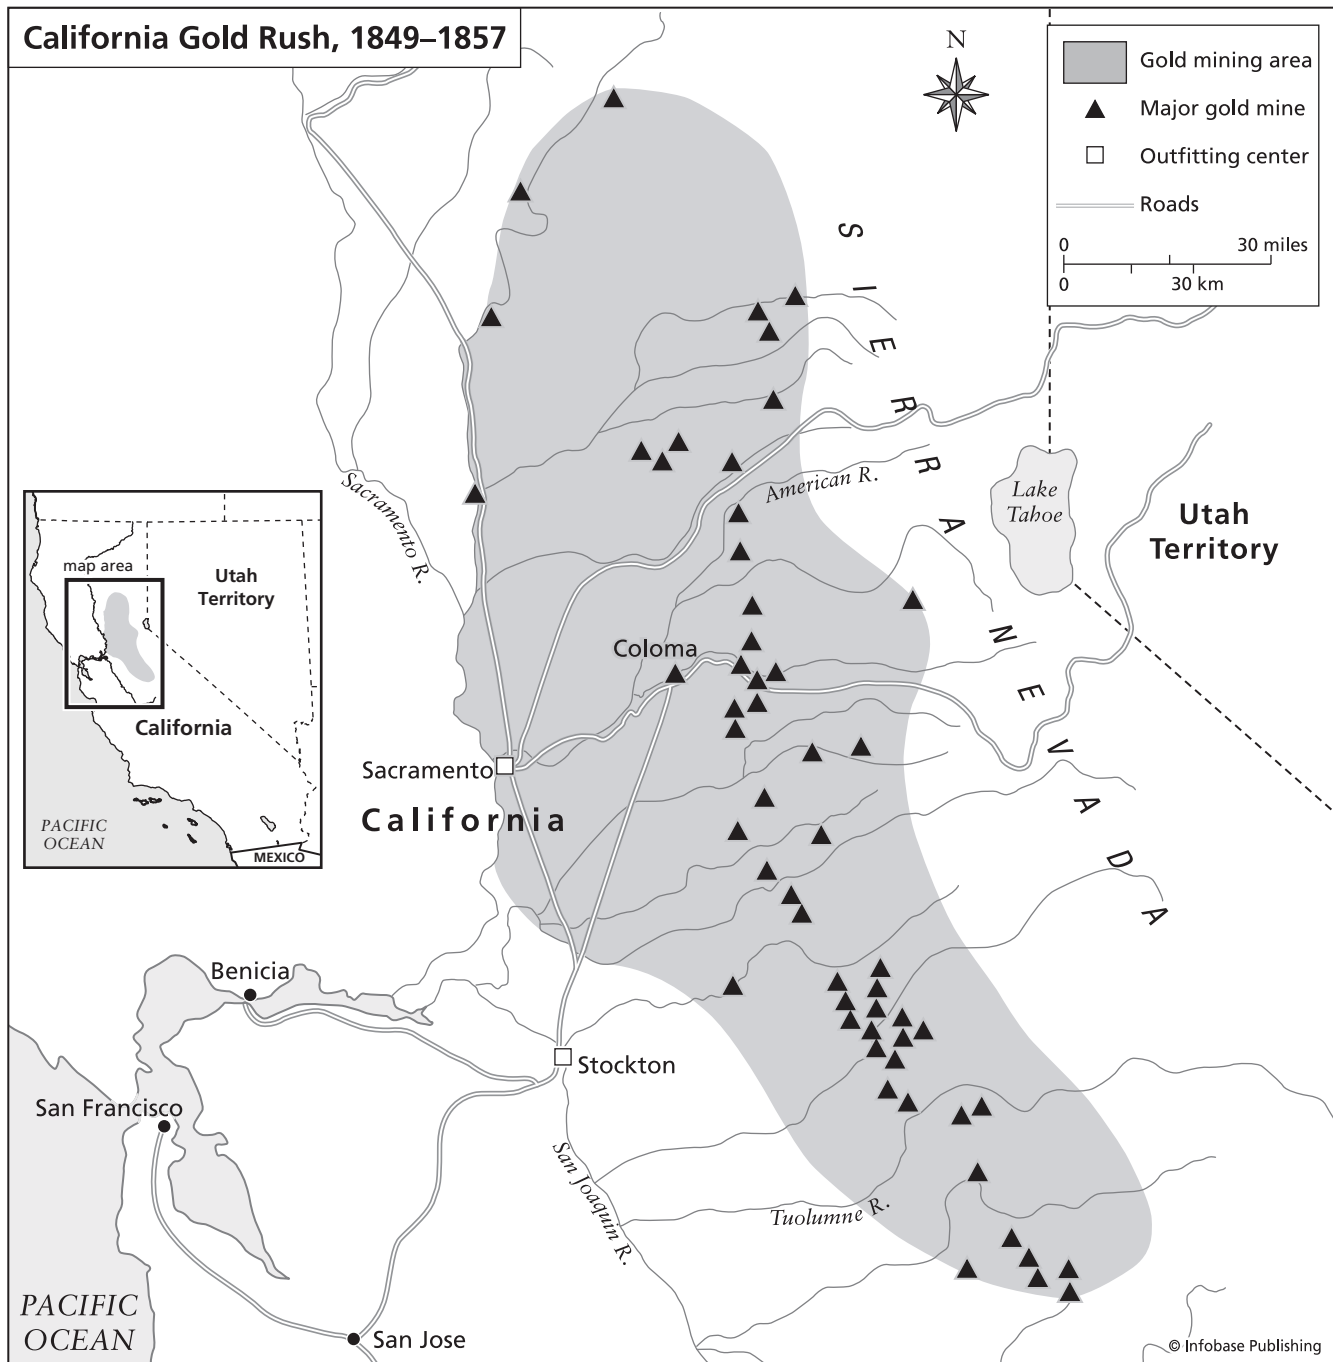

Once arrived in California, whether by land or by sea, the Forty-niners reassembled once more in groups for living and working. They called these groups mining companies or messes, after the domestic duties that were as much a part of their lives as the work in the rushing streams of the mountains. It was one of the unexpected characteristics of the California gold rush that mining, viewed as a lonely and selfish enterprise, was in reality an intensely cooperative experience.

With his new companions, the average Forty-niner established a new set of economic and social bonds. As early as the summer and fall of 1848, the first observers in the goldfields commented on the advantage of working in groups of at least three or four. These divisions for mining, with its unending hard physical labor, long hours,

and collective work, also helped to develop the new living arrangements. For the argonauts, it was cheaper and more practical to live in groups. As few as three men, but often from six to eight, would occupy a large tent or cabin, where they would take turns cooking, cleaning, and making trips to town for food and mail.

The mining company as a unit of work and living offered support in case of sickness and even death. The Forty-niner's companions would sit up with an ill miner, fetch the doctor, and arrange the burial. They would settle the estate, and they would write to the dead man's family and carry out his last wishes.

The work of mining was arduous, repetitive, and took place under difficult physical conditions. Gold mining in California at mid-century—called placer mining—was among the most onerous work performed by free labor anywhere. Working a claim was a continuous round of digging, shoveling, carrying, and washing that continued unabated and with little variation throughout the day from sunrise to sunset. For many members of the company or mess, the work was carried out in swift, ice-cold, moving water up to their knees. Overhead was the burning summer California sun that shone into the canyons and watercourses. The summer months were crucial for digging and washing, for

the dry season meant a drop in the water level, exposing the bars and riffles with the richest dirt. So hot were the days that even during the best mining season, the company often rested during the heat of the day. Placer mining was repetitive and exhausting.

When the miners had finished a day's work, they returned to the cabin and a round of chores. The domestic duties associated with the goldfields were as necessary and

repetitive as the search for gold itself. They included cooking, serving, and fetching firewood and water, all rotated on a weekly basis. For those who preferred to live alone, there were boardinghouses, complete with meals. Miners also washed and mended their clothes. Although cleanliness does not seem to have been a high priority, mending had a certain practical aspect, saving the cost of expensive new clothing.

The domestic dimension of the gold rush reflected the powerful influence of women, who dominated aspects of life in California by their absence rather than their presence. With the mining counties 97% male, the gold rush was also a continuing search for a scarce and valuable commodity—women, who turned out to be, for some years, even rarer than gold. The Forty-niners came from a world in which they had taken the presence of women for granted, but in California the argonauts confronted for the first time the prospect of a society without women, and they struggled to make the adjustment.

The growth of numbers in the goldfields was explosive. At the end of 1848, observers estimated there were 5,000 miners in California; 50,000 at the end of 1849; 100,000 at the close of 1850 and 125,000 miners in subsequent years. These numbers produced great returns, although unevenly spread across the range of mining and miners. Such astonishing numbers of miners generated new markets for goods and services. Every crossroads and mining camp of any size had a store, and towns had three or four or more. Miners took Sunday as a day off and went into town, so the entertainment business flourished, especially gambling. San Francisco became a thriving port of entry for people and goods, and the volume of commerce demanded a growing transportation network of wagons, animals, and facilities to care for them. Saloons, eateries, and boardinghouses sprang up everywhere in the goldfields, and they flourished.

The annual immigrations of new argonauts continued throughout the 1850s. As new Forty-niners arrived, others went home. The patterns of movement to and from the goldfields were continuous. Mining gradually changed, becoming less and less the work of individuals or even mining companies. First, large groups of miners joined together to build a dam to divert the flow of a stream, with a view to mining the streambed. This technique, known as river mining, demanded large numbers of miners and a substantial capital investment for a major construction project. River mining was soon followed by quartz mining, digging shafts into the sides of hills to follow seams of gold; and then hydraulic mining, in which a powerful stream of water would be used to wash away a hillside and produce gravels that could be processed for gold. All these techniques needed capital investment, and mining entrepreneurs soon began to sell stock in such ventures to the public.

From the first primitive venture, mining changed the landscape, and with larger numbers and larger-scale techniques, the changes created devastation. Beyond the physical reconfiguration of the streams and rivers of central California were the endless signs of indifferent human habitation. Old camps and mining sites marked the passage of tens of thousands and eventually hundreds of thousands through

the California landscape. The common quality that bound all these individuals over a generation was that they had come to get rich, and since they intended to stay the briefest possible time, they were not interested in the devastation wreaked on the countryside. Most miners were not purposefully destructive; they were simply intent on wealth.

The California gold rush also had a catastrophic impact on the Indian peoples of California. Driven from the meadows and streams that had provided their places of habitation for centuries, they retreated to the isolation of the high mountains. But no matter how remote the location, prospecting parties of miners would invade their habitats. As their economic condition worsened, the Indians raided mining camps in search of food. Their incursions were met with organized violence by large numbers. Miners and others reacted with a rage born of uneasiness and racial superiority. They organized expeditions into the distant Indian sanctuaries, especially in the winter when miners were idle. These expeditions were often undertaken as official acts of the state government. The violence, in conjunction with a legalized form of indentured service, reduced the Indian population from 250,000 to 15,000 between 1850 and 1900. This was among the most calamitous outcomes of any Indian group from first contact with Euro-Americans.

By the end of the 1850s, gold production in California had stabilized at about \$40 million annually. Agriculture had become increasingly significant for the Golden State, especially the development of wheat and grazing in the Central Valley, while San Francisco had made the transition from mining town to a cosmopolitan city. Yet the influences of the California gold rush were everywhere. The discovery of gold had affected the history of California and its peoples (including Mexican and Indian peoples) in dramatic and sometimes final ways.

### California missions

As early as 1542 Spanish explorer Juan Rodriguez Cabrillo (ca. 1500–1543) had reached and explored the coast of CALIFORNIA, while in 1702 the Jesuit cartographer Father Eusebio Kino had concluded that the region was not an island, but rather part of a continental landmass. Nonetheless, two centuries lapsed before any concerted attempts at colonization arose. When they did, California

missions were established by Spain as a way of extending its imperial authority. By the middle of the 18th century, Spain's resources had become strained, and the far northern boundaries of the empire needed to be extended and safeguarded against incursion by European rivals, particularly the Russians and English, who were pressing in from the north and east, respectively. Committed missionaries became the means to this end. That the mission enterprises saved the souls of heathen Indian peoples also fitted in with Spain's goals for New Spain in the Western Hemisphere. The missions left an indelible imprint on this part of the American West in terms of culture, religion, language, and architecture.

The extension of missions into California began in 1769 with an expedition to Alta (Upper) California, led by Gaspar de Portolá and Father Junípero Serra, that established a Spanish outpost and mission at San Diego. Over the next 20 years, Father Serra and other missionaries established a total of 21 missions—Father Serra personally founded nine—within Upper California, stretching from San Diego to Sonoma, including sites at Santa Barbara, Santa Clara, San Carlos (Carmel), San Jose, San Francisco, and San Luis Obispo. Missions were established at strategic points, especially those on the ocean, and they were about 30 miles apart (a day's ride on horseback). As such they anticipated an elaborate and interlocking chain of garrisons, towns, and missions all interconnected by a dirt path graced by the official name of *El Camino Real*, "the royal road."

The mission in California was a self-contained economic, social, and religious unit. The padres would gather Indian peoples into the mission and give them religious instruction and have them labor to establish a self-sufficient agricultural enterprise. Those who refused to leave were generally rounded up by soldiers and forcibly relocated to the sites. The religious instruction would lead to conversion and the saving of souls; the work would provide systematic discipline that would lead the Indian peoples toward European values; the success of the mission as agricultural enterprise would attract other Indian peoples; the mission system would serve the Spanish imperial policies at little or no cost to the Crown. In this manner, the unwilling Indians were forced to take up agriculture but were also exposed to marketable skills such as weaving, blacksmithing, tanning, and candle making. Through these expedients the Spanish hoped to convert the indigenous population from a subsistence existence into self-sustaining and loyal subjects of Spain. Missions, and their attendant presidios, thus became standard settlements of the Spanish frontier and functioned as self-sustaining outposts of the empire.

That the missions generally succeeded and even flourished owed much to the attractive landscape and gentle climate of California, but the presence of Indians was

increasingly involuntary. The missionaries thought physical compulsion to remain was necessary to save souls and to ensure the continuing success of the enterprise. Many Indians sought the missions as places of safety from the raids of other Native peoples, but when they wished to leave, they were restrained. Those who did leave the missions were pursued, returned to the mission, and punished. Although individual missions had devoted Native resident families, the system was characterized by intimidation and force, policies that kept the Indian presence in the missions at a fixed number. Dissent was not tolerated. The punishments inflicted, while identical to those meted out to the lower social orders in Spain, were harsh, even draconian. The missions continued to prosper economically, but the relationship of Native peoples to the missionary system often remained an uneasy one, and as a result, the padres' work of religious and cultural conversion was not very successful.

As the missions became established and prospered economically, the entire system became embroiled in larger church and national issues. According to the directive conveyed from New Spain, the missionaries were to establish the missions, give the Native peoples religious instruction, train them in the management of agricultural or grazing enterprises, and then hand the mission over to them, depart, and establish another mission elsewhere. However, the padres did not make plans for the secularization of the missions, arguing instead that the Indians were not ready to take over the economic initiatives. The issue resonated in Spain itself, where clergy and state clashed over greater freedom of popular expression. Furthermore, wars of liberation and independence had begun in the Spanish colonies in the early years of the century, uprisings that gathered momentum with Napoleon's invasion of Spain. In this period of confusion, the church appeared as a conservative bulwark against change. The missions were a symbol of the traditional values of church and Crown.

Although the mission was an important instrument of imperial expansion for the Spanish, expanding the area of their control without colonization, in many respects, the missions were a failure. They systematically destroyed autonomous Indian cultures, and the effects of disease and malnutrition may be seen in the dramatic decline of California's Indian peoples, from about 150,000 in 1500 to some 98,000 in 1832.

With the independence of Mexico in 1821, the new Republic of Mexico assumed sovereignty over California and its missions. The Mexican government pressed forward the issue of secularization of the missions. The reasons for promoting secularization were the long apprenticeship of the Indians and their readiness for such a step as well as the knowledge that the Catholic Church was generally a conservative influence against the revolution and the

independence of Mexico. This was undertaken with considerable delicacy, however, to avoid offending the still influential Franciscans or disrupting the economic viability of their missions, which were among the more robust in all of California. A law providing for the secularization of the missions was enacted in 1834, but its impact was mixed. The government in Mexico City was far from California and only able to enforce its will sporadically. Furthermore, the padres were reluctant to leave and the growing rancho system in California seized the mission lands as soon as secularization took place. In the end, the Indian peoples of the missions were driven into the hills or enrolled as laborers under a form of debt peonage. The missions themselves were allowed to fall into an advanced state of decay and ruin, although the descendants of their original inhabitants still carry on today as part of 28 small reservations dotting Southern California.

## California Trail

The trail that carried immigrants from Independence, Missouri, and St. Joseph, Missouri, to CALIFORNIA, was heavily used between 1849 and 1860 by FORTY-NINERS on their way to the California goldfields. The early section of the California Trail was the original OREGON TRAIL. It ran from the Missouri outfitting towns of Independence and St. Joseph north to the Platte River, west along the Platte, and then across SOUTH PASS. From this point, the trail moved along the Snake River until it struck out across the Blue Mountains to the Columbia River Valley.

The difficulty with travel to California lay in the landscape imposed by the wide and sterile intermontane plateaus, leading to the abrupt barrier of the Sierra Nevada, with its high passes and 14,000-foot peaks. Because of these obstacles, access to California in the 1830s was mainly by sea. Here, on the western coast, the trading ships of New England maintained a lively seagoing trade in hides and tallow, as depicted by RICHARD HENRY DANA in *Two Years Before the Mast*. Fur traders were the first Americans to

make overland expeditions to Mexican California, and JEDEDIAH STRONG SMITH led a party of trappers across the Sierra Nevada in 1827. Although there were other groups that crossed in the next decade, no reliable route for immigrants could be found across the mountains.

In 1841 an immigrant party led by JOHN BIDWELL left the Oregon Trail in Idaho and followed the Humboldt River across the Carson Sink to the Walker River, which they followed across the sierra to the headwaters of the Stanislaus in California. They were the first to travel a large part of what would become known as the California Trail. Bidwell's party was composed almost entirely of young men (there was one woman and child), but it was the first group of overland immigrants (as opposed to trappers and traders) to make the journey. In 1844 the first overland party with wagons made the crossing. The necessary variation was the route of the Truckee River, which was to become the route of access by trail, and later by railroad and highway. The next season of immigration, 1845, was noteworthy for the increase in numbers to a half dozen parties with perhaps 250 immigrants, among whom was JOHN C. FRÉMONT. Remembering the surge of American immigrants to TEXAS that led to the TEXAS REVOLUTION, officials in Mexican California were suspicious of the rising number of American immigrants. Nevertheless, JOHN SUTTER offered a warm welcome at his large estate in the valley of the Sacramento River. For the immigrants on the trail, Sutter's New Helvetia was the end of their long journey.

The outbreak of the MEXICAN-AMERICAN WAR in spring 1846 changed the dynamics of immigration to California. By summer of that year, American troops and naval contingents had taken possession of much of strategic California—the main towns and the coastal harbors—and immigrants were coming to what was assumed would shortly become an American possession. Perhaps as many as 1,500 men, women, and children followed the California Trail that year, of which the most famous would be the DONNER PARTY (who left in 1846; survivors reached California in 1847).

The discovery of gold in California in January 1848 led to a dramatic rise in numbers using the California Trail. In 1849, the first big season of overland immigration, perhaps 80,000 Forty-niners crowded the trail from May to the end of September. The demands of the overland trail itself were basic and uncompromising. Over the 2,000 miles from Independence or St. Joseph in Missouri to Placerville, California, the immigrant gold-seeker moved into a landscape that was progressively drier and higher. The first landmark was FORT LARAMIE in Wyoming, some 800 miles out. Here, the Forty-niner companies would resupply, repack, trade tired mules or oxen for fresh draft animals, send mail, trade stories, and sign the register. Most of them did not tarry long. The overlanders of 1849 and subsequent years thought of the search for gold as an intensely

competitive business. The advantage would go to those who arrived first and worked hardest. So they soon departed Fort Laramie, repacked and reenergized, following the Sweetwater River to South Pass. From this almost level crossing of the Continental Divide, they moved to Fort Hall on the Snake River, a second major stop for rest and supplies.

Leaving Fort Hall, the California Trail offered two options. The first ran through Salt Lake City, where the companies of argonauts entered Utah and BRIGHAM YOUNG's Mormon Church empire. Alternatively, the immigrant train might head overland to the source of the Humboldt, follow this watercourse to its disappearance, and then cross the desert of Nevada to the Truckee. Throughout, the second half of the trail was drier and harsher than the first, and it offered fewer places where the overland parties could find supplies or assistance. The immigrant groups who used the California Trail went heavily armed against possible attack by the Indians of the plains and the intermontane plateaus. In truth, however, the real dangers of the trail turned out to be accidents with firearms and the hazards of dangerous river crossings.

The California Trail was heavily used, beginning with the 1849 overland immigration of the Forty-niners. The more than 400 surviving diaries of immigrants using the trail in that year alone celebrated its landmark status as part of America's pioneering experience. Between 1849 and 1860, something on the order of 200,000 immigrants journeyed over it to California. The crossing was less expensive than the sea route—at least in the early years—and it used wagons, draft animals, and supplies widely available to Americans at the time. It also required skills shared almost universally by families from the farms that were characteristic of the nation at the time. As ship services expanded and the cost declined, many newer argonauts went to California by sea. The development of the transcontinental railroad, completed in 1869, ended the use of the California Trail.

### **Campbell, Thomas** (1763–1854) *religious leader*

Thomas Campbell was a Protestant minister and, with his father, Thomas, cofounder of the Christian Church (Disciples of Christ). Thomas Campbell was born in County Down, Ireland, on February 1, 1763. Though raised an Anglican, he joined the Seceder branch of the Presbyterian church, was educated at the University of Glasgow, and was especially trained for preaching in the Antiburgher faction of the church. Adept at classical Greek and Latin, Campbell also adopted the Common Sense theories of the

Scottish philosopher Thomas Reid. He began preaching in 1798 and assumed the pulpit of the Ahorey Church but grew disillusioned by the rampant factionalism he encountered. In 1805 he made a concerted attempt to unite the Burgher and Antiburgher cliques of the Seceder Church during their annual synod, but failed. Discouraged, by 1807 he had begun questioning Presbyterian practices, and he subsequently relocated to the wilds of western Pennsylvania to hone his theological concepts. In 1808, Campbell was assigned to the presbytery of Chartiers, Pennsylvania, where he expressed doubts as to the legitimacy of creeds, confessions, fast days, and other facets he ascribed to human authority. This apostasy resulted in Campbell's dismissal from the Presbyterian Church in September 1808, but he continued on as an itinerant preacher.

In August 1809 Campbell founded the Christian Association of Washington (Pennsylvania), which served as a pulpit for his Restorationist program. Here he formally denounced creeds and confessions as divisive and espoused a primitive form of Christianity based solely on New Testament precepts. "Where the Scripture speak, we will Speak," the church dictum rang, "Where the Scriptures are silent, we are silent." Campbell further enunciated his principles by publishing *A Declaration and an Address* (1809), which held that understanding the Bible, being the word of God, is within the grasp of any rational person. Furthermore, any church practices not mentioned in Scripture are human and not divine in origin, hence irrelevant. To Campbell, the New Testament alone formed the sole basis for uniting all Christians.

By 1812 Campbell was joined by his son, Alexander Campbell, and together they preached and established small academies throughout the Old Northwest. Reaction was mixed: Although the laity responded favorably to calls for unity, the Presbyterian community looked askance at the notion of Restorationism. In 1812 Campbell enjoyed a brief union with the Redstone Baptist Association, but he became a pariah for attacking Baptist emotionalism at the expense of rationalism and was expelled.

Eventually the Campbellites merged with Barton W. Stone's followers, thus giving rise to a new church, the Disciples of Christ. Thomas Campbell continued working closely with his son and successor until his death in Bethany, (West) Virginia on January 4, 1854. His advocacy of unity and rationality amongst Christians renders him an important theological figure, whose tenets found their greatest expression in the forthcoming Fundamentalist Movement.

## canal era

From the beginning of the 19th century until the rise of the railroads, canals were extremely important to the internal transportation and trade of the United States. Best described as artificially constructed waterways or existing rivers modified, canals straightened and regularized water passages to make them more accessible to boat traffic. River transportation into the West had been limited because of the Appalachian Mountains and the fall line (the line of waterfalls on major American rivers that marked a significant drop in the land level). Through a sophisticated system of locks and levels, canals provided a dependable, controllable route over the uneven terrain that separated the East Coast from the developing frontier.

Canal building fed on the dream of connecting all of the major American waterways into a continuous, low-cost transportation network. The construction of a series of canals made the mass transport of goods and people to the inland frontier easier, and triggered wild speculation along the developing canal routes. The enthusiasm for canals during the first half of the 19th century exemplified the energetic optimism of American entrepreneurs looking to maximize opportunities in the developing West.

The earliest canals operated in limited areas near the eastern coast, but some of these engineering projects did succeed in bypassing the fall line. The first American canals to circumvent the line were the Patowmack Company's canal at Great Falls, Maryland (built between 1786 and 1808), and the Western Inland Lock Navigation Company's canal on the Mohawk River near Little Falls, New York (1795). Other canals connected important rivers and commercial centers, such as the Santee and Cooper Canal in South Carolina (1792–1800); and the Middlesex Canal, which connected Boston to the Merrimac River and thus to the interior of New England (1793). These early canals often had engineering flaws due to the builders' lack of knowledge about their proper construction. Gradually, experienced engineers—mostly from England—were recruited to correct these problems.

The true test of canal engineering skill would be the ERIE CANAL, for many years the most important and successful of all the canal projects. Built from 1817 to 1826, the Erie Canal connected the Atlantic Ocean to Lake Erie, and thus the entire Great Lakes region, creating a commercial artery able to transport goods easily to and from the developing Northwest. The Erie was so profitable that tolls collected from it financed a system of auxiliary lateral canals in New York State. This canal also provided a valuable basis for future canal engineering. Led by Benjamin Wright, the "Erie School" of engineers would go on to build canals across the expanding United States.

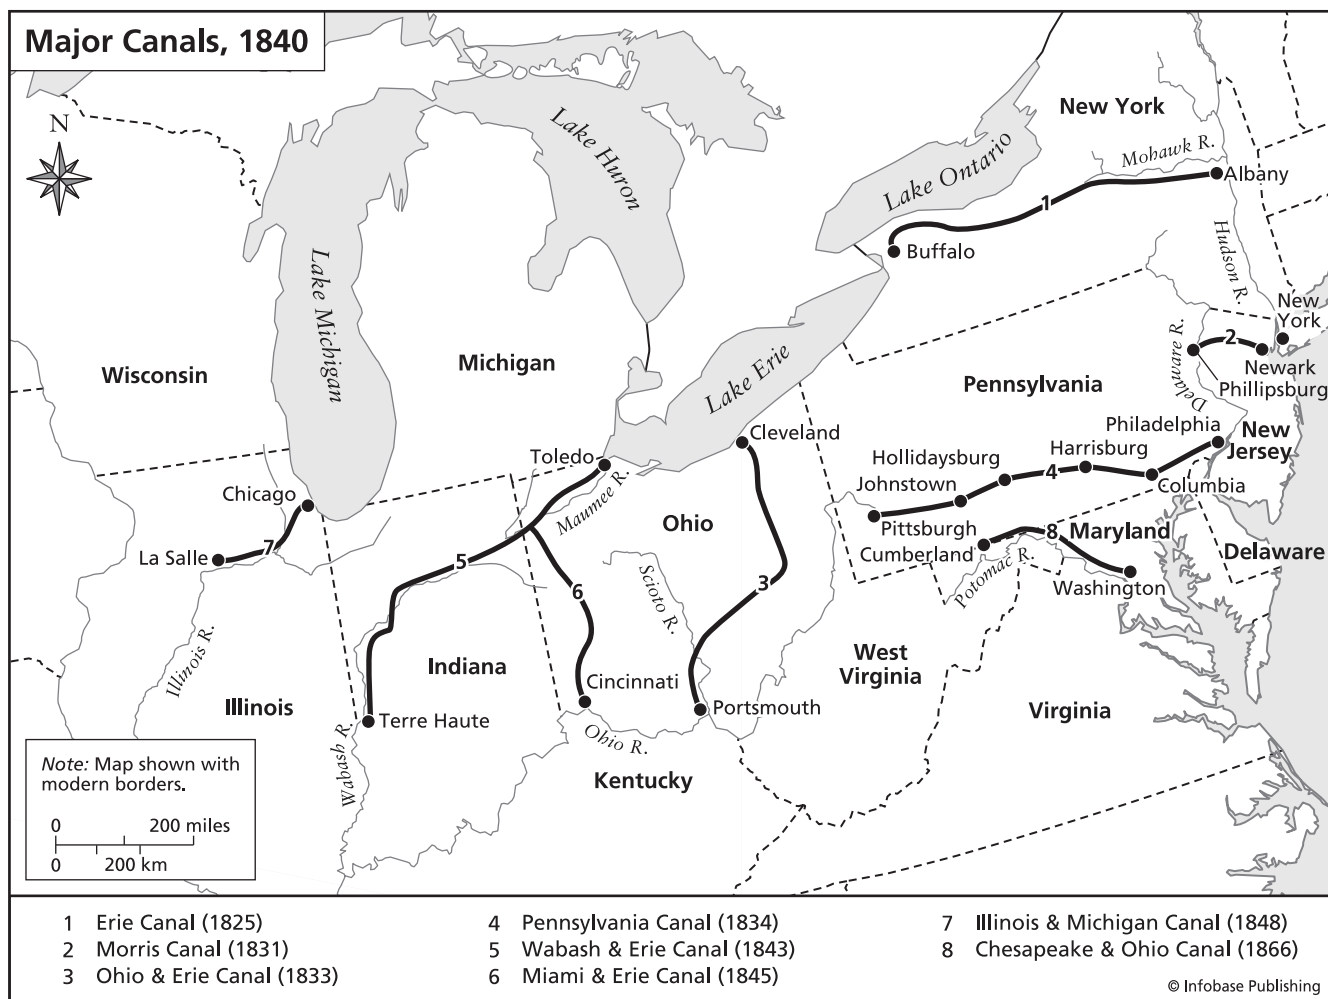

The Erie Canal transformed the economy of New York City and brought about the rapid development of

the inland towns located near the canal in upstate New York. Successfully completed through state and private—but no federal—funding, the Erie example inspired other engineers and entrepreneurs to propose canal projects in other states. No canal project would approach the success of the Erie Canal, but builders tried. Some of the other canals built during the height of the canal era include the Pennsylvania Main Line Canal (1826–34), the Chesapeake and Ohio Canal (1828–50), the Lehigh Canal (1827–29), the Whitewater Canal (1836–43), and the Union Canal (1821–27).

Financing canal projects was a risky, complicated proposition. Usually canals were funded either by states or by private companies. States bore the brunt of costs in cases where canals were planned in newly developing areas without established industries. When canals were proposed along existing trade routes or centered on the transport of a single resource, private companies usually financed them. State-funded projects received land subsidies and other advantages but were the least successful ventures due to poor management or unsound construction. Privately funded canals were more profitable, since they were constructed to meet business needs, not to accommodate political objectives. Besides land subsidies, the other financing methods common in promoting canals included issuing stock, conducting lotteries, toll collecting on existing canals, local grants, and direct cash funding.

The success of the Erie Canal encouraged speculators and investors to believe that every canal project would be equally profitable. With the opening up of the Northwest to settlement, entrepreneurs and state boosters considered canal building the best way to capitalize on the abundant natural resources in new states like Ohio, Indiana, and Illinois. "Wildcat" bankers gambled on far-fetched projects, and gullible foreign investors were encouraged by the federal government to buy state bond issues in order to finance canal construction. These states were not as fiscally strong as the national government, and they were often unable to repay the enormous debts they took on to build canals. During the 1840s, four states defaulted on their canal debts: Indiana, Maryland, Pennsylvania, and Illinois. None of these projects combined the ingredients that made the Erie Canal prosper.

The construction and operation of canals required enormous manpower. Construction crews—many of them recent immigrants from Ireland and Germany—carved out the canals with only horsepower and blasting powder. Once constructed, canals required numerous specialized personnel, including lock tenders, maintenance people, ratters (to control the vermin population), level walkers, carpenters, and section bosses. Personnel on the canal boats usually consisted of a captain, mule or horse driver, and sometimes a night crew for around-the-clock operation.

People and goods traveled on canals in two different kinds of canal boats. Packet boats carried passengers and were drawn by horses. Before the railroad, packet travel was the fastest form of inland transportation available. Freight was transported by two different kinds of vessels: company boats and private boats. Company boats were more uniform in size and design and carried greater weight. Operated by the established industries along the canal route, these boats comprised a line distinguished by specific markings. Private boats were, as the name would indicate, individually owned and varied in size, capacity, and design. Freight boats were drawn by mules and thus slower than packets. Packet travel declined rapidly with the advent of railroads, but freight boats continued to operate profitably for considerably longer. Rail transportation eclipsed canals by the 1870s, offering a quicker, more versatile way to move people and commodities. The American canal system did not die out completely—in many coastal regions and along major rivers, canals still provide the most efficient method for shipping goods. While canals failed

to become the national transportation network, the mania for canal building presaged many of the patterns visible in later efforts to build transportation infrastructure through railways and roads.

### The Caroline affair

On the night of December 29, 1837, Canadian militia operating under British command burned the U.S.-flagged steamer ship *Caroline*, which was moored in U.S. waters at the settlement of Fort Schlosser, New York, at Niagara Falls. The incursion briefly threatened to throw the United States and the British Empire into war.

In 1837 anticolonial uprisings had broken out in Lower Canada (now Quebec and vicinity), Upper Canada (now Ontario and vicinity), and the western British territories. The rebel “Patriots” (or “*Patriotes*” in the francophone sections) called for the establishment of independent republics and eventual annexation to the United States.

Seeking to nip the brewing revolution in the bud, the British had preemptively arrested the rebel leaders, forcing the Patriot volunteers into battle before they had organized as a militia. Consequently, the disorganized and poorly led Patriot army in Upper Canada had been routed almost from the moment the new republic was declared. The rebel leader, William Lyon MacKenzie, made a daring flight to safety in the United States, where sympathizers were already forming support organizations, called “Hunter’s Lodges” along the Upper Canada border and “*Freres Chasseurs*” along Lower Canada, to help launch a guerrilla campaign. Arriving in Buffalo, New York, on December 11, 1837, MacKenzie was given a hero’s welcome by the citizenry, many of whom immediately volunteered for his cause.

Having procured the use of the USS *Caroline* and a considerable arsenal from local law-enforcement and militia groups, MacKenzie established himself on Navy Island, lying between the Canadian and American shores just above Niagara Falls, and began to ferry arms, ammunition, and supplies to the republican guerrillas across the river. Two weeks later, loyalist units assaulted the island and burned the *Caroline* as it lay off the opposite shore. An American was killed in the assault, and when one of the loyalists, Alexander McLeod, was later arrested on the New York side of the river, he was criminally charged with murder and arson.

Great Britain, already enraged by the widespread participation of American citizens in the guerrilla attacks, threatened full-scale war. The British threat to widen and formalize the hostilities grew out of their belief that Canada was ultimately indefensible in the face of a sustained onslaught from the populous new American nation. The threat was intended to remind American officials that the British navy could still inflict vast damage on the already troubled American economy in retribution if Canada was lost.

For their part, President MARTIN VAN BUREN and his advisers were well aware that only last-minute American victories had turned humiliating defeat to honorable peace in the WAR OF 1812. Already struggling with the unprecedented economic crisis of the PANIC OF 1837, they had no desire for a costly rematch with their nemesis. Van Buren’s administration applied increasing pressure on the local authorities along the northern border to disarm the Patriot armies and halt the smuggling of supplies. MacKenzie and other Patriot leaders were arrested and jailed for violation

of the Neutrality Act. By the end of 1838, the Canadian revolution had been brutally crushed through the execution and deportation to Australia of rebels, including U.S. citizens.

The 1837–38 revolution prompted sweeping reforms in Canada, but their experience in the United States embittered MacKenzie and other Patriot leaders towards the republic they had previously idealized. A general pardon allowed them to return to Canada in 1849. Relations between the United States and Great Britain remained tense, however, and raw anger along the border fed the so-called AROOSTOOK WAR of 1838–39.

### **Carson, Kit** (1809–1868) *frontiersman, soldier*

Kit Carson was a frontier scout and Indian agent whose contributions to westward expansion made him a folk hero. Christopher (Kit) Carson was born in Madison, Kentucky, on December 24, 1809, and shortly thereafter moved with his family to Howard County, Missouri. He was almost bereft of education and functionally illiterate throughout his life. In 1824, while he was in his teens, Carson’s father died, and the young Kit became apprenticed to a saddle maker. Finding the work distasteful, he ran away by joining a wagon train on the SANTA FE TRAIL in 1826. For three years, he worked as a teamster, interpreter, and cook, but in 1829 Carson accompanied Ewing Young on a fur-trapping expedition into the Southwest. The experience impressed him indelibly, and over the next 10 years Carson hunted, trapped, and roamed throughout the western interior. He took readily to such an arduous, adventurous lifestyle and eventually became renowned as a skilled, honest, yet soft-spoken frontiersmen. Also well known among the various Plains Indians, he successively took Arapaho and Cheyenne women as wives. Carson met his third and final wife, Maria Josepha Jaramilla, at Taos, New Mexico, where he was also baptized into the Roman Catholic Church. The dusty frontier community of Taos then became the beloved home to which he inevitably returned.

The defining moment in Carson’s life occurred in 1842, when he had a chance encounter with Army explorer Lieutenant JOHN C. FRÉMONT, then headed west on an expedition to SOUTH PASS. The two men formed an abiding

friendship, and Carson became employed as a scout. In 1843, he again assisted Frémont on a second expedition to the Rocky Mountains, and accompanied a third to CALIFORNIA in 1846. There Carson became caught up in the BEAR FLAG REVOLT against Mexico at Frémont's behest and also participated in the capture of Los Angeles and San Diego. In 1847, he was entrusted with carrying important dispatches back to Washington, D.C., but en route he ran into Brigadier General STEPHEN WATTS KEARNY. In need of an experienced guide, Kearney ordered Carson to accompany his column back to California, and he complied. He subsequently played a conspicuous role in the ill-fated, December 1847 Battle of San Pascual against mounted Californians, and he further distinguished himself by riding singlehandedly back to San Diego for reinforcements. Given this exemplary performance, President JAMES K. POLK proffered him a lieutenant's commission in the elite Mounted Rifles Regiment. However, the Senate obstructed his confirmation in an attempt to further embarrass Frémont, who was then being court-martialed over a dispute with Kearny.

After the Mexican-American War, Carson returned to Taos and served as an Indian agent among the Ute, Pueblo,

Christopher "Kit" Carson (Library of Congress)

and Apache tribes. He functioned quietly and capably in this capacity and distinguished himself from many contemporaries by calling for better and fairer treatment of NATIVE AMERICANS. Shortly after the Civil War commenced in April 1861, Carson was commissioned colonel of the First New Mexico Volunteer Infantry. He skirmished with an invading Confederate column advancing from Texas and won plaudits for his handling of the Navajo crisis of 1863. When this large nation refused to move peacefully onto reservations, Carson was dispatched by General James H. Carlton to subdue them by force. This he accomplished by waging a scorched-earth policy that destroyed dwellings, crops, and livestock. Such harassment eventually drove the weary and half-frozen warriors onto the Bosque Redondo Reservation. However, when war erupted in the Texas panhandle, Carson further enhanced his reputation as a peerless Indian fighter by battling several thousand mounted warriors to a standstill at the Battle of Adobe Walls, November 1864. In light of such sterling service, Carson's final wartime rank was brevet brigadier general of volunteers.

After the war, Carson resigned his commission, resumed his Indian agent activity at Taos, and gained appointment as superintendent of Indian affairs for Colorado Territory. However, he had no sooner assumed that office than he died at Fort Lyon, Colorado, on May 23, 1868. Carson's remains were subsequently interred near his home at Taos. By this time, he was a legendary frontier figure, renowned for his honesty, humility, and sagacity. Carson's activities were also celebrated nationally, thanks to the various publications of Frémont, and he had proved supremely important to the exploration, conquest, and settlement of the far West. Short and physically nondescript, Carson was certainly among the most skilled frontiersmen of his generation, an icon whose reputation only increased with his passing. A river, a mountain pass, and the capital of Nevada perpetuate his memory.

### **Cass, Lewis** (1782–1866) *politician*

Lewis Cass's 54 years of public service spanned the tumultuous early to mid-19th century. Born in Exeter, New Hampshire, Cass emigrated to the Northwest Territory in 1801, where he studied law privately and was admitted to the bar in 1802. In 1806 he was elected to the Ohio legislature,

where his staunch opposition to Aaron Burr's endeavors and strong support of President Thomas Jefferson resulted in his appointment by Jefferson as United States Marshal for the District of Ohio in 1807.

At the outbreak of the WAR OF 1812, Cass resigned his position as marshal to enlist in the army where he served as a colonel of the Third Infantry under the command of General WILLIAM HULL, a former Revolutionary War hero who was in command of Fort Detroit and who surrendered the fort to a much smaller British force without firing a shot. Cass was present at the surrender, wrote a report scathingly critical of Hull's performance, and testified against Hull at the court-martial proceedings. Hull was found guilty of treason and was sentenced to death by firing squad. Only his Revolutionary War service record allowed him to avoid execution.

Promoted to brigadier general in March 1813, Cass went on to be instrumental in the American victory at the BATTLE OF THE THAMES the following year. Cass's distinguished military service, as well as his Jeffersonian political views, resulted in his appointment as military and civil governor of Michigan Territory, a post he would hold until 1831. During his tenure, Cass secured the territory around the Great Lakes, improved the territory's infrastructure, and negotiated treaties with the Chippewa and other Native American nations.

Cass's experience in dealing with the NATIVE AMERICANS of the Northwest Territory and his ideas about the "Indian Question" were instrumental in his appointment by President ANDREW JACKSON as secretary of war in 1831. Cass was at the forefront of formulating government policy regarding Native Americans, and he was a central figure in promoting their removal as a general policy during his tenures as governor and as secretary of war.

In 1836 Cass resigned from the cabinet when Jackson appointed him to a diplomatic post, envoy extraordinary and minister plenipotentiary to France. He served in this capacity until 1842. While Cass was successful in many of his diplomatic endeavors regarding American and French relations, he was often at odds with the Jackson administration because of his outspoken anti-British views. Such negative public rhetoric led to a serious disagreement with Secretary of State DANIEL WEBSTER and prompted Cass's resignation in 1842.

Returning to Detroit, Michigan, Cass decided to reenter public service. He was easily elected to the U.S. Senate in 1845, but resigned his seat when he received the presidential nomination of the DEMOCRATIC PARTY in 1848. The nominating conventions and presidential election of 1848 reflected the divisiveness of the nation over the issue of the expansion of SLAVERY. Cass favored letting the residents of territories decide for themselves whether they wanted slavery—a concept that he termed POPULAR

Lewis Cass (Library of Congress)

SOVEREIGNTY. That did not sit well with southern Democrats, who wanted the areas acquired as a result of the MEXICAN-AMERICAN WAR to allow slavery. The WHIGS nominated Mexican War hero ZACHARY TAYLOR. His long military record would appeal to northerners; his ownership of slaves would lure southern votes. Taylor would not commit himself on the issue of Congress's power over slavery in the territories.

A third party, the FREE-SOIL PARTY, made its debut in 1848. Formed by New York Democrats who unequivocally opposed the extension of slavery into the new territories, the Free-Soilers nominated former president MARTIN VAN BUREN. The Free-Soil platform appealed to antislavery Whigs and northern Democrats, and Van Buren won more than 10 percent of the national vote. In New York, he won more than 120,000 votes—votes that otherwise would have been cast, largely, for Cass. This effectively gave Taylor New York's electoral votes.

After his unsuccessful bid for the presidency, Cass returned to the U.S. Senate, serving there until 1857, when President James Buchanan named him secretary of state. As

a senator, Lewis Cass was a strong advocate of compromise, and worked diligently for passage of the COMPROMISE OF 1850. However, after joining the Buchanan cabinet as secretary of state, Cass became convinced that stronger measures were necessary. When President Buchanan refused to fortify Fort Sumter and other federal garrisons as the South began to threaten disunion, Cass resigned from the cabinet. He retired to his home in Detroit, where he spent his last years writing and where he died on June 17, 1866.

### **Catlin, George** (1796–1872) *American artist*

Best known for his paintings of NATIVE AMERICANS and Western scenes—the first American artist to focus on these subjects—George Catlin was born in Wilkes-Barre, Pennsylvania, in 1796. His interest in Native American cultures can be partially traced to his family experiences. Catlin's mother, Polly Sutton Catlin, was captured by Indians as a child. He learned about Indian ways from her and from the visitors to the Catlin home during his childhood: trappers, traders, and soldiers who had dealings with the Indian of the trans-Appalachian region. Although Catlin received little formal education, he learned hunting, fishing, and other skills necessary for life in rural Pennsylvania. He was always interested in exploring nature and collected Indians artifacts on his outings.

In 1817 Catlin went to Litchfield, Connecticut, to study law in the offices of the well-known jurist Tapping Reeve. While in Litchfield, he began to make a name for himself as an amateur artist, painting mostly portraits of political figures. After finishing his studies in 1818, he practiced law in Luzerne, Pennsylvania, until 1823. He then moved to Philadelphia, determined to paint professionally. He studied painting at the Pennsylvania Academy of Fine Arts and at the National Academy of Design in New York. For the next few years, he earned his living by painting portraits, many of prominent figures such as New York governor DeWitt Clinton and former First Lady Dolly Madison. From 1824 to 1829 he spent most of his time in Washington, D.C., painting political figures. In 1828 he married Clara B. Gregory in Albany, New York. She was supportive of his career and joined him on many of his later journeys to the West.

During his time in Philadelphia, Catlin encountered Indian chieftains who visited Charles Willson Peale's famous American Museum. The young artist was enthralled

with these Native Americans and the cultural artifacts they brought with them. Believing that the Indians and their ways of life were declining, he decided to use his artistic abilities to document their vanishing culture for posterity. He began by painting Indians on reservations in western New York, and then traveled to the Ohio River and Mississippi River regions. Catlin's premonition that he was documenting an endangered culture was perceptive. As European-American settlement moved further west, demand for Indian lands increased, and thus the trans-Appalachian Indians were forced further west onto reservations. The decline of the fur trade and the spread of disease also threatened their cultural stability. Catlin's paintings depict a conflicted, chaotic time for these displaced nations as they struggled to maintain their cultural practices and economic viability.

From 1830 to 1836 he spent his summers following various Indian nations; in winter, he would return to the East to paint what he had seen and to raise money so he could return to the West. One of his most important early works was his moving portrait of the aging Shawnee Prophet, Tenskwatawa (brother of Tecumseh), painted in 1830. Also that year, Catlin met explorer William Clark, then the superintendent of Indian affairs at St. Louis. He accompanied Clark on a trip to solidify Indian treaties. During the journey, he painted Iowa, Missouri, Otoe, Omaha, Sauk and Fox, and Sioux Indians. In 1832 he traveled up the Missouri on the *Yellow Stone*. Owned by the American Fur Company, this steamboat was the first to reach Fort Union at the mouth of the Yellowstone River. By traveling to this remote territory, Catlin was able to depict nations not previously familiar to Americans in the East and Europeans, such as the Blackfeet, Crow, Plains Cree, Mandan, and Yankton Sioux. He continued to travel further west, journeying to Pawnee and Comanche country in 1834 and becoming the first non-Indian to see the red stone quarry in southwestern Minnesota. The distinctive red stone, used by many tribes to make pipes, was later named Catlinite in his honor.

During the 1830s Catlin painted over 500 portraits of Indian men and women in Native dress. He also painted scenes of Indian villages, religious ceremonies, games, and legends. From 1837 to 1852 he lectured and exhibited his paintings in the United States and Europe. Called "Catlin's Indian Gallery," this exhibition was a success in other countries but not particularly well received in America. In an attempt to ease his financial woes, he offered to sell his collection of Indian paintings to Congress in 1852 but was refused. Instead, he borrowed money from Joseph Harrison of Philadelphia, who took the collection as collateral. Catlin was never able to recover the paintings, but Joseph Harrison's family eventually donated the collection to the United States National Museum.

After 1852, Catlin continued to paint and write about his experiences with Indians. His most important early writings were published in a series of accounts, "Notes of Eight Years Travel Amongst the North American Indians," in the New York *Daily Commercial Advertiser* from 1830 to 1839. Other works include: *Letters and Notes on the Manners, Customs, and Condition of the North American Indians* (1841); *Catlin's North American Indian Portfolio: Hunting, Rocky Mountains and Prairies of America* (1845); *Catlin's Notes of Eight Years' Travels and Residence in Europe* (1848); and *Life Among the Indians* (1867). In later years, he traveled among and depicted the Indians of South America as well, writing *Last Rambles Amongst the Indians of the Rocky Mountains and the Andes* (1868).

Catlin's paintings of Indian life are important because he captured a disappearing way of life, depicting Indians specifically and candidly. He respected his Indian subjects and worked tirelessly to educate whites about their culture. His works provide valuable records of nations that did not survive contact with Europeans. His documentation of the Mandan of the upper Missouri was particularly important, since they were practically wiped out by smallpox in 1837. Most respected for his descriptive powers, he was less concerned with technical accuracy in perspective. Thus, his paintings evoke historically significant figures and themes, not classical aesthetic concerns. Most of his works are now owned by the Smithsonian Institution in Washington, D.C.; the Joslyn Art Museum in Omaha; and the American Museum of Natural History in New York.

George Catlin died in Jersey City, New Jersey, in 1872. Although he was financially unsuccessful and received only little recognition during his lifetime, he is now considered one of the most important and original American artists of the 19th century. As he had intended, Catlin's works have visually preserved the vital Indian cultures that were forever transformed by the American expansion to the West.

## Cherokee

One of the so-called Five Civilized Tribes the Cherokee were forcibly removed from Georgia in 1838. The Cherokee were an Iroquoian-speaking tribe who, at one point in their history, controlled large parts of Virginia, North Carolina, South Carolina, Tennessee, and Alabama. In their heyday they constituted a formidable body of warriors and an obstacle to white migration over the Appalachian

Mountains. In the 18th century, however, numerous wars with British and American forces dissipated their strength and resulted in several land cessions to the United States. By the dawn of the 19th century, tribal holdings had been reduced to swaths of land in Georgia and western North Carolina.

The Cherokee were also cognizant of the great military strength of their neighbor, the Creek, so during the WAR OF 1812 they fought on behalf of General ANDREW JACKSON in 1814 at the Battle of Horseshoe Bend. After the war, white settlers continued to encroach on Cherokee lands and violence occasionally broke out. But the Cherokee were determined to demonstrate their ability to become "civilized" as a strategy to stave off further encroachment. Many tribesmen consequently abandoned traditional hunting in favor of farming, even acquiring several thousand African-American slaves. Missionaries were also prevalent on Cherokee land, operating 18 tribal schools. In 1826 SEQUOYAH (1770–1843) single-handedly invented a Cherokee alphabet in anticipation of the first tribal newsletter, the *Cherokee Phoenix*. The Cherokee also adopted many trappings of American-style governance, including a bicameral legislature with eight voting districts. Moreover, in 1829 their government declared that all Cherokee held the land in common and that only their government could sell it to the United States.

The turning point in Cherokee fortunes happened in 1829 with the discovery of GOLD. The government of Georgia began to apply pressure upon the tribesmen to sell their land and relocate across the Mississippi River. The administration of President Andrew Jackson intensified this pressure by signing the INDIAN REMOVAL ACT of 1830. Tribal leaders appealed to the U.S. Supreme Court for assistance, but the Court ruled it lacked jurisdiction. The following year Chief Justice John Marshall ruled in the case of *Worcester v. Georgia* that state authorities had acted unconstitutionally by imposing authority over the Cherokee people. When Jackson refused to intercede on behalf of the Indians, however, a small group of mixed-blood dissenters under JOHN RIDGE (1803–39) concluded it was better to sell their land for cash than have it forcibly taken, so they signed the Treaty of New Echota in 1834. Ridge and his followers then took their families and belongings to the Indian Territory (Oklahoma) to begin new lives, but the bulk of the tribe under Chief JOHN ROSS (1790–1866) resisted deportation to the very last moment. Jackson then ordered the army to evict the Indians over the winter of 1838–39. Thus began the infamous TRAIL OF TEARS, the forced migration along whose route some 4,000 Indians, representing one-fourth of the Cherokee people, perished.

No sooner had Ross and his followers arrived in Oklahoma than frictions and factions arose with Ridge's followers, the so-called Old Settlers, who had arrived years before.

On June 22, 1839, Ridge, his son, and ELIAS BOUDINOT (ca. 1803–39) were assassinated by Cherokee who felt that these men had betrayed their people. A bloody civil war loomed. Ross, however, managed to bring all parties together in an Act of Union the following year. For the next two decades the Cherokee rebuilt their society, introducing farms, schools, towns, and a new newspaper, the *Cherokee Advocate*. That the tribesmen succeeded and acquired considerable wealth is a tribute to Ross's leadership and devotion to his people. The outbreak of the American Civil War (1861–65), however, rent the tribe apart again, opening old wounds and further decimating the population. The plight of the Cherokee has since come to symbolize the abuse that most Native Americans suffered at the hands of the U.S. government.

## Chickasaw

One of the so-called Five Civilized Tribes, the Chickasaw were a Muskogean-speaking people living in northern Mississippi and western Tennessee by the time of the American Revolution. They were renowned locally for their prowess in battle and tactful diplomacy in peace. The Chickasaw had weathered contact with various European powers as early as 1540 and fought either with or against the Spanish, the French, and the English. After 1783 they readily acquiesced to the Treaty of Hopewell in 1785 to deal with the newly emergent United States. Contact with Americans increased following the Treaty of San Lorenzo in 1795, whereby Spain renounced all claims to land west of the Mississippi River. This resulted in an influx of settlers and missionaries along the Natchez Trace, a route that cut directly through Chickasaw land. The U.S. government made unofficial attempts to “civilize” the tribesmen through farming and other domestic skills, which the Indians were determined to resist.

When Mississippi was admitted to the Union in 1817, the new state began to press for new NATIVE AMERICAN land cessions, and the pressure increased throughout the 1820s. Cognizant of their weakness, the Chickasaw sent a deputation to meet with President ANDREW JACKSON in Franklin, Tennessee. In the Treaty of Pontotoc Creek, signed on October 20, 1832, they formally surrendered all land ownership in Mississippi. In 1836 the Chickasaw relocated to new homes in the Indian Territory (Oklahoma) and temporarily occupied land owned by the Choctaw until they formally acquired territory for their own new settle-

ments. A total of 5,000 Indians and roughly 1,100 African-American slaves made the journey in comparative safety and comfort.

The Chickasaw finally conferred with their Choctaw neighbors in January 1837 in Doaksville, whereby they acquired the western portion of their tribal lands. This agreement was approved by the U.S. Senate the following month. Once established, the Chickasaw readily adapted to their new environment and grew relatively wealthy through cattle raising, health spas, and other economic activities. In 1856 they adopted their own constitution and established a new capital at Tishomingo, where it remains today.

## Choctaw

One of the so-called Five Civilized Tribes, the Choctaw were a group of Muskogean-speaking NATIVE AMERICANS originally from the southeastern United States, principally Mississippi. Unlike their neighbors, the Creek and Chickasaw, they were sedentary farmers who lived in villages and employed a democratic style of governance. The Choctaw were also unique among regional cultures in that men and women alike wore their hair very long, whereas in neighboring tribes men usually shaved their heads. Their first contact with Europeans came in 1541 when they skirmished with the Spanish under Hernando de Soto (ca. 1496–1542). They alternately sided with the English or French through 1763.

After the American Revolution ended in 1783, the Choctaw grew increasingly dependent upon the Spanish for arms and ammunition. The Louisiana Purchase of 1803 left the Choctaw isolated from their Spanish allies and under increasing pressure from American settlers moving westward. Despite this friction, the Choctaw remained amicably disposed toward the United States. In 1811 Chief PUSHMATAHA rejected Tecumseh's call for a pan-Indian alliance against the Americans. When the Creek War erupted in August 1813, the Choctaw allied themselves with their white neighbors, contributing about 1,000 warriors to serve under General ANDREW JACKSON at the BATTLE OF NEW ORLEANS in 1815.

Their faithfulness did not avail them any permanent advantages with their allies, however. Again they faced

coercion to sell their lands to the government. The Choctaw refused to comply at first, and in 1826 they even adopted a written constitution and a representative government to demonstrate how well they could adapt to European-style civilization. In 1816 the Choctaw nonetheless signed treaties with the United States ceding additional lands, at which time the American Board of Commissioners for Foreign Missions established schools to aid in their assimilation. Four years later the tribe reached an agreement with the United States to relinquish all their land in Mississippi. The government did not immediately evict the Choctaw from their land, but with the signing of the Treaty of Dancing Rabbit Creek in 1830, President Andrew Jackson began the process of removing entire nations across the Mississippi River in the winter of 1831–32. Many Choctaw died of hunger or exposure during this trip, known to them as the TRAIL OF TEARS, before they resettled along the banks of the Arkansas River in Indian Territory (Oklahoma).

A period of difficult readjustment ensued, but gradually the Choctaw acclimated themselves to farming and hunting in this new land. In 1834 the Choctaw rewrote their constitution, and in 1842 the tribal government seized control of all schools from the missionaries, although whites were still allowed to staff them. A small portion of the tribe was also allowed to remain in Mississippi as sharecroppers and wage laborers; yet they maintained their identity and community through traditional games such as stickball and traditional rites such as funeral ceremonies.

—John C. Fredriksen

## Chouteau family

The Chouteaus were successful businessmen on the American frontier, facilitating the lucrative FUR TRADE between Indians (particularly the Osage), white Americans, and Europeans for nearly a century. They were also influential in the development of St. Louis and the surrounding region, acting as bankers, land speculators, public officials, and governmental advisers for the frontier settlement.

The matriarch of the dynasty was Marie Thérèse Bourgeois (1733–1814), who was born in New Orleans. She married tavern keeper René Chouteau, and their first son, René Auguste, was born in 1749. René Chouteau soon returned home to France, abandoning his young bride and child. But Marie, who styled herself “Widow Chouteau,” was determined to eke out an existence. In about 1755 she entered into a common-law marriage with the French-born

fur trader Pierre Laclède (1724–78), and the union produced another four children. All the siblings subsequently adopted the name Chouteau to avoid stigmatization arising from their illegitimacy. In 1765 Madame Chouteau joined her new husband at his new settlement in St. Louis, where she proved herself an accomplished businesswoman. From 1767 she also successfully thwarted attempts by her former husband, now back at New Orleans, to assert his marital rights over her property and children, which persisted until his death in 1776. Madame Chouteau died in St. Louis in 1814, much beloved and highly regarded as the matriarch of her city.

Originally from New Orleans, René Auguste Chouteau (1749–1829) began his life as a trader at age 14, working for his stepfather, Pierre Laclède. In 1764 he helped establish a fur-trading post and fort near the confluence of the Mississippi and Missouri Rivers, the area now known as St. Louis. He became Laclède's partner in 1768 and acquired principal ownership after his stepfather's death in 1778. In the late 18th century the Chouteau company monopolized trade with the Osage and would continue to be closely connected to their interests for the next half-century. René Auguste also acted as a diplomat to the Osage from the Spanish government during the years they controlled the Louisiana area. The Louisiana Purchase of 1803 induced him to switch allegiances over to the United States, and his opinion on trade and Indian matters was much sought after. In 1809, he became the chairman of the board of trustees in the newly incorporated town of St. Louis. He also represented the United States in various treaty negotiations with Indians in the Louisiana Territory. He maintained an active interest in the fur trade until the end of the WAR OF 1812, at which point he finally retired from the family business. He died in St. Louis in 1829.

Jean Pierre Chouteau (1758–1849) joined his brother René Auguste's enterprise and established a trading post at Salina, Oklahoma, in 1802. He was appointed as U.S. Indian agent for the upper Louisiana region by President Thomas Jefferson in 1804, the first such official designated for tribes west of the Mississippi River. In this role, he mediated relations between whites and Indians, helping to keep the peace by negotiating trade between these groups. He even twice accompanied Indian delegations to Washington, D.C., to confer with the president, and in 1809 he joined the trader Manuel Lisa to found the St. Louis MISSOURI FUR COMPANY. Because trade was encouraged as the way to maintain peace, some accused Jean Pierre of taking advantage of his position as both a trader and a government agent to advance his own commercial interests. Whatever his motive, Jean Pierre's diplomatic efforts among the Osage helped secure that nation's loyalty during the WAR OF 1812 and saved St. Louis from direct attack. Asked to leave his position as agent

in 1818, he returned to the family's trading business in Salina, occasionally advising the U.S. government about Indian affairs.

Jean Pierre's eldest son, Auguste Pierre Chouteau (1786–1838) was born in St. Louis. He attended the U.S. Military Academy at West Point (he was nominated by Meriwether Lewis), after which he joined the family business. He was also instrumental in founding the St. Louis-based MISSOURI FUR COMPANY, along with his father Jean Pierre, William Clark, Manuel Lisa, and others. He served in the War of 1812 as a captain of the territorial militia. After the conflict, Auguste Pierre continued to expand his family's trading empire by extending trade relations to the southern Arapaho and to fur traders in the Rocky Mountains. In 1815 he joined Jule DeMun in an unfortunate expedition to Santa Fe, New Mexico, in which Spanish authorities imprisoned both men for trade violations and confiscated all their goods. He also acted as a government representative, helping to mediate treaties between the United States and the Kiowa and Comanche from 1834 to 1838. He succeeded in this only after abandoning his wife in St. Louis, taking an Osage wife, and fathering several mixed-blood children. He died still heavily in debt at Fort Gibson in the Indian Territory.

Jean Pierre's younger son, Pierre Chouteau, Jr. (1789–1865), was also born in St. Louis, and entered the family business in 1805. He later became an agent for JOHN JACOB ASTOR'S AMERICAN FUR COMPANY and eventually bought the Missouri River interests of the company from Astor in 1834. In 1838 he started the highly successful Pierre Chouteau, Jr., and Company, which traded over the vast region between the Mississippi River and the Rocky Mountains until about 1865. In this capacity he was responsible for introducing the first steamboats on the upper Missouri. Following Astor's retirement in 1834, he also obtained and profitably managed the company's western department. He became the most powerful financier in the West in the years immediately preceding the Civil War. He spent his final years in New York as a wealthy fur trader and as an investor in newer western endeavors such as mining and railroads. By the time of his death in St. Louis in 1865, the Chouteau family had finally severed its long and historic ties to the fur trade and turned its attention to other fields.

As clever and cosmopolitan entrepreneurs, the Chouteaus played a major part in shaping the development of the trans-Mississippi West before 1865. While their private business ventures thrived in this new market, they also acted as public leaders, mediating relations among France, Spain, Great Britain, the United States, and Native Americans in this contested region. From the standpoint of impact, legacy, and longevity, the Chouteaus were in many respects the First Family of the American frontier.

## Church of Jesus Christ of Latter-day Saints

The Church of Jesus Christ of Latter-day Saints (more commonly known as the Mormon Church) was organized by JOSEPH SMITH, JR., in 1830 in Fayette, New York. In 1820, according to his own account, Smith received a direct revelation in the form of God the Father and his son, Jesus Christ, who anointed Smith a prophet, through whom the new church of Christ would be restored on earth. In later revelations, an angel named Moroni gave Smith the location of Golden Plates and the means to translate them. Smith completed the translation of the Book of Mormon from the plates in 1829. With its publication in 1830, Smith incorporated his church under New York law and began to preach his gospel to all who would listen to him.

The history of the church under its founder and first prophet, Joseph Smith, falls into three divisions. In the first, the church was located in Kirtland, Ohio, south and east of Cleveland, where Smith moved his headquarters after one of his disciples converted a congregation there. The Kirtland community of Saints grew rapidly, and Smith laid plans to erect the first church temple. Completed in 1836, the temple became the center of new religious ceremonies received by Smith in divine revelations. The church and its leaders were part of the prosperity associated with the time and place, and to take further advantage, Smith sought to establish a bank. His application denied, the bank went into operation anyway. When the PANIC OF 1837 brought chaos to the state banking system, the Kirtland Anti-Banking Society Bank collapsed, along with most of the other local banks. This failure intensified divisions within the church, based in part on the rumors that Smith had sanctioned POLYGAMY (plural wives) as a part of church doctrine. Some members of the church left, and Smith and his loyal followers left Kirtland and moved to Mormon settlements in Missouri.

The Mormon community in Missouri dated from a missionary enterprise of the early 1830s, which had gone west to convert Indians. The centers of Mormon settlements were originally in Jackson County, north of Kansas City,

and later farther north in Ray County. The sudden growth of the Mormon community by the influx from Kirtland began a period of expansion. Tensions with the surrounding population eventually developed, centering around the Mormons' growth and prosperity, their strong sense of group loyalty, their sympathy toward slaves, and their belligerence in defending what they thought of as their rights. As their neighbors began armed raids against outlying Mormon settlements, church leaders responded by organizing a paramilitary group known as the Sons of Dan, or the Danites. The attacks on the Mormons grew to include armed raids, arson, and murder. The Mormons responded in kind to what they saw as unprovoked aggression and the failure of the civil legal system to protect them.

The governor of Missouri, Lillburn W. Boggs, called out the militia. Believing that the Mormons were an undisciplined mob of religious fanatics, Boggs ordered them to leave Missouri or face extermination. Smith realized that his followers, however loyal and disciplined, stood no chance in conflict with a militia that had unlimited numbers and artillery, and he ordered the surrender of the church. He and other church leaders were imprisoned for several months without formal charges, while the members of the church were driven from the state. After six months in prison, Smith and the church leaders were permitted to leave the state of Missouri.

The third site of the Mormon community was a town on the Mississippi River north of Quincy, Illinois. Church leaders purchased the site in 1839, and Smith changed the name of the town from Commerce to NAUVOO, which he said derived from the Hebrew word for "beautiful." The new Mormon settlements came to embody the church's continuing growth and Smith's search for security in what seemed a perpetually hostile world.

As the Mormon settlements grew, enlarged by natural increase and the arrival of Mormon converts from England, the population swelled from 1,000 in 1839 to more than 10,000 in 1844. By 1845, Nauvoo was one of the largest cities in Illinois. In addition to economic prosperity, these numbers gave Smith a degree of political power. With the Whigs and Democrats evenly balanced within the state, he used the voting bloc of the Mormons to bargain for the security of the church community. The state legislature voted the Mormon community a special charter, the so-called Nauvoo Charter, which seemed to give the community, its city, and its leaders special privileges and rights. These rights included a university, founded in 1844 although never actually organized. Smith was elected mayor of Nauvoo in 1842, and the governor of Illinois appointed him a lieutenant general in the state militia. With state arms, Smith enrolled and trained the Nauvoo Legion, a carefully selected body of men whose training, discipline, and zeal was reassuring to members of

the church community and threatening to outsiders. This series of events culminated in spring 1844, when Smith announced himself a candidate for president of the United States.

As the community grew in numbers and political and military power, Smith's revelations brought new theological directions for the church. Among these were the baptism of the dead, so that all might have the benefit of a church baptism. In conjunction with these revelations, Smith ordered the construction of a temple. Amidst distinctive religious rituals that became part of the church doctrine, rumors again circulated that church leaders sanctioned and, indeed, practiced polygamy. These rumors generated a strong degree of dissent within the church itself.

In spring 1844, a group of estranged members of the church published a single issue of a newspaper that exposed polygamy and other practices by church leaders. Smith called a special meeting of the town council, declared the newspaper and its press a public nuisance, and ordered the press destroyed. The dissident leaders sought refuge outside the Mormon settlements and charged Smith with arson. After his safety was guaranteed by the governor, Smith surrendered and was imprisoned with other church leaders at Carthage, where he was to stand trial. On June 27, 1844, a mob broke into the jail and shot Smith and his brother Hyrum. The death of the church's founder and prophet closed the first crucial period in the church's history.

Among the leaders who sought to follow Joseph Smith as the church's leader, BRIGHAM YOUNG was the logical choice. He took charge of a community in mourning over the death of their founder and prophet, divided internally over the issue of polygamy, and under physical assault from the outside. As soon as he received the sanction of the Quorum of the Twelve Apostles (a committee of senior Mormon leaders), Young displayed the remarkable qualities of leadership that he would bring to the church over the next 30 years. He first sought a truce to stave off further mob violence and attempted to negotiate an orderly departure of the church from Nauvoo, but he was only partially successful. Even as he and other church leaders prepared for an emigration to the West, the Mormon settlements in Nauvoo were under attack from the surrounding countryside. Invading mobs burned homes and pillaged what they did not burn. In winter 1846, the Mormons fled across the river and headed west to a new and as yet undisclosed location.

After crossing the state of Iowa, the Mormon migration paused for a year in Winter Quarters (near Omaha, Nebraska). Here, Young and other leaders prepared the organization of a large encampment of church members near Omaha and began to lay plans for an emigration of the church into the distant Inter-Mountain West.

The first wagon company, led by Young himself, departed Winter Quarters in the spring of 1847 and reached the Valley of the Great Salt Lake in July 1847. Here, Young declared that the valley was to become the site of the future City of Zion. What followed was the systematic immigration of the church from Winter Quarters to the Valley of the Great Salt Lake, a process that lasted two years. Even then, later emigrations across the plains (some in the form of “hand cart brigades”) took place for another decade.

Within what was to become the state of Utah (although Young initially called it the STATE OF DESERET), Young systematically organized the Saints into a theocracy that controlled land, water, and other natural resources. When the federal government organized Utah Territory in 1850, Young was appointed governor. However, the federal judges appointed to the territorial court were non-Mormons, and they feared the theocracy that surrounded them. The hostility against the Mormons received fresh impetus in 1852 with the announcement that polygamy, practiced in secret by certain church leaders, was indeed a fundamental belief and practice within the church.

The open avowal of polygamy began a half-century of conflict and hostility between the church and the rest of the nation. Mormons saw the practice as a normal custom and their right as a chosen people headed by a farsighted prophet, seer, and revelator. To non-Mormons, the practice of plural wives was a violation of every tenet held by 19th-century America.

The sense of the Mormons as living in violation of the laws of the nation reached its climax in 1857, when President James Buchanan dispatched units of the U.S. Army to Utah to suppress what he regarded as a rebellion. At the same time, he removed Young as governor of the territory. Aware of the impending arrival of federal troops, the Mormon community began defensive preparations for an armed conflict. In this tense climate, Mormons and Indians attacked a wagon train at Mountain Meadows in southwest Utah. Some 120 men, women, and children died in what came to be called “The Mountain Meadows Massacre.” Young, who had originally ordered the wagon trains to pass in safety, did little to bring the perpetrators to justice, preferring loyalty to the church to a public exposure of the church members involved in the attack. Twenty years later, the federal government tried and executed John D. Lee, a Mormon leader and Indian agent, for the crime.

The federal army occupied parts of Utah, in what historians call the Utah War. Young decided not to oppose the invading expedition by force. Instead, he burned forts and towns and destroyed crops in hopes of delaying the army’s advance. Eventually, the two sides reached a degree of mutual accommodation. In 1858, the federal government pardoned Young for offenses, and the army gradually

retired, with the last of the forces leaving Utah on the outbreak of the Civil War.

The rest of the nation now turned its attention to the great war that divided it, and Young and the Mormon community turned their attention to growth and consolidation. Missionary efforts, an integral part of the church since its founding, revived and expanded. Converts from the East and from Europe (especially Great Britain) poured into Utah, whose church settlement had expanded across hundreds of miles, as far distant as Arizona and Nevada. When Brigham Young died in 1877, Utah’s population was 145,000, almost all members of the church community. In this prolonged period of independence, the institution of polygamy developed without internal or external opposition to become an accepted part of the church.

Mormon economic affairs also prospered. The agricultural enterprises associated with arable land irrigation grew and expanded, viewed throughout as arms of the church. Economic activity at all levels revolved around the church and church leaders. The joining of the Union Pacific and Central Pacific Railroads at Promontory Point, Utah, in 1869, ended Utah’s isolation from the rest of the nation. Thereafter, groups in Congress and the federal government were to launch a growing campaign of restrictive legislation against the church. These acts and court decisions against polygamy and the Mormon economic domination of the territory led to a series of compromises and Utah’s eventual admission to the Union in 1896.

## cities and urban life

During the first half of the 19th century, American cities differed substantially from their European counterparts. The process had begun long before, when the cities were planned without the protective walls, highly structured street systems, or charters that characterized European cities. Instead, 19th-century American cities developed as independent entities. The differences intensified as U.S. cities transformed themselves from trade and commerce centers with limited populations to ever-expanding arenas of public services, economic growth, and fluid populations that reflected the influx of foreign and rural immigrants. This unprecedented growth stimulated the expansion and maturation of the United States as a cohesive and extensive nation with significant urbanized centers that arose relatively quickly. It also laid economic foundations for the country to function as an industrial power despite the

upheaval, displacement, and population losses of the Civil War period.

For the first years of the 19th century, the urban population of the United States remained relatively stable. Cities such as Boston, New York, Philadelphia, and Baltimore were, as they had been since colonial days, East Coast port cities situated on major waterways with populations of under 100,000. They generated their commerce by shipping raw materials to European countries and receiving their manufactured goods in return.

But beginning in the 1820s, U.S. cities experienced unbroken growth that would last for a century. In large part, the source of this increase was large-scale immigration. By the mid-19th century, 5 million Irish, German, English, and other Europeans entered the United States. Between 1820 and 1850 alone, the combined population of Baltimore, Boston, New York, and Philadelphia climbed to 1.2 million people. Moreover, western cities such as Pittsburgh marked an inland urban expansion and the population of urban areas overall increased as towns with populations of 8,000 or more grew by 36 percent. Between 1830 and 1840, the total urban population grew from 0.9 million to 1.5 million people, and by 1850, close to 15 percent of all Americans lived in urban areas. Consequently, most urban centers of the North had been gradually transformed into important hubs of commerce and manufacturing, but with a concomitant price in terms of socialization. Gone were the days of small village life where inhabitants knew their neighbors; now city dwellers confronted a never-ending *mélange* of strangers in their midst. Lacking a sense of overall community in the city, most people retreated to smaller comfort zones based mostly on race, class, religion, or ethnicity. On the upside, the sheer size of the city environment gave young men and women a degree of freedom from parental supervision and community watchfulness heretofore unthinkable in smaller settlements. Basic distrust of people was fast becoming a facet of everyday urban life, and contemporary moral reformers were quick to point out that cities had become hotbeds of licentiousness, danger, and vice.

An early fixture of 19th-century U.S. urban life was industrialization, seen initially in the adaptation of steam power for mechanical use. By mid-century, the power used to drive steamboats 30 years earlier was running factory machines. This development freed business owners from situating factories along abundant water supplies. Instead, industries could follow the population and be established near popular transportation hubs. As technology improved and became more cost effective, it enabled new links to arise between urban centers and the interior, which in turn fostered greater economic growth and prosperity. Chicago, Illinois, is the most dramatic example. By the construction of a canal in 1848 and rail lines throughout the 1850s, it had

become a major hub of the lumber, cattle, and agricultural industry. Southern cities such as Memphis, Tennessee, and Atlanta, Georgia, once hooked into the railroad infrastructure, also experienced similar growth patterns for identical reasons.

Technological advances helped to transform city transportation and extend the city's geographic reach. They opened the city beyond the bounds of those who could walk within it to include anyone served by a public transport system. To move the growing numbers of residents living far away from work and entertainment, inventions such as the horse-drawn omnibus and trolley became popular. Introduced in the 1830s, the omnibus was a horse-drawn roofed wagon that carried over two dozen riders. More successful as public transportation was the horse-drawn trolley, a conveyance holding dozens of riders that ran along railroad tracks installed flush with the street. So well-fitted to city life were trolleys that they remained in service into the mid-20th century. This same technology also spawned the rise of suburbs by consigning the inner city to the poor and newly arrived, while more affluent families withdrew from the confusion and bustle by commuting on trains or trolleys. Real estate developers consequently flexed their political muscle with local legislatures to secure charters for municipal improvements in the form of strategically placed streetcar lines, designed to lure middle- and upper-middle-class residents to settle in upscale subdivisions on the urban periphery. Thus, most cities began reshaping their demographic landscape along transportation routes featuring distinct commerce, housing, and manufacturing sectors.

From the late 1820s, railroads served an increasingly important role in providing inter- and extraurban transportation. They linked cities and towns across the United States, and as the century progressed, cities devoted considerable funds to their creation. In many cities, railroad construction was underwritten by transportation bonds. Other forms of transportation were less well advanced. Plank walkways were only occasionally available for pedestrians; roads were unpaved.

Advanced technology and necessity were combined to develop urban commercial and residential housing. To accommodate increasing urban industry in limited city space, architects and city planners tried to find ways to build upward. In the late 1840s, inventor James Bogardus developed a cast-iron support process for buildings; by the 1850s, this form of columnar support allowed for the construction of multistory buildings. Elevators would also lead to the increased construction of multistory buildings. Once inventor Elisha Otis had improved their design to incorporate safety features, elevators became particularly useful to construction in the 1850s and afterward.

Such advanced housing was unavailable for most mid-19th century urban dwellers. Instead, one- and two-story

Broadway in New York City, 1855 (Hulton/Archive)

buildings, divided into small apartments, provided much of the housing. Inadequate in size and number for the many thousands of new city dwellers, these low-rise apartment houses resulted in severe overcrowding. Several dozen people might share a room meant for a few, and all parts of a building were used for shelter. In New York City in 1850, over 28,000 people lived in cellars. In response to the public-health risk posed by apartment overcrowding, some cities passed reform legislation. An early New York law was passed in 1860, mandating that apartment buildings have fire escapes.

Information exchange became increasingly important to maintaining order within a city, and it was achieved in large part through the large-circulation penny paper. While at the beginning of the 19th century, newspapers were primarily six-cent periodicals underwritten by a political party and sold by annual subscription, the penny paper was sold on the streets by newsboys and was supported by commercial advertising. Unlike its predecessors, the penny paper often declined to promote political ideologies and attempted objectivity and up-to-date reporting of events. The combination of news and objectivity proved highly

popular among immigrants, laborers, and the middle class, resulting in an increase in the number of daily and weekly penny papers from 715 to 1,279 between 1830 and 1840 alone. Notable penny papers included the *New York Herald*, *New York Sun*, and *Baltimore Sun*.

For profit, prestige, and civic-mindedness, cities supported various types of entertainment, including libraries, theaters, concert halls, and outdoor entertainment palaces, which were very popular. Impresarios such as P. T. Barnum imported European artists, such as operatic singer Jenny (the “Swedish Nightingale”) Lind for U.S. tours. Such displays of high artistic enjoyment increased the overall perception of the United States as an increasingly sophisticated nation.

While 19th-century cities improved their stature by attending to their arts and industries, they also faced wide-ranging and daunting problems of public health. For example, the average New York street was overrun with swine and manure; a former New York mayor called the city a “pigsty.” Disease was also a major problem. With tens of thousands of people sharing the same water supply and refuse system, and ships from across the world

arriving daily at port cities, contagious diseases spread quickly. A cholera epidemic occurred in New York City and Newark (New Jersey), Cleveland, Chicago, and other cities in 1832; in 1849, another cholera epidemic occurred when the disease spread from New Orleans to St. Louis and through the middle and eastern United States. Other epidemics during the period included smallpox and cerebral meningitis.

Establishing public services to alleviate these problems became a major concern for 19th-century cities. Eighteenth-century cities had distributed funds for basic uses such as street and public building maintenance and as alms to the poor, but the more diverse and populous 19th-century city required a broader range of services. Among them were schools, public works, transportation, public health services, and government administration.

For example, creating a waterworks for a city was a primary, extensive endeavor. The New York tunnel system, which extended 50 miles to the upstate Croton reservoir, took several years to build, from 1835 to 1842. Dozens of citywide water systems were built by the end of the 1850s. Funding them, as well as other public works projects, sometimes involved federal, state, and city government funds. In one successful partnership, the U.S. Army and city governments cofunded various harbor and river projects, such as the Chesapeake and Ohio Canal in the mid-Atlantic region.

Similarly, crime-control units began to be expanded and developed during the mid-19th century. They were transformed from plainclothes night-watch groups into uniformed police departments. In addition, they were now designed to take a more active role than they had in the 18th century. Instead of simply responding to crimes, the 19th-century police force was expected to uncover and prevent crime. New York City became the first to have a department of regularly uniformed policemen in 1856. Similarly, government-controlled fire-fighting departments were being developed, if not yet implemented, during the mid-19th century. Created in part to replace the various groups of volunteers and private subscription companies, some of whom belonged to warring ethnic groups and gangs, the forces were also established to provide fire coverage to property owners and businesses.

Providing citywide public education was another concern for mid-19th century cities. Because cities such as New York had a large percentage of foreign-born students, educators and public policy planners viewed public education as vital to developing an able workforce and patriotic citizenry. As common school reformers like HORACE MANN and Catharine Beecher viewed it, schooling was both practical and idealistic. It would prepare U.S. citizens for an increasingly industrialized society and would decrease social unrest.

City planners and members of government viewed the need for such public works—for water, transportation, housing, crime control, EDUCATION—as crucial. Their thinking led to the transformation of city government into an active force. While at the beginning of the 19th century, city government depended on regulations to be devised as problems arose, the mid- to late-century city was marked by active government involvement, including civic promotion, health campaigns, and financial incentives. In the years after the Civil War, city governments would become more responsive, even as they fell under the control of corrupt political bosses.

To finance the increasingly expensive city, legislators in the 19th century granted cities the power to levy taxes. Property taxes became a major source of city funds; other sources included fees, fines, and property sales. Western cities also financed themselves by issuing bonds to established European countries or eastern U.S. cities, while some new cities and villages were formed through a process of general incorporation. A popular entrepreneurial effort, incorporation of a city, allowed founders to seek private investments and government loans.

As the 19th century reached its midpoint, some changes in cities were evident. New York City, with its favorable coastal position, large harbor, and proximity to the Hudson River, was the commercial and information center of the East Coast, surpassing larger, 18th-century rival Philadelphia. In the Midwest, the dominant city of 1840 was St. Louis, with its central frontier location and population of 16,469. During the 1860s, it would be challenged and eventually overtaken by the port-and-market center city of Chicago, whose population would increase 60-fold between 1840 and 1870. Although southern cities did experience some effects of industrialization and increased immigrant population, they grew at slower rates. Important 19th-century southern cities included Birmingham, Memphis, and New Orleans.

By mid-century many city planners had begun deliberately reserving urban space for parks and other development-free zones in which residents could temporarily escape from the humdrum of everyday life. In New York, the best example is Central Park, which arose in 1858 and served a dual purpose; middle-class inhabitants sought out its balmy openness as a natural haven to relax in, while the lower classes utilized it as a recreational area to play sports and release pent-up energies. In either case, most metropolitan areas in America began setting aside space with a view toward granting the relentless urbanizing onslaught a human face.

In 1853 the nation's largest city hosted its largest promotional event, the New York Crystal Palace Exhibition. Modeled on London's 1851 Crystal Palace Exhibition, it was meant to mark New York's status as a cosmopolitan center

on a par with London and promote the nation's industrial accomplishments and public entertainments. Although it lasted for more than two months, attracted a million visitors, and collected over \$330,000, it was considered a failure by its promoters, lacking the international representation and prestige of London's Crystal Palace exhibition of 1851.

The fair may have been considered a disaster, but its size, examples of industry, and mass of people reflected the complexities of the contemporary U.S. city. Throughout the 19th century, U.S. cities would grow in size and population, become repositories and generators of American inventions such as the elevator and telegraph, and become home to industries such as steelmaking and textiles. Public entertainments would develop, and U.S. cities would continue to showcase themselves at even more elaborate expositions like the Centennial Exposition of 1876 and the World's Fair of 1904. Although in 1860, 80 percent of Americans still lived in farms or villages, the move toward widespread urban life was well underway.

**Claiborne, William C. C.** (1775–1817) *government official*

A territorial official and the first governor of the state of Louisiana, William Charles Coles Claiborne helped to bring the Louisiana Territory into the Union. Descended from an old Virginia family, Claiborne was born in Sussex,

Virginia, in 1775. Through his family connections, he was appointed at the age of 15 as a clerk to Congress and soon thereafter began to study law. He later moved to Sullivan County, Tennessee, where he established a legal practice. Like many lawyers on the frontier, Claiborne gravitated to politics, and when Tennessee (territory southwest of the Ohio) sought admission to the Union, he was a member of the constitutional convention. After Tennessee became a state in 1796, he was appointed to the state supreme court. While serving on this court, he was elected to the U.S. House of Representatives to fill out ANDREW JACKSON's term. Although Claiborne was not yet 25 years old and thus ineligible to serve in the House of Representatives, he nonetheless took his seat. In 1798 his constituents reelected him to the House.

In Congress, Claiborne headed the committee to investigate charges made against Governor Winthrop Sargent of Mississippi Territory. Residents of the territory had petitioned that the territory be advanced to the second stage, which would permit them to elect a legislature and send a nonvoting delegate to Congress. Claiborne's committee's report supported the petitioners. When the presidential election of 1800 ended in a tie between Thomas Jefferson and Aaron Burr, the decision was thrown into the House of Representatives. Claiborne voted for Jefferson, and his reward was an appointment as governor of the Mississippi Territory, succeeding Winthrop Sargent.

During his two years as governor, Claiborne demonstrated his political skills. He supervised the first elections in the territory and was remarkably successful in reducing the bitter political partisanship that was characteristic of Mississippi and other territories. The achievement was all the more remarkable since Claiborne had arrived as an outsider. When Jefferson bought Louisiana in 1803, Congress soon established the Territory of Orleans, and the president made Claiborne governor of the new territory. It was an important appointment, for he was representative of the national government to a political and social community that was generally not happy about coming under U.S. sovereignty.

Claiborne's early years in New Orleans were difficult, given that he was the representative of an alien government and he spoke no French. The president and Congress had chosen to give Louisianians a minimal share of self-government out of concern for the loyalty of the new region, and their actions made Claiborne's position even more difficult. The new government also imposed English as an official language and the English common law on the court system. Furthermore, the rigid enforcement of the customs duties after years of lax Spanish administration further angered the New Orleans trading community. However, Claiborne gradually won the trust of the citizens of New Orleans and the Territory of Orleans. He also married into a Louisiana

family and learned French. When Congress admitted the Territory of Orleans to the Union as the new state of Louisiana in 1812, Claiborne was elected its first governor.

Claiborne was a political leader of consummate personal skills. Even as an outsider in the territories of Mississippi and Orleans, he laid the foundation of trust and compromise. Yet the turmoil of the frontier at the opening of the 19th century demanded more aggressive solutions on certain occasions. Claiborne's first encounter with such new challenges was the behavior of General James Wilkinson and former vice president Aaron Burr in the series of events that would become known as Burr's Conspiracy. Claiborne's responses were slow and indecisive. The same difficulties reemerged a decade later during the threatened siege of New Orleans by the British in late 1814 during the WAR OF 1812. Claiborne's slow response to a British invasion force infuriated General ANDREW JACKSON and other American military leaders. Throughout these mishaps, Claiborne retained the loyalty and support of Louisianans. In 1817, at the close of his term as governor, the legislature of the state of Louisiana elected him to the U.S. Senate, but he died that year before he could take office.

## claim clubs

In the early decades of the 19th century, settlers who arrived in western lands (what is now the Middle West) ahead of government land offices established claim clubs, makeshift associations also known as claim associations or squatter courts, to protect themselves and provide order on the frontier. Each club usually assumed authority over an area the size of a township, settling disputes over land rights and, when no officers were present, enforcing general matters of law and order.

Although these clubs were not, strictly speaking, legal entities, they proceeded as though they were sanctioned. By meeting, electing officers, and often forming constitutions, the clubs tried to reproduce political structures from settled regions of the United States. They grew out of the settlers' desire to protect their claims from the intrusions of other unofficial settlers and, especially, from wealthy speculators. Before the Preemption Act of 1841, anyone squatting on land prior to its public sale could be ejected by speculators. After the law was passed, squatting on surveyed lands was legal, and the squatter had the right to preempt his claim before public sale, thus circumventing the bidding power of the speculators. This law did not solve squatters' problems with speculators completely, since

many would-be claimants who wanted to preempt their claims lacked the funds to pay for the land up front. Thus, claim clubs mediated disputes between competing claimants and speculators as well.

Joining a claim club was a simple process. For one dollar, members of a claim club could register a claim with the association. Elected secretaries or registrars kept records of each claim. If more than one settler claimed a given piece of land, the club arbitrated the dispute through a five-member jury. Disputants could also appeal any jury verdict by consulting the entire membership. This procedure was designed to deal both with the powerful speculators and with another common problem in these newly settled areas: claim jumpers. Without the official federal presence necessary to decide who owned what, jumpers often attempted to claim land that had already been registered with the claim association by another party. In these cases, the association's elected marshal issued a verbal warning to the jumper. If this effort failed, the marshal and other members of the association would issue a "physical warning"—destroying a jumper's personal property and improvements or even physically harming the jumper. Sometimes these attempts to oust the claim jumper led to deaths. Even when clubs were unsuccessful in their attempts to expel a supposed claim jumper, they ostracized these outlaws from the community, refusing to do business with them.

Most common in territories such as Iowa, Nebraska, and Kansas, claim clubs often operated under different criteria than those authorized by federal land law. Against official policy, clubs allowed minors to make claims and allowed claimants to register more than the standard 160 acres. Clubs established a kind of order on the frontier designed to withstand the influence of more powerful outsiders. When public land auctions finally occurred, members of claim associations would mobilize to protect their gains from any rivals. Though only quasi-legal themselves, the organized claim clubs were able to persuade many speculators to leave them alone. At land auctions, squatters would gather around a designated bidder, who was supposed to bid the minimum government price for each claim. If any outsider or speculator tried to bid higher on the property, claim associates would intimidate him, sometimes physically. Any speculator who resisted this coercion could expect to be treated the same way claimants treated jumpers.

Claim associations provided a means through which squatters could register, transfer, and mortgage claims without the presence of the federal land office. The clubs promoted self-sufficiency and often developed into powerful speculative organizations in their own right. They also proved that in the absence of federal authority, settlers could govern themselves efficiently. The spirited philosophy of self-defense and self-government found among the claim clubbers influenced the way laws were formed in

these developing regions. State and territorial legislatures often validated the doctrines of the claim clubs, upholding the claims of settlers who came first and improved their land. While speculators wielded considerable power on the frontier, claim club ideals—mobilizing individuals to protect against outsiders—also exerted significant influence in the Middle West.

The establishment of claim clubs in frontier areas continued as standard practice until about 1870. Usually these clubs lasted only a few years, until federal officials took control. Although short-lived, the clubs were crucial to the formation of local communities and shaped the beliefs and attitudes of settlers determined to stake a permanent claim on the American frontier.

### Clay, Henry (1777–1852) *politician*

Henry Clay was an American statesman, secretary of state under JOHN QUINCY ADAMS, an unsuccessful candidate for the presidency in 1824, 1832, and 1844, and in 1850, the architect of an important compromise to preserve the Union. A representative for the border state Kentucky and spokesman for the middle-of-the-road WHIG PARTY, Clay sought to reconcile differences between the North and South on slavery. Clay also represented the nationalist outlook of the young, expanding Middle West. In support of the region's territorial interests, he boldly urged war with Britain in 1812. His AMERICAN SYSTEM political platform called for protective tariffs for eastern manufacturers, federal financing for internal improvements in the West, and a national bank as he sought to link the industrial East with the agrarian West.

Henry Clay was born on April 12, 1777, in Hanover County, Virginia, to a middle-class family. At the age of 20, after studying for the bar with the eminent George Wythe, Clay moved to Lexington, Kentucky, where he developed a thriving practice. He was blessed with a quick mind, a flair for oratory, and an ability to charm both sexes with his easy, attractive manner. That he loved to drink and gamble was no drawback in an age that admired both vices. Ambitious for worldly success, Clay married into a wealthy and socially prominent family and soon gained entry into Kentucky's most influential circles. While still in his 20s, he was elected to the state legislature, in which he served for six years, until 1809.

In 1810 Clay was elected to the U.S. House of Representatives, and from 1811 he served as Speaker of the House. As a spokesman of western expansionist interests and leader of the WAR HAWKS, he stirred up enthusiasm for war with Great Britain and helped bring on the WAR OF 1812. After a brief absence in 1814 to aid in the peace negotiations leading to the TREATY OF GHENT, Clay returned to Congress and began to formulate his “American System,” a national program that ultimately included federal aid for internal improvements and tariff protection of American industries.

While Henry Clay was not the author of the MISSOURI COMPROMISE, he was instrumental in facilitating its final form and passage through Congress. In 1818 the Territory of Missouri, which was part of the Louisiana Purchase, applied for admission to the Union. SLAVERY was legal in the Territory of Missouri, and about 10,000 slaves lived there. Most people expected Missouri to become a slave state. When the bill to admit Missouri to the Union was introduced, there were an equal number of free and slave states. The admission of Missouri threatened to destroy this balance. But during the next session of Congress, Maine applied for admission to the Union. Missouri and Maine could then be accepted without upsetting the balance between free and slave states, and the Missouri Compromise became possible.

The compromise admitted Maine as a free state and authorized Missouri to form a state constitution. The compromise also banned slavery from the Louisiana Purchase north of the southern boundary of Missouri, the line of 36 degrees 30 minutes north latitude, except in the state of Missouri. This compromise was not immediately acceptable to all parties, especially those in Missouri Territory. Working hand-in-hand with Senator John Holmes of Maine, Clay ironed out the wrinkles, and in 1821 he pushed the amended Missouri Compromise through Congress.

In 1828 Clay again supported Adams for president, but Jackson won the White House. Three years later, Clay was elected to the U.S. Senate and led the National Republicans, who were beginning to call themselves the WHIG PARTY. Hoping to embarrass Jackson, Clay led the Senate opposition to the president's policies, but when the election came, Jackson was overwhelmingly reelected.

Around this time, a crisis developed over tariffs. South Carolina's nullification of the tariffs of 1828 and 1832 as well as Jackson's threats of an armed invasion of that state allowed Clay to gain political ground. Working, even at the cost of his own protectionist views, toward a compromise with the faction led by JOHN C. CALHOUN, he helped to promote the Compromise Tariff of 1833.

As a candidate for the presidency in 1824, Clay had the fourth-largest number of electoral votes. With no candidate having a majority, the election was decided in the

House of Representatives. Clay released his electoral votes to John Quincy Adams in return for Adams naming Clay secretary of state. Adams won the election by a one-vote margin. The deal struck between Adams and Clay became referred to as the “corrupt bargain,” and many thought Jackson had been “robbed” of the presidency. The public outcry was strong, and the stigma of the “corrupt bargain” would haunt Adams’s presidency and be instrumental in his serving only a single term. It would also be an impediment to Clay’s future political fortunes.

In December 1831 the National Republicans once again nominated Henry Clay for the presidency. Clay returned to the national spotlight feeling pessimistic about his chances of defeating Jackson. He therefore made his primary goal to bring a measure to Congress that would put the administration in an embarrassing position. Clay proposed a modification of the tariff. This would have reduced revenues and put off Jackson’s intended repayment of the national debt by nearly a year. If Jackson vetoed it, he would alienate northern states, like Pennsylvania, whose votes he needed. If he signed it, it would alienate Jackson’s southern supporters. In the end Clay’s strategy failed when Congress passed a bill moderate enough to enable Jackson to sign it without alienating either faction.

Clay opposed the Jackson regime at every turn, particularly on the issue of a national bank. When, in 1833, Jackson had the deposits removed from the SECOND BANK OF THE UNITED STATES to various other banks, Clay secured a Senate resolution censuring the president.

In 1840 Clay lost the Whig nomination to WILLIAM HENRY HARRISON, but Clay supported him. When Harrison was elected, Clay was offered the post of secretary of state, but he chose to stay in the Senate, where he planned to reestablish the Bank of the United States. However, the unexpected accession of JOHN TYLER to the presidency upon the death of Harrison less than a month after taking office, and Tyler’s vetoes of Clay’s bills, caused Clay to resign his Senate seat in 1842.

In 1844 Clay ran for president against JAMES K. POLK, an avowed expansionist. Earlier Clay had publicly opposed the annexation of TEXAS. During the campaign, however, he modified his position, agreeing to annexation if it could be accomplished with the common consent of the Union and without war. This shift probably lost him New York State, with which he could have won the election. His failure was crushing for him and for the Whig Party. In 1848, his party refused him its nomination, feeling that he had no chance, and his presidential aspirations were never fulfilled.

Slavery had been given limits by the Missouri Compromise of 1820 and for some time there was no opportunity to overstep those limits. However, the new territories made renewed expansion of slavery a real likelihood. After the

MEXICAN-AMERICAN WAR, Texas, which already permitted slavery, naturally entered the Union as a slave state. But CALIFORNIA, New Mexico, and Utah did not have slavery, and when the United States prepared to take over these areas in 1846, there was great sectional conflict on what to do with them.

Southern opinion held that all the territories had the right to sanction slavery. The North asserted that no territories had that right. In 1848, nearly 300,000 men voted for FREE-SOIL PARTY candidates who declared that the best policy was to contain and discourage slavery. The Midwestern and border-state regions (Maryland, Kentucky, Missouri) were even more divided, however, with many favoring popular sovereignty as a compromise.

After being reelected to the Senate in 1849, Henry Clay denounced the extremists in both North and South, asserted the superior claims of the Union, and was chiefly instrumental in shaping the COMPROMISE OF 1850. It was the third time that he had stepped forward to avert a breakup of the Union in a crisis, and thus he has been called the Great Pacificator and the Great Compromiser.

The key provisions of the compromise were: California was to be admitted as a Free-Soil state; that the remainder of the new annexation be divided into the two territories of New Mexico and Utah and organized without mention of slavery; that the claims of Texas to a portion of New

Henry Clay (*Library of Congress*)

Mexico should be satisfied by a payment of \$10 million; that more effective machinery be established for catching runaway slaves and returning them to their masters; and that the buying and selling of slaves (but not slavery itself) be abolished in the District of Columbia. For the last time, Henry Clay had been instrumental in pacifying the growing sectional unrest. The country breathed a collective, albeit temporary, sigh of relief.

Clay was not to live much longer after the passage of the compromise. He spent the summer of 1851 at Ashland, where he made his will, providing for the disposition of his estate and the freeing of his slaves. Though dying of tuberculosis, he returned to Washington that fall and answered the first Senate roll call. Thereafter he was closely confined to his room in the National Hotel, where he died on the morning of June 29, 1852.

### Clayton-Bulwer Treaty (1850)

The Clayton-Bulwer Treaty was an agreement between the United States and England to cooperate in the construction of any canal through Central America to link the Atlantic and Pacific Oceans. The end result of the treaty may have been to delay construction of an isthmian canal for more than 50 years. Nevertheless, in 1850 it represented an important diplomatic triumph for the United States since it forestalled British expansion in Central America and recognized the United States as equal to the more powerful British in the region. At the same time, however, it meant that American settlers in CALIFORNIA and Oregon had to wait many years for improved transportation links with the East.

During the period of American conflict with Mexico, both the United States and Britain made significant moves to enhance their position in Central America. In the 1840s, the most favored route for a potential isthmian canal went through Nicaragua. From their colony in British Honduras (Belize), the British asserted a protectorate over the Mosquito Coast (the Atlantic coast of Nicaragua), the most likely Atlantic starting point for a canal. Later, in 1849, they also temporarily occupied Tigre Island near the most likely Pacific terminus for a canal through Nicaragua. The United States had not been idle in Central America, either. Democratic president JAMES K. POLK's administration negotiated and signed two treaties with Latin American countries which would affect any canal-building effort. The first, the Bidlack Treaty (1846) with Colombia, gave

the United States exclusive rights to build a canal via what was then the second most desirable route, the Colombian province of Panama. In exchange, the United States guaranteed Colombian control over the province and the canal's neutrality in times of war. The second treaty, this one with Nicaragua, offered the United States exclusive control over a Nicaraguan canal in exchange for guarantees of Nicaraguan sovereignty.

The OREGON TREATY OF 1846, the MEXICAN-AMERICAN WAR, the CALIFORNIA GOLD RUSH, and the consequent flow of settlers to Oregon and, especially, California increased both American and British interest in Central America and a possible isthmian canal. In the United States, a canal was increasingly popular with shipping magnates such as CORNELIUS VANDERBILT who sought to control trade with the West Coast. Central America was also attracting the attention of southern politicians who saw the region as potential slave territory to offset the free-state advantage gained in California and (later) ratified in the COMPROMISE OF 1850. Meanwhile, the British sought to maintain their dominant position in the Caribbean, a position that would be threatened by American control over an isthmian canal. The British also wanted to participate in the trade of the Pacific coast of the United States.

Thus, both the United States and Great Britain had interests in Central America and had reasons to be concerned about the other's moves in the region. Accordingly, conditions were favorable for a resolution of potential conflicts. During the Whig presidency of ZACHARY TAYLOR, Secretary of State John Clayton sat down with the new British ambassador to the United States, Sir Henry Lytton Bulwer, to resolve the disputes over Central America. The resulting treaty guaranteed both countries a role in any canal by denying either exclusive rights to any canal route. It also committed both to the neutrality of any canal and to policies of founding no new colonies and building no new fortifications in Central America. The treaty was ratified by the U.S. Senate on May 22, 1850.

Apart from the provisions relating to a possible isthmian canal, other provisions of the Clayton-Bulwer Treaty were violated almost immediately. Britain refused to surrender its protectorate over the Mosquito Coast, which the United States believed fell under the provisions of the treaty. More egregiously from the American perspective, in 1852 the British fashioned the Colony of the Bay Islands out of islands in the Bay of Honduras. For their part, the British were angered in 1856 when Democratic president Franklin Pierce recognized the government in Nicaragua established by American adventurer William Walker; though he disavowed any aim to join the United States, Walker seemed to be aiming for annexation. In the long run, these treaty violations came to little. The British gave

up the Mosquito Coast and the Bay Islands in 1859 and 1860, and Walker's government was destroyed in 1857.

Finally, although the requirement of American and British cooperation in the construction of any canal seems to have made it more difficult to build a canal, an isthmian canal project was probably beyond the capabilities of mid-19th-century technology and science—as the French tragically discovered in Panama in the late 19th century when disease decimated their work crews. Nevertheless, the Clayton-Bulwer Treaty remains an important landmark in U.S. diplomatic history, with important consequences for westward expansion.

### Colorado gold rush

The name generally given to the surge of people across the Great Plains to Colorado in the summer of 1858 was the Colorado gold rush, whose predecessor was the CALIFORNIA GOLD RUSH a decade earlier. The response to the discovery of gold in Colorado was just as intense as that in CALIFORNIA, but the location and the circumstances made for a varied outcome.

In the aftermath of the discovery of gold in California in January 1848, the search spread across the breadth of the American West. Surely the riches of the Golden State lay in other locations just awaiting the enterprising prospector, or so ran the argument. In July 1858 a party of prospectors, led by William Green Russell, camped near the mouth of Cherry Creek and the headwaters of the South Platte River, where they found placer gold in modest quantities. Russell's report of the find exaggerated the richness and range of the discoveries, but America had long awaited another California bonanza, and news of their discoveries precipitated a flood of immigrants across the plains to the new diggings. The imagined Colorado goldfields were only 700 miles from Independence, Missouri, so the Colorado gold rush drew most of its participants from the eastern United States.

The so-called Pike's Peak rush in 1859 generated an enthusiasm and a movement of people not seen since 1849. Perhaps as many as 50,000 crossed the plains that summer, and some have estimated a higher number. The immigra-

tion created a mining culture in the town of Denver and in the camps farther into the Rockies, with boisterous and optimistic crowds intent on the prospect of wealth. The rush to Colorado had an early impact on the landscape of the plains and the lives of the Plains Indians. Heretofore, various groups of Indian peoples had largely escaped the impact of Euro-Americans on the West by accidents of geography and landforms. The tens of thousands who rushed to California had following the well-worn CALIFORNIA TRAIL along the Platte River Valley, and they pressed rapidly across the plains, intent on reaching the crest of the Sierra Nevada before the early snowfalls. The rush to Colorado in 1859 followed the Platte River and several alternative routes, arriving in the staging area around present-day Denver. The large numbers and the variety of routes meant extensive contact with Indians. On the dry plains, the Colorado argonauts found themselves in competition for the same natural resources as Indians, especially water, grass, and shelter. This competition for scarce resources produced inevitable conflicts.

Something in the order of 50,000 men (and a few women) reached the site of the new bonanzas in the spring and summer of 1859. In the traditional proportions that had emerged in California, about the half of the arrivals headed for the gold diggings; the other half turned their attention to the many ways of profiting from the miners. These included supplies, transportation of men and supplies to the gold camps, entertainment in all its various forms, and the many professional opportunities available to doctors, lawyers, and others.

The mining enterprise itself followed a cycle much like that in California, but accelerated in time. During the first season, miners wielded the pick, pan, and shovel in washing gravels, work routines familiar to their predecessors in California. Soon, however, prospectors found rich leads of gold ore that demanded more systematic and complex mining techniques. The Colorado gold rush soon passed from individual mining to larger operations requiring large capital investment and the latest in metallurgy techniques. Entrepreneurs soon built smelters in Denver to process the ores from the richest of the quartz leads. And, as in California and the more recent COMSTOCK LODE, mines began to burrow underground, following the gold leads as they sank farther and farther from the surface.

The immigration experience in the Colorado gold rush was markedly different from that of California. Because of the abbreviated distances, the prospective 59ers (as they were soon called) could return to the East. Many of them did; this was in the nature of mining enterprise. But the ease of return meant that miners could move back and forth almost seasonally. This continuous movement across the plains over the half-dozen years after 1858 further disrupted the lives of NATIVE AMERICANS. The Colorado gold

rush began a period of continuous conflict on the plains, with the reinforcement of racial stereotypes that had long characterized contact between the two groups. In November 1864, in a campaign that reflected continuing racial hostility set in a context of the American Civil War, Colonel John M. Chivington led a force of 1,000 territorial volunteers in an attack on a Cheyenne camp at Sand Creek. The massacre of some 400 Indian people, who had been confident of the government's benevolent protection, was the climax to a continuing conflict begun by the great immigration to Colorado in the summer of 1859.

In these early years, the center of Colorado's mining enterprise was William Green Russell's original settlement on Cherry Creek. In 1860, the little mining town merged with Auraria, its main rival. The following year, the consolidated town was incorporated with the name of Denver. This collection of log houses, false storefronts, and a modest tent city would become the commercial center of the Colorado gold rush and most important city in the West between Kansas City and San Francisco. Its success was owed to effective promotion, continuing mineral production in Colorado, and, beginning in 1859, the presence of a newspaper, the *Rocky Mountain News*. Denver was initially a supply center, later the site of industrial processes associated with mining, and finally a financial base. The important mining towns, farther in the mountains, were Central City, Black Hawk, Georgetown, Silver Plume, and Idaho Springs. Most of the significant early mining was in Gilpin County.

Early Colorado mining camps drew their institutional form from California camps. With the organization of the territory some years away and the conflicts and tensions created by large numbers rubbing elbows and jockeying for a claim in shallow narrow streams, the miners soon formed districts and established rules to preserve order and to provide for the adjudication of disputes. Without formal structure for order, the miners established their own miners' courts and enforced a high degree of order. As in other camps, foreigners and non-English speakers were at a disadvantage, but unlike the California Gold Rush, the Colorado gold rush was not a world event; it attracted immigrants from the East Coast but few foreigners.

The Colorado gold rush provided the nucleus of a Euro-American population that offered the basis for organizing a territory. Town founders and promoters (who were generally the organizers) called the territory Jefferson Territory. Congress did not concur. Still, the initiative may have helped. In 1861, Kansas became a state, and soon thereafter, Congress created Colorado Territory, with the same boundaries as the present state.

Colorado's gold-rush country had every institution and facility that a prosperous El Dorado could provide—except the regular consistent production of gold. Gold leaders in quartz strata soon supplemented the placer mining of the

first summer. But the gold harvest from placer mining was low—some would even have said disappointing—and the development of an effective deep quartz-mining enterprise was handicapped by the difficulties of extracting from Colorado's quartz with the technology then available. Colorado minerals presented difficulties beyond the mining techniques of the day. The quartz camps hung on while the new generation of mining engineers—appearing on the scene for the first time—searched for solutions that would transform Colorado's mining into another California.

The final resolution of the issue was largely the work of Nathaniel Hill, a professor of chemistry at Brown University in Rhode Island. Hill began his work in Colorado in 1864—even as most of the placer mining in Colorado was ending—and he sent a quantity of Colorado ore to Wales, where it was examined in the most modern mining laboratory of the day. Based on the findings, Hill organized a smelting company in 1867 and then began construction on a new kind of smelter in Black Hawk. Hill's smelter, which went into operation within a year, helped to revive Colorado's declining mining economy. Ten years later, a larger smelter was built in Denver, which became the center of Colorado's smelting industry. Denver's dominance was notably assisted by the development of a railroad network that connected the distant isolated mining camps to the Mile High City.

### **Colt, Samuel** (1814–1862) *inventor of the repeating revolver*

Samuel Colt was a U.S. inventor most famous for his handgun, the Colt .45, and considered one of the first to use mass production techniques in America. He was born in Hartford, Connecticut, on July 19, 1814, the son of a successful fabric manufacturer. His mother died when he was seven, and Colt lived with various relatives during his early years, acquiring an imperfect education. However, even as a child he displayed great interest in and an aptitude for firearms and explosives. He was attending a prep school in Amherst, Massachusetts, in 1829 when, at the age of 13, he put on an impressive display of pyrotechnics on Ware Pond. However, his father decided he needed discipline, so in 1830 Colt accompanied the ship *Corvo* on a yearlong voyage to India. En route, while observing the mechanics of the ship's wheel and steering system, it occurred to him that the same principles could be applied to handguns. Thereafter, he spent many hours whittling a wooden model of what became his trademark legacy: the revolving pistol.

The concept was not entirely new or original; multibarreled weapons (or “pepperboxes”) had been in existence since 1813. However, Colt saw much greater practicality in employing a single barrel with a revolving cylinder. Such a mechanism promised much greater rates of fire than traditional, muzzle-loading handguns.

When Colt returned home in 1831, he dedicated his energies to having a working model of his device developed by local gunsmiths. To help raise money for the effort, he toured the country giving demonstrations of “laughing gas” (nitrous oxide), and in 1835 he applied for a U.S. patent on his pistol. That year he also traveled to England and France to promote his ideas, but with little success. It was not until the outbreak of the SEMINOLE WAR in 1836 that the military displayed any interest in his weapon. By this time, Colt had established the Patent Arms Manufacturing Company in Paterson, New Jersey, and he received a government contract for 100 weapons. Though crude, these functioned well in the swamps of Florida, and orders were received from the Texas Rangers, then engaged in a war of independence against Mexico. It was here that the high rate of fire and accuracy of Colt’s revolvers became immediately apparent. Part of Colt’s success was his system of manufacture, which was based entirely upon factory production, assembly-line procedures, and interchangeable parts, all of which facilitated both production and quality control. Despite this success, unfortunately, no future government contracts were forthcoming, and Colt liquidated his assets in 1842.

For the next four years, Colt applied his talents to creating a submarine battery (underwater mine) for the U.S. Navy, as well as a submergible battery system. The latter was instrumental in assisting SAMUEL F. B. MORSE to perfect his own telegraph cable. Fortunately, on the eve of war with Mexico, General ZACHARY TAYLOR dispatched Captain Samuel Walker to confer with Colt about producing more weapons. The result was a heavier, more refined weapon, the “Walker Colt,” which fired a .44 caliber ball and functioned as a standard sidearm throughout the conflict in 1846–48. However, lacking a factory of his own, Colt forged a partnership with Eli Whitney, Jr., to manufacture the new weapons at Whitneyville, Connecticut. His most significant weapon here was the Improved Holster Model, which was lighter and more manageable in the saddle. Over the next 20 years, an estimated 200,000 of this pistol were sold to military and civilian customers alike. In time, the fame of Colt weaponry spilled over into the civilian sector, where they became the most popular weapon during the conquest of the western frontier. Mass production brought down the price of individual weapons, thereby ensuring their availability to Americans of the middle and lower classes, who formed the bulk of settlers.

Buoyed by success, in 1856 Colt established a large manufacturing center at Hartford, Connecticut, where he

Samuel Colt (Library of Congress)

turned out continually improved versions of pistols and rifles in ever-increasing numbers. His endeavors made him a millionaire, while his factory employed some of the best-paid and most highly skilled workers in the nation. In 1860, when civil war seemed imminent, Colt introduced a new model handgun, the New Model Army Pistol, of which 200,000 were purchased. Colt, however, proved somewhat over-businesslike in his dealings as he unhesitatingly shipped several hundred of the guns to southern sympathizers in Richmond, Virginia, prior to the outbreak of hostilities. Thereafter, he was firmly in the Union camp.

Colt died of heart disease on January 10, 1862; although only 47, he had a net worth estimated at \$15 million at his death. Having become one of the most important arms manufacturers in American history, he had also wielded an indelible impact on the field of early mass production.

## Colt revolver

The Colt revolver takes its name from both its inventor, SAMUEL COLT, as well as its firing method. Featuring a revolving cylinder, which contained a separate chamber for each bullet, the revolver was one of the first handguns capable of firing multiple rounds without reloading.

Colt patented his first model in 1836. By all accounts, his early revolver was flawed in many aspects: difficult to load, prone to accidental discharge, and in danger of exploding if dropped. Regardless of his pistol's imperfections, Colt was a master salesman; he conducted a relentless marketing and public-relations campaign aimed at the military, government officials, the press, and potential investors.

Initially based in Paterson, New Jersey, Colt's first factory manufactured approximately 3,000 pistols and 1,500 other guns during its six years in operation. But high manufacturing costs and an inherently flawed design led to the failure of Colt's early venture. In 1849, however, his fortunes began to turn. After being granted a renewal of his patent, he developed a much-improved .31-caliber revolver. Until the legendary Colt .45 came along in 1872, the 1849 revolver sold 325,000 and stood as the best-selling handgun of its time.

While this gun marked a definite improvement over the initial revolver, its success was not due to quality alone. Gun culture exploded during the 1840s and 1850s. MANIFEST DESTINY—the ideology that posited Americans as a kind of chosen people with an inalienable right of conquest—proved the best marketing tool possible. The CALIFORNIA GOLD RUSH, the MEXICAN-AMERICAN WAR, and other westward-expansion movements played a significant role in the Colt explosion. But Colt's greatest advocates, the men who would embody the spirit of the American West, were the Texas Rangers.

Captain Samuel H. Walker, a commander during an 1844 clash between 15 Texas Rangers and nearly 80 Comanches known as Hays's Big Fight, recounted the battle in a letter to Samuel Colt and credited his revolver with the Texan victory. Walker and Colt began working together, resulting in design improvements and government contracts that proved highly lucrative for Colt.

What distinguished the revolver was, of course, its rapid-fire capacity. In earlier skirmishes, the Rangers were armed with single-shot guns. Riding on horseback, they found the guns easy to shoot but awkward to reload. Comanche and Apache warriors developed a fighting strategy based on the limitations of the Rangers' weaponry. They would mount an initial assault, using just a few fighters, during which the Rangers would discharge their weapons. Then, as the Rangers dismounted in order to reload, the Indians would converge in much greater numbers and overwhelm the Rangers before they were able to fire again.

Walker credited the Colt revolver with intimidating the Indians enough to halt their attacks on TEXAS settlements and negotiate a treaty. He also brought the revolver into widespread military use during the Mexican-American War, giving the Colt revolver its reputation for being the "Gun that Won the West." SAM HOUSTON, the first U.S. senator from Texas, lobbied President JAMES K. POLK and his secretary of war to arm every soldier on the American frontier with Colt's pistols.

Colt harnessed the power of the Texas publicity, incorporating engravings of scenes from Hays's Big Fight and other Texan tableaux into the design of his pistols. He used his success in Texas as a springboard from which to generate military sales both within the United States and abroad. By the time of the Civil War, Colt had become the weapon of choice for the U.S. military.

## Columbia River

Because of its location, the Columbia River played a vital role in the United States's expansion into the Pacific Northwest. Rising in southeast British Columbia, this river of southwestern Canada and the northwestern United States flows approximately 1,200 miles before emptying into the Pacific Ocean west of Portland, Oregon. After 465 miles, it enters the state of Washington, and thereafter forms the boundary between Washington and Oregon.

The Columbia pours the largest volume of water into the Pacific Ocean of any river in North America, and long before the Europeans arrived, the Native Americans fished it for salmon. The earliest archaeological evidence of human habitation in the Columbia River basin dates to 10,000 years ago. The earliest groups lived by fishing, hunting large mammals, and gathering plants for food. Cultures in the protohistoric and historic periods varied greatly along the river. On the lower Columbia, groups lived in large multifamily longhouses, while on the middle- and upper-river sections, people moved seasonally and lived in smaller groups. Native fishers took salmon at Willamette Falls on the Willamette River and at Kettle Falls on the upper Columbia. Celilo Falls on the middle river was the most important Native fishery. Thousands gathered there during the spring and summer fish runs to harvest chinook salmon and trade. In the early 19th century, Pacific Fur Company trader Alexander Ross called Celilo "the great emporium or mart of the Columbia."

The Columbia River first appeared on European maps in the early 17th century as “River of the West,” when the Spanish maritime explorer Martin de Aguilar located a major river near the 42nd parallel. Cartographers often labeled the “River of the West” as an estuary to the mythical Straits of Anian, or the Northwest Passage, and located it anywhere from the 42nd to the 50th parallel. In 1765, British major Robert Rogers called the river “Ouragon”—later spelled “Oregon” by Jonathan Carver in 1778—as a derivative name referring to the “ouisconsin” river in present-day Wisconsin. The first confirmation of its location came in 1775, when Bruno de Hezeta described a river estuary at the Columbia’s correct latitude. In May 1792, American trader Captain Robert Gray sailed across the bar in the first documented visit to the river and named it after his ship, the *Columbia*. In October that same year, British explorer George Vancouver sent Lt. William Broughton up the river more than 100 miles, and Broughton produced the first detailed map of the lower river. Meriwether Lewis and William Clark explored the river in 1805–06 for the United States. North West Company fur trader David Thompson made the first map of the full river in 1811–12. After the War of 1812, England and the United States jointly occupied the Columbia River Basin territory.

In 1811 JOHN JACOB ASTOR established the first fur trading post, known as Fort ASTORIA, on the mouth of the Columbia River. Britain’s Hudson’s Bay Company (HBC) established a fur-trading hegemony in the region and built a headquarters post at FORT VANCOUVER in 1825. HBC trappers and traders spread throughout the Columbia River basin and beyond, bringing furs back to Fort Vancouver for shipment to England. Americans returned to the region as settlers during the 1840s, when overland migrants came to the Columbia and Willamette River valleys on the OREGON TRAIL. In 1846, the Oregon Country south of the 49th parallel became U.S. territory by treaty with Great Britain. Oregon achieved statehood in 1859, Washington and Montana in 1889, and Idaho in 1890.

### Compromise of 1850

The Compromise of 1850 was a group of measures agreed to by northern and southern interests in Congress that imposed limits on the expansion of SLAVERY, but protected it where it already existed. After the MEXICAN-AMERICAN WAR and the TREATY OF GUADALUPE HIDALGO, the United States gained the territory north of the Rio Grande and south of the 49th parallel. The acquisition of new land rekindled the flames of animosity between northerners and

southerners over the extension of slavery into the West. This controversy was really a continuation of the problems first addressed by the MISSOURI COMPROMISE in 1820, which had temporarily settled the issue of which states within the Louisiana Purchase would be free and which slave. This new territory, however, was not part of Louisiana and thus did not fall under the 1820 agreement. Tensions over slavery had worsened since the Missouri controversy, as abolitionists launched their impassioned antislavery campaigns and new FUGITIVE SLAVE LAWS were passed that angered northerners.

In 1842 the U.S. Supreme Court had ruled that officials in free states were not required to enforce fugitive slave laws—enforcement of a law that involves more than one state should be a federal responsibility. With this ruling in mind, southerners pushed for the creation of a national fugitive slave law. Usually the southern slaveholder position relied on the rhetoric of states’ rights, but in this instance their economic interest in seeing runaway slaves returned outweighed their devotion to state sovereignty. At the same time, abolitionists were campaigning to end the slave trade in Washington, D.C., seeing this practice as especially offensive when committed in the capital of a democratic nation. Tensions were also rising on the border between TEXAS and New Mexico. Texas claimed almost half of what is now the state of New Mexico. The terms of Texas’s annexation to the United States permitted the territory to be divided into as many as five new states. Because Texas was a slave state, the acquisition of the new territory in New Mexico could mean the creation of yet another slave state. Concern over balancing the number of free and slave states made the problems between Texas and New Mexico a troubling development.

These three controversies—all connected to slavery and its future—angered southerners and northerners more than any problem since the Missouri controversy. Some southern states began to decry northern aggression and call for secession. Animosity was so great in Congress that representatives could not agree on a new Speaker of the House, and debates became shrill to the point of violence. Senator HENRY CLAY of Kentucky, the promoter of compromise in 1820, once again proposed a solution to save the Union, introducing eight proposals in the Senate in January 1850. The first six proposals were grouped in pairs, one favorable to the north, one to the south. In the first pair of proposals, California would be admitted as a free state while allowing the Mexico cession to be established without any restrictions on slavery. In the second, the border conflict between Texas and New Mexico would be resolved in New Mexico’s favor, while Texas would be compensated for its loss by helping the state pay off bonds it had issued when it was a republic (a plan that benefited the mostly southern bondholders). In the third set of proposals, the

slave trade would be abolished in the nation's capital, but slavery would remain legal there unless neighbor states Maryland and Virginia approved its abolition. The final two proposals eventually proved to be the most thorny and contradictory: Congress would have no jurisdiction over the interstate slave trade, while the last element of the proposal supported the creation of a national fugitive slave law.

Debate over Clay's compromise was prolonged and fierce. Senate leaders JOHN C. CALHOUN, DANIEL WEBSTER, and William H. Seward gave powerful speeches on the proposals. At the heart of their remarks was the basic conflict between states' rights and the preservation of the Union. Calhoun argued that the Constitution protected slavery and that states' rights were sacrosanct. Webster called for compromise, appealing to the idea of an American identity larger than any single state interest. In his desire to compromise, Webster accepted the national fugitive slave law. Seward rejected this compromise position. For him, slavery and compromise were both wrong. He appealed to the concept of a higher moral law, one that valued the liberty of all over the privileges of a few.

In the end, after exhaustive arguments, the compromise package that passed in the Senate resembled Clay's initial proposals closely. He had decided to group all the proposals in one bill, hoping the whole compromise would pass because senators and congressmen would vote for the parts of which they approved. The opposite happened: legislators mostly voted against the package because they opposed certain proposals within it. After months of hard work fashioning a solution, Clay was discouraged. Retreating to Newport for his health, he charged Senator Stephen A. Douglas with the task of defending the compromise. Douglas decided to shift tactics, separating the elements of the compromise into different bills and building coalitions to support each one. In July 1850 President ZACHARY TAYLOR died suddenly. Taylor had opposed the compromise, but the new president, MILLARD FILLMORE, approved of it. Fillmore's support, combined with Douglas's division of the proposals, led to the successive passage of the compromise measures in August and September of 1850.

Most legislators were pleased and relieved by the result, hoping the Compromise of 1850 would at last heal the divisions between North and South, but diehard partisans on both sides viewed the compromise as a betrayal. The results of the compromise were different than predicted: California and the western territories voted in favor of the South throughout the 1850s, and slavery would actually be legalized in New Mexico and Utah. But by far the most incendiary feature of the compromise was the passage of a national fugitive slave law, which allowed federal commissioners to issue warrants for fugitive slaves. Once runaways were captured, slaveholders came before the

commissioner to prove ownership. The standards of proof were minimal, and fugitives were barred from testifying. These slave-catching endeavors were paid for with federal money, and federal marshals were required to assist in the retrieval of runaways. Northerners who harbored fugitives or refused to help find them could be heavily fined or even imprisoned.

Abolitionists condemned the law for violating civil liberties and accused southern slaveholders of immorality and hypocrisy. After decades of promoting states' rights, southerners were relying on the power of the federal government to return their property. This self-serving shift, and the blatant abuses of the slave-catchers, angered some northerners who had never before considered themselves abolitionists. Most did not consider blacks as equals, but they were shocked by the violation of liberties they witnessed as the fugitive slave law was enforced. Some northern states passed personal-liberty laws in the mid-1850s and refused to help southerners recapture their slaves. Thus, the divisions between North and South actually increased as a result of the Compromise of 1850. The violent incidents and political hostility steadily increased over the next 10 years, leading eventually to southern secession and the outbreak of the Civil War in 1861.

## Comstock Lode

The Comstock Lode lies in the Carson Valley in northwestern Nevada, on the side of Mount Davidson, where the towns of Virginia City and Gold Hill would mark its presence. It runs two and a half miles across the eastern face of the mountain, with significant mineral veins as deep as 3,280 feet (1,000 meters) below the surface. Beginning in 1859, the mines and mining operations associated with the deposits of the Comstock Lode were to be among the most significant in the history of mining. Between 1860 and 1880 alone, Comstock mines produced more than \$300 million in gold and silver—the richest in the West at the time. Along with profits, the Comstock led to a series of innovations in mining technology that influenced mining across the length and breadth of the West.

The Comstock Lode had its origins in the enthusiasm for the CALIFORNIA GOLD RUSH, whose riches produced a widespread search for similar gold deposits across the

American West. In the summer of 1859, Peter O'Riley and Patrick McLaughlin found the site of what would become the Orphir mine. The rush to the new El Dorado began with the discovery that the "blasted blue stuff" that interfered with placer mining for gold turned out to be very rich silver ore. In the rush to the region that followed, prospectors and investors of varying degrees of skill would eventually register more than 17,000 claims, most of which were worthless. One-half of the Comstock's ore production and almost four-fifths of the mining dividends came from pairs of adjacent mines: the Belcher and Crown Point and the California and Consolidated Virginia. Such odds of success, however, were much like those of other mining districts in the West.

The Comstock Lode was to be the West's first great silver bonanza. Unlike the early CALIFORNIA experience, mining in the Comstock demanded large investments of capital, so the best claims soon passed into the hands of California entrepreneurs with capital to develop the sites. Because the ore lay deep underground in several major concentrations, experienced mining men and preparatory investment were required to bring it to the surface for processing. In this respect, the Comstock would become the first large mining enterprise in the West to resemble an industrial city. Furthermore, with investment demands that could be met only in San Francisco and other cities, the best mines in the Comstock were the property of absentee owners and developers almost from the beginning. The absentee nature of the exercise created all the benefits and disadvantages of such enterprise, and professionals on the site worked with shadowy and shady financial figures in San Francisco.

From the first ore discoveries in 1859, technology was crucial to opening the Comstock. The technical challenges silver mining posed were immense, simply because Americans had virtually no prior experience with the process. With huge stamp mills soon in operation, vast underground mining works, and complex operations to treat the crushed ore, the Comstock was a complex operation far removed from individual miners. The first major difficulty was how to prevent cave-ins in the deepening shaft. The solution was the "square-set" timbering process that permitted deep mining in unstable rock formations. The invention of Philip Deidesheimer, a German-born engineer, the technique quickly spread to underground mines everywhere in the West. Another technical problem desperate for resolution was physically hauling the extracted ore to the surface, a task made immeasurably more complicated by the great depths encountered. Traditional hemp ropes simply weighed too much, given the long length required, and they constituted a significant part of the breaking load. The solution came in 1864, when A. S. Hallide developed the first flat woven

wire rope. Both much stronger and lighter than hemp, it enabled heavier loads to be brought up to the surface from greater depths. This device proved so handy that it subsequently powered San Francisco's noted cable car system.

Very early in mining operations in the Comstock, large quantities of water had to be pumped out of the works by the Cornish pump. Pumping became a dire necessity at deeper intervals, where the water was scalding hot and deadly to any miner unfortunate enough to fall in the sumps. This required the development and installment of new and more efficient fans, blowers, and ventilation devices to keep workers constantly supplied with fresh, cool air. Otherwise, miners were reduced to work shifts of only one-half hour, the limit of human endurance at such temperatures. Prior to the addition of direct ventilation shafts, miners also received a daily allotment of 95 pounds of ice per man, which they would chew on to cool themselves between shifts.

Once the ore had been removed, it had to be separated and refined to extract the silver. The Mexican patio system of adobe smelting furnaces was employed initially for want of a better system, but at length the process proved too time-consuming. The system of crushing the ores with stamping mills was then employed in concert with steam-heated iron pans to hasten the process of amalgamation. Soon the pan-amalgamation process evolved to allow the separation of gold and silver ores quickly and cheaply.

Functional, efficient transportation to and from the mines was yet another technological obstacle that had to be addressed. At first, teams of horse- or mule-drawn wagons were employed to haul ore out to processing centers and then return with requisite supplies, but this system grew increasingly impractical as the rates of production increased. Improvement came in 1859, when the Central Pacific Railroad was completed. It ran through Reno, where the teams could drop off their cargoes for shipment to the East or West. This route was refined in 1869, when the new Virginia and Truckee Railroad ran a direct line from Virginia City to Reno and a direct connection to the Central Pacific. This modern transportation network facilitated the rapid shipment of tons of ore and completely eliminated the need for animal-powered hauling.

With the large capital investments and the rumors of the great profits to be made, the mines of the Comstock Lode soon made their appearance on the San Francisco Stock Exchange. Stocks in Comstock mines fluctuated wildly, producing some fortunes for the favored insiders, but whatever the results, the dramatic rises in the value of a few stocks kept the market in a state of continuous turmoil. The experience of the Comstock Lode first demonstrated that more money might be made in buying and selling shares of mining stocks than in actual mining operations. In this respect, the Comstock style of stock and stock

manipulation would become a model for railroads and speculation in railroad stocks in the next generation.

Technical innovations contributed to the first boom period from 1860 to 1863, but then Comstock profits languished. However rich the silver ores—and they were very rich indeed—mining for them posed continuing difficulties: deep shafts, rising water, impossible heat, and poor ventilation. With the decline in production and the falling stock prices, officers in the Bank of California bought up large numbers of shares at low prices. With new discoveries in the early 1870s, the bankers were in a position to reap great profits, and they did.

Other mining entrepreneurs soon took control of the Comstock. The so-called “Silver Kings” combined practical mining experience with stock manipulation to gain control of the “Big Bonanza” mines that produced the next generation of great profits. From 1873 to 1882, these mines produced \$105 million in silver bullion. The new discoveries were at astonishing depths, up to 3,000 feet underground. The technical difficulties of mining at such levels were notably eased by Adolph Sutro’s four-mile tunnel under Mt. Davidson. The tunnel offered ventilation, drainage, and easy access to ores. Various mine owners had opposed Sutro’s tunnel for a decade, fearful of the power that it would confer on him. Finally, with foreign capital, he completed the tunnel in 1878 and sold out the following year. Sutro’s exit with his fortune to San Francisco marked the beginning of the decline of the Comstock Lode. By 1880, the output and the profits were falling. Although exploration continued for years, the Comstock never recaptured its former leadership in silver mining.

The Comstock Lode had an impact on mining in the West that went beyond even its great profits. The technical knowledge acquired from mining at such deep levels and in processing the ores brought to the surface was transferred to mines all over the West. In this sense, the Comstock was a mining laboratory of exceptional significance, and the mining engineers who labored there would later open the great silver mines in Leadville and Aspen (Colorado), the next generation of silver bonanzas. Finally, the profits of the Comstock produced a group of mining entrepreneurs who would take their money and skills not only throughout the West but also around the world. The most important of these was George Hearst, who would go on to become the owner of the Homestake Mine in Lead, South Dakota, and an important figure in California politics.

The Comstock was also significant in the development of a mining city. Virginia City was the first great mining city: the political, financial, and social center of mining enterprise in Nevada. Indeed, it was Nevada’s most important site and mining its most important industry for a half century. Local editors and civic boosters declared that the population reached 30,000 in the bonanza years; the official

census number from 1870 was 10,917. Not until the rise of legal gambling in the 20th century and the emergence of Reno and Las Vegas has any city been as influential in Nevada as Virginia City. By 1880, as the mines shut down, Virginia City had also declined. But for as long as it was productive, the Comstock Lode transformed that settlement into one of the most influential technical, financial, and social centers of the West.

Paul, *Mining Frontiers of the Far West, 1848–1880* (Albuquerque: University of New Mexico Press, 1963).

### cotton culture

During the first half of the 19th century, cotton defined the South as no other crop did before or since. Its growing range and yield were enormous, encompassing at least a dozen states from North Carolina to TEXAS and producing at rates that doubled every decade between 1820 and 1860. Already by 1820, cotton accounted for nearly 50 percent of the value of U.S. exports. It also brought great growth to the region, as the population, despite the relocation of thousands of NATIVE AMERICANS, increased fivefold. During the 1840s and 1850s, the population grew from 7 million to 11 million. Among them were as many as 3.5 million slaves, whose labor was central to the success of medium-sized farmers and large planters alike. By mid-century cotton was indelibly associated with the southern economy, lifestyle, and political outlook, and for good reason: By 1860 the United States produced and exported 4.5 million bales of cotton (2 billion pounds), which constituted two-thirds of the world’s total cotton production and nearly 60 percent of the nation’s exports by value. And while 75 percent of all cotton was exported to England and the mid-Atlantic states, the remainder ended up in the textile mills of New England, where a cordial and profitable economic connection had evolved between factory and plantation owners.

Accounting for more than 65 percent of the world’s cotton by the 1850s, the south was a major contributor to the U.S. national ECONOMY. In 1855, David King published *Cotton Is King*, in which he noted that cotton was royalty, in constant international demand for textiles and other uses. The erosion of the practices that built an effective single-crop economy—on economic, political, and moral grounds—marked the later antebellum years and laid the foundation for the coming civil war. This dogged overreliance on a single crop, however, stagnated the southern economic infrastructure, especially compared with the rising

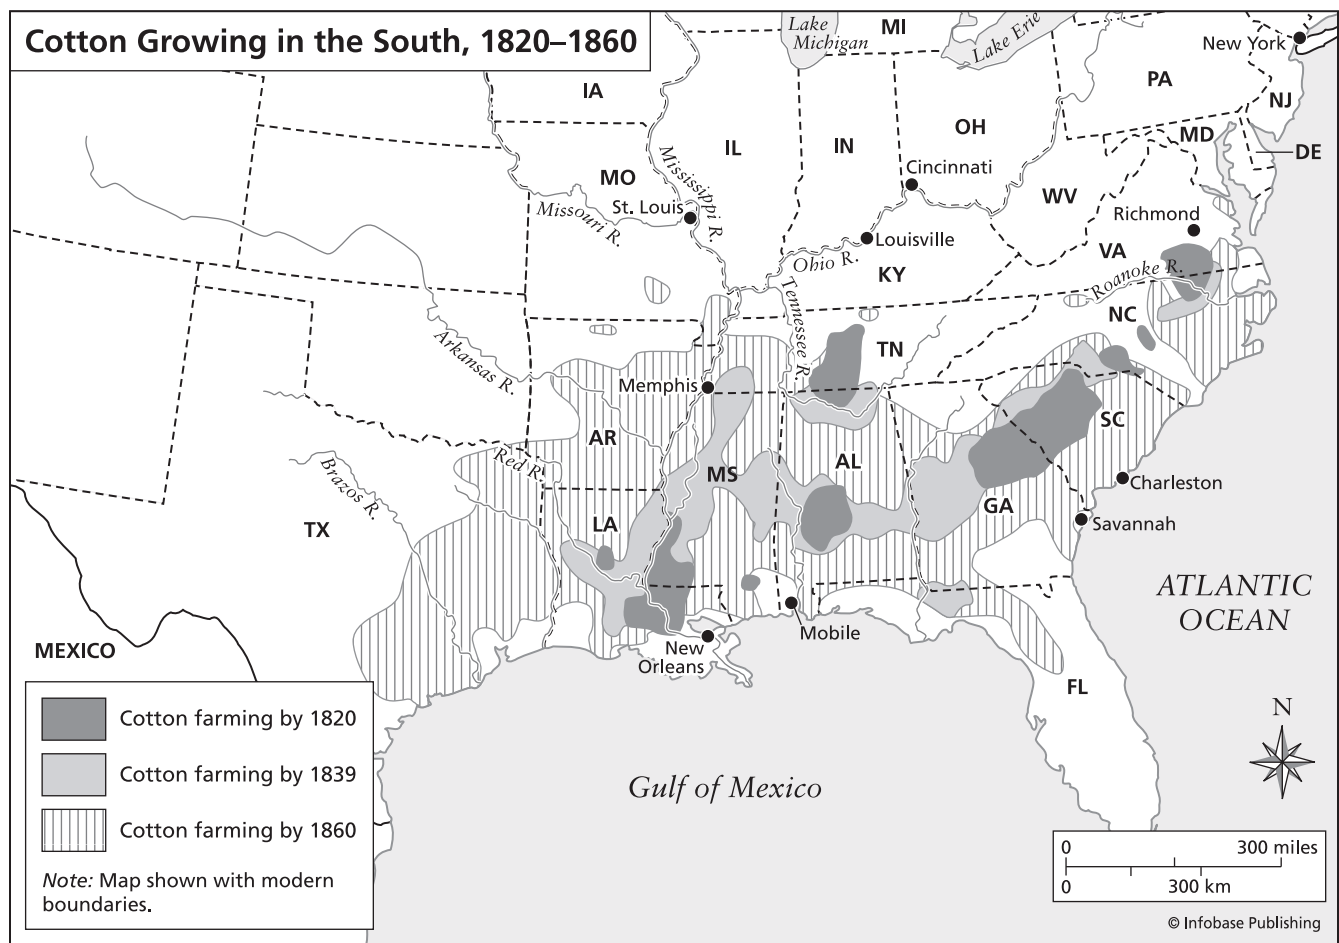

industrialization and central financing of the North. This ultimately laid the seeds for defeat in the Civil War. But the cotton culture ran deep throughout the fabric of southern life, and it was not until 1865—and then at the point of Union bayonets—that “King Cotton” and the SLAVERY sustaining it were effectively dethroned.

Before the early 18th century, tobacco and rice were the primary commercial crops in the South, and both depended on slave labor. Although the southern states of Virginia and Maryland had successfully raised tobacco in the late 18th and early 19th centuries, with production levels climbing to what they had been before the Revolutionary War, by the 1810s and 1820s they had become transformed by cotton. Tobacco, which had yielded 15 percent of the value of U.S. exports in 1820 brought only 6 percent of that amount in 1845. Rice had also been an important export crop, but beginning at the end of the 18th century, exports stagnated and remained low until the 1850s. In the early 19th century, sugar developed into an important commercial crop, first in the Upper South and later in the Gulf region, and would be another slave-based crop that provided no eco-

nomic reason for the South to free slaves, as would occur in the North during the late 18th and early 19th centuries.

At the same time, a new crop was being grown: cotton. It arose to serve an increasing export market for textile businesses in the newly industrialized Britain. But the type of cotton being grown, long-staple cotton, could be raised successfully only in the sea-island areas of Georgia and North and South Carolina. Another variety, short-staple cotton, was more geographically adaptable but had gummy seeds that were too labor-intensive to remove by hand and keep the crop profitable. The success in 1793 of Eli Whitney’s invention of the cotton gin, which removed seeds from cotton, transformed short-staple cotton harvesting and began its titanic expansion across the South and West. In 1815, southern cotton production stood at 150,000 bales (one bale equals 500 pounds); by 1826, it was 600,000 bales per year; by 1851, it had reached 2.4 million bales per year.

Since their initial migration south and west to Alabama and the western parts of the Carolinas, Florida, and Arkansas, white planters fought with several Native American nations including the Creek, Cherokee, and Choctaw for

control of the region. Agreements such as the 1814 Treaty of Fort Jackson ceded former Native American lands to the U.S. In the 1830s, nations in the Southeast including the Choctaw, Cherokee, and Chickasaw were relocated west of the Mississippi River, some traveling along the TRAIL OF TEARS to Oklahoma. Even nations that adopted settlers' ways, such as the Cherokee, were forced to remove themselves from the South during the 1830s. Ironically, many of the so-called Five Civilized Tribes adopted slavery and cotton growing in their new homeland, a circumstance that contributed to their siding with the Confederacy in 1861.

At the same time (and continuing through 1860), up to a million slaves were brought to the South, particularly to the millions of acres of the soil-rich Lower South. To farmers and planters, slaves provided a secure, self-perpetuating source of labor that increased at the rate of 30 percent each decade between 1820 and 1860. Slaves were considered even more valuable to agricultural success than they had been two or three decades earlier, before the rise of cotton. As a result, the South considered any move away from SLAVERY to be a threat to self-preservation. Accordingly, southern support for the emancipation of slaves nearly vanished. While in the 1820s southern antislavery societies outnumbered those in the North, they were virtually nonexistent in the South by the late 1830s. In addition, the number of slave states in the region more than doubled, from six to 15. Following the abolition of the African slave trade in 1808, there arose an equally insidious domestic SLAVE TRADE, whereby surplus chattels from the tidewater regions of Virginia and Maryland were sold to new masters in the cotton-producing regions of the Old Southwest. Not only were slaves transported there in chains and work gangs, but their sale frequently involved the breakup of established family units. It is estimated that by 1860 nearly 1 million blacks had been forcibly relocated to a harsh existence in the Deep South.

Yet only a minority of the population was slaveholders, a number that decreased due to increased slave costs over the course of the 19th century. In 1850, 347,825 of 6 million white residents of the South owned slaves. Further, as fewer planters owned slaves, cotton production, property, and wealth became concentrated in those families holding the largest number of slaves. Of the 10,000 families holding 50 or more slaves, the wealthiest among them were the 3,000 families owning more than 100 slaves each. About 90,000 farmers owned between 10 and 99 slaves; about 255,000 other farmers owned fewer than 10 slaves. Two percent of slaveowners owned half of all U.S. slaves.

There was great variety among slave-owning cotton farms in the South. While the 3,000–4,000 large slave-owning plantations had a greater role in cotton production by mid-century, much of 19th-century cotton was

grown on small to medium-sized farms with limited slave labor. For example, a middle-class planter might have 10–50 slaves on his farm, which, if managed correctly, could yield substantial profit; a workingman's farm would have less than 10 slaves. Generally, such small farms were characterized by their overall poverty, with owner and slave working side by side in the field on cotton that yielded only \$125 per year. As Mark Twain described it in *The Adventures of Huckleberry Finn*, this was "one of those little one-horse cotton plantations" with a "rail fence around a two-acre yard . . . [and] some sickly grass-patches in the big yard."

Life on large plantations was vastly different. The family home on the site would have been fashioned in what architect Frederick Law Olmstead called "a Grecian style," with wooden slave housing situated far from the house. Slave labor was monitored by the overseer, whom the plantation owner hired to discipline slaves and maintain profits. An intelligent and able slave was given the job of driver; he was the overseer's closest subordinate and was responsible for managing the slaves. One common factor for all slaves was the long workday, which ran for 12–15 hours per day, and longer if the moon allowed.

The demands and rewards of the "King Cotton" economy resulted in a fivefold population increase during the first six decades of the 19th century, but it kept the South an unsophisticated agricultural economy. Because it produced few other goods, it needed to import goods from northern manufacturing states; and because prices for cotton fluctuated greatly, the South had little capital to invest in manufacturing and therefore had to purchase goods and rent storage space for cotton from northern suppliers on credit. In the 19th century, such practices left the South in a chronic state of financial instability. The social implications of the cotton culture were equally stark; the rise of large plantation systems retarded the growth and maturation of urbanized areas and, with it, viable banking and transportation systems. An unsavory result of this state of affairs was that yeoman farmers were forced to turn to their richer neighbors for assistance in marketing their produce. Given the near-total absence of social services, virtually every aspect of social life was the de facto domain of the landed gentry, including community services, education, and government. Church life was the only facet of private life available to non-slaveholding whites. This overt dependency stimulated the rise of a dominant planter class wielding political influence far in excess of its actual numbers, and it is no exaggeration to say that the abiding interests of the planters came to represent or embody the basic interests of the South in general.

Some southern spokesmen attempted to counter encroaching northern dominance by rallying the next generation to embrace industrialism. In 1849, according

to an editorial in the *Sumpter Banner* of South Carolina, the current generation should feel compelled to cast aside the timeworn call to preserve gentility and prepare “the rising generation for mechanical business.” But it was too late to catch up to the urbanized, industrialized North. In the northeast, one-third of residents lived in cities and towns; less than 13 percent of residents of the Southeast were similarly urbanized. The distinction between industry and agriculture was similar: As late as 1860, 60 percent of northern workers were employed in nonagricultural jobs, while only 16 percent of southerners were employed in nonagricultural work. That meant there were 1.3 million industrialized workers in the North but only 110,000 in the South.

Meanwhile, the South encountered an immediate, chronic threat to cotton planting: overplanted, exhausted crop land. In 1826, the Upper, or old, South, accounted for more than half of cotton produced. But the cultivation of a single crop depleted the soil and reduced yields dramatically—in some areas, up to 50 percent. In response, planters entered what would become a common situation: being compelled to move westward for fresh soil. In the 1840s and 1850s, planters and slaves from the formerly fertile cotton states of Maryland, Virginia, and South Carolina moved to the rich Gulf and Mississippi River states of Louisiana, Alabama, Arkansas, Mississippi, and Texas. Over the next several decades, they moved even farther west, to Arizona and California.

While cotton production in the Lower South soon doubled or tripled the production of the old South, it resulted in wealth for only the few large plantations and farms, which were able to replenish their ranks of slaves from within. In response, smaller farms unable to find or afford slaves called for the resumption of African slave trade, which had been outlawed for several decades. This position, which stood in opposition to national law and Northern sensibilities, became one of the many factors that hastened the Civil War and brought an end to the “peculiar institution” of slavery and the cotton culture it supported.

## Creek

The Muskogean-speaking peoples known better and collectively as the Creek were one of the so-called Five Civilized Tribes occupying the southeastern United States. The Creek were a multilingual confederation for most of their history. They employed a relatively advanced political organization based upon individual towns (*talwa*), each ruled by its own chief, or *micco*. The Creek began coalescing in the wake of Spanish intrusions into the southeastern United States after 1540 and by the 18th century had developed into a formidable confederation of tribesmen actively trading and intermarrying with English settlers. Relations between the Creek and the United States were stormy until late 1790, when Chief Alexander McGillivray (1750–1793) signed the Treaty of New York to stop white encroachment upon traditional tribal grounds in Georgia and Alabama.

By the early 19th century, the U.S. government had begun a concerted effort to help “civilize” the tribes by encouraging them to adopt agriculture, Christianity, African slaves, and other trappings of modernity. The principal catalyst for change was the noted Creek agent Benjamin Hawkins (1754–1816), who consistently worked to protect his charges against illegal settlers. The ensuing friction between traditional ways and assimilation crested in August 1813. Inspired by the Shawnee leader Tecumseh, the Upper Creek of Alabama precipitated the Creek War by attacking Fort Mims, Alabama Territory, and slaughtering the inhabitants. This drew a sharp response from General ANDREW JACKSON and his Tennessee militia who, aided by the Lower Creek under WILLIAM MCINTOSH, crushed Indian resistance at Horseshoe Bend. Chief William Weatherford (1780–1824), leader of the “Red Stick” faction, then surrendered to Jackson, who imposed the Treaty of Fort Jackson. This stripped the Creek Indians, friendly and hostile alike, of 22 million acres of pristine land in Alabama.

In the 1820s the pace of Indian removal quickened as throngs of settlers moved into land previously populated by the Creek, while ambitious land speculators coveted the remainder. In 1825 Chief William McIntosh (1775–1825) was assassinated by discontented Creek for illegally selling more land to whites. The Creek also countered encroachment by adopting republican forms of governance to convince the whites of their ability to assimilate. Nonetheless, in 1830 President Andrew Jackson signed the INDIAN REMOVAL ACT into law. This mandated the forced relocation of all NATIVE AMERICANS in Georgia and Alabama to new homes across the Mississippi River in the designated Indian Territory (Oklahoma). The Creek pursued every legal avenue available to forestall this, but by 1836 they had exhausted their appeals. Forced out, an estimated 3,500 of the 15,000 Creek died en route from hunger, disease, or exposure. The ensuing period of transition to a new land

also proved costly and the population suffered further decline, but eventually an elaborate plantation system, manned by slaves, began to generate wealth for the owners. In 1839 a major gulf was crossed when representatives of the Upper Creek and Lower Creek merged into a single national body for the first time in their history. The Creek suffered further deprivation and population loss in the course of the U.S. Civil War (1861–65) after they, like most of the Five Civilized Tribes, sided with the Confederacy.

### **Crockett, Davy** (1786–1836) *frontiersman*

Politician, soldier, and Texas patriot, Davy Crockett became most famous for his frontier exploits. Born in Greene County, Tennessee, in 1786, the young David Crockett had minimal schooling. By the time he was 12, he was at work, first as a cattle drover, then as a freight hauler, and, in slack times, as a farm laborer. He married Polly Finley, and on a rented tract of land he built a cabin and began to farm. Crockett was an excellent hunter and adept in the woods, but he had little interest in the regular labor associated with farming. In 1811, with his wife and two children, he moved from what was then eastern Tennessee to middle Tennessee, settling in Lincoln County near the Alabama line. The countryside was then in turmoil over Indian raids and news of a battle at Fort Mims. ANDREW JACKSON had begun to recruit volunteers, and Crockett immediately joined the local militia. He participated in the campaigns that followed the outbreak of the WAR OF 1812, but he was not present in 1814 at Jackson's great victory over the Creek Confederation at the BATTLE OF HORSESHOE BEND. In another twist of fate, Crockett joined a mounted Tennessee battalion that went to confront Indians in southern Alabama and northern Florida, as a result of which he missed Jackson's even greater triumph at New Orleans.

With the war over, Crockett returned to middle Tennessee. In 1816, upon the death of his wife Polly, he married a widow, Elizabeth Patton. Sometime during these years, he contracted malaria and only gradually recovered his strength. Meanwhile he tried, seemingly without success, to find some way to profit from the great internal migrations that characterized the years immediately after the war. In 1817, he moved to west Tennessee, and when Giles County was established, Crockett became a justice of

David "Davy" Crockett (Library of Congress)

the peace and was also elected a colonel in the militia. In 1821, he was elected to the Tennessee Legislature, where he supported the claims of squatters and small landholders. Reelected after a spirited campaign, he now represented a larger constituency, as west Tennessee had begun to grow. During this term, Crockett incurred the wrath of Jackson and his party by failing to support their candidate for the U.S. Senate.

Over the next decade, Crockett shifted his attention to the national political scene. In 1825, he was defeated in an election for the U.S. House of Representatives. He was subsequently elected in 1827, reelected in 1829, defeated in 1831, reelected in 1833, and finally defeated again in 1835. His mixed political success in contests for the House of Representatives reflected the close balance between the DEMOCRATIC PARTY and the WHIG PARTY. It also reflected a political fact of life about this 10-year period—namely, that Andrew Jackson (elected president in 1828) and his party were the dominant political force in Crockett's native Tennessee. Crockett was a Whig in a Democratic world.

Jackson was the state's favored son, the first western president, and the pride of the state. Throughout his terms in Congress, Crockett generally voted against Jackson's measures. That he was elected to the House three times in this 10 years reflected his great personal popularity, an appeal that in the final analysis could not counter the power of the Democratic Party and the leadership of "Old Hickory."

With the end of his political career in the 1835 election, Crockett left his family and went to TEXAS in search of new opportunities. In February 1836, he and his companions arrived in San Antonio, where they joined the Texan force that was holding THE ALAMO. On March 6, the army of General ANTONIO LÓPEZ DE SANTA ANNA launched a frontal assault, and all the defenders of the Alamo mission died, including Crockett.

Crockett was one of the first politicians on the national scene to make a virtue of rural origins with minimal education. Throughout his career—whether as justice of the peace, colonel in the militia, or representative in Congress—he prided himself on his wide experience in the world and his good common sense. He delighted in debunking proper spelling and grammar. His autobiography, *A Narrative of the Life of David Crockett . . . Written by Himself* (1834) confirmed these eccentricities of style. Even in life, Crockett had been the subject of much legend and myth. His death at the Alamo further enhanced his qualities as the natural frontier figure, representing freedom of movement and action, good judgment, and common sense. His death also confirmed him as a man of principle, willing to die for the cause in which he believed.

**Further reading:** Davy Crockett, *Davy Crockett, His Own Story: A Narrative of the Life of David Crockett . . . Written by Himself* (1834; reprint, Bedford, Mass.: Applewood Books, 1993).

## Cuba

The island nation of Cuba found itself the object of American advocates of MANIFEST DESTINY and proslavery expansionists in the antebellum period, as the United States sought to extend its influence and continue to wrestle with the issue of SLAVERY.

The sugar industry exploded after 1791, when French planters fled a slave revolt in Haiti and settled in Cuba. Sugarcane rapidly blanketed the island, and as a result 700,000 Africans were imported to work the plantations over the next 40 years; they eventually outnumbered whites on the island. Cuba was the world's largest sugar producer, and the newly independent United States was its biggest market. Meanwhile, the criollo bourgeoisie (born in Cuba of Spanish descent) was becoming wealthier and impatient with Spanish rule. By 1825, there were only two Spanish

colonies left in the Americas: Cuba and Puerto Rico. The United States twice attempted to buy Cuba from Spain, in 1848 and 1854, but the colonial power refused to sell. In the 1850s, nationalist pressure for self-rule began to build and soon became unstoppable.

Having acquired EAST AND WEST FLORIDA from Spain in 1819, the United States had expanded to within 90 miles of Cuba. In a letter to Minister to Spain Hugh Nelson, Secretary of State JOHN QUINCY ADAMS described the likelihood of U.S. "annexation of Cuba" within half a century despite obstacles: "But there are laws of political as well as of physical gravitation; and if an apple severed by the tempest from its native tree cannot choose but fall to the ground, Cuba, forcibly disjoined from its own unnatural connection with Spain, and incapable of self support, can gravitate only towards the North American Union, which by the same law of nature cannot cast her off from its bosom." Cubans called this policy *la fruta madura* (ripe fruit); Washington would wait until the fruit was considered ripe for the picking.

By the end of the 18th century the United States had begun to play an increasingly prominent role in Cuba. With Spain involved in the European wars of the late 18th and early 19th centuries, the U.S. government was in a good position to take advantage of the situation. It was geographically well-positioned, since Cuba was only 90 miles away; the United States was growing in population; and the U.S. economy was expanding.

By 1850 the United States, Great Britain, and Spain accounted for 80 percent of Cuba's total foreign trade, with the Americans capturing 39 percent of the market, the British 34 percent, and the Spanish 7 percent. Spain's importance to Cuba had diminished relative to that of the United States, and Spain could guarantee neither adequate markets for Cuban goods nor sufficient supplies. Yet while Spain's importance was declining, the government refused to relinquish its hands-on approach to Cuban affairs and continued to regulate Cuban trade by levying customs duties on imports and taxes on exports, thereby lowering profits for Cuban producers and increasing prices for the island's consumers.

In 1825 Mexico and Venezuela planned an expedition to Cuba in order to help the struggle for independence. But the United States, fearing an independent Cuba would lead to the end of slavery with repercussions in the southern states, let it be known that it would block any move to liberate Cuba from Spain.

Throughout the 1840s there had been several invasion attempts by southern expansionists, in the hopes that the slave-owning elite would declare independence from Spain. Once Cuba was independent, it would be invited to join the Union as a slave state. In October 1849, the first filibustering expedition by Narciso López, with the intention

of invading Cuba, ended in abject failure. López led a second expedition in May 1850 and, after that failed, another expedition in August 1851. On this third attempt, López was captured by the Spanish army and publicly executed in Havana.

In 1853 President Franklin Pierce covertly supported a new Cuban expedition led by John A. Quitman, an associate of Narciso López and former governor of Missouri. While Quitman was building his forces, Pierce offered Spain \$130 million for Cuba, which was refused. In Havana, Spanish police boarded an American merchant ship, the *Black Warrior*, and imprisoned her crew under the charge of “violating customs regulations.” The Pierce administration tried to take advantage of the situation by threatening to declare war on Spain, but northern Democrats would not support Pierce’s attempt to take Cuba by force, so the ploy failed.

Under instructions from Secretary of State William Marcy to put pressure on Pierce to seize the island, the American minister to Spain, as well as the ambassadors to France and Great Britain, sent an inflammatory message to Pierce that became known as the Ostend Manifesto. Invoking the rhetoric of Manifest Destiny, the three American diplomats declared that the United States was justified in seizing Cuba. Quickly leaked to the press by antiexpansionists, the Ostend Manifesto triggered a new wave of northern resentment against the South and forced Pierce to halt his efforts to acquire Cuba.

## **Dana, Richard Henry** (1815–1882) *lawyer, writer*

Author and lawyer Richard Henry Dana was among a small group of Eastern literary figures (including Francis Parkman) who wrote about the West. Born in Massachusetts in 1815, Dana entered Harvard College in 1831 at the age of 16. Dogged by health problems, especially failing eyesight as a result of an earlier bout with measles, he withdrew from college. His family then sent him on a long sea voyage to recover his health. In 1834, he sailed as a common seaman on the brig *Pilgrim*, bound from Boston to CALIFORNIA by way of Cape Horn. Arriving in California in 1835, Dana witnessed the trade in hides and tallow characteristic of the California economy at the time. He returned to Boston in excellent health in 1836, reenrolled in Harvard College, graduated in 1837, and then read law and was admitted to the bar in 1840. That same year, he published *Two Years Before the Mast*, an account of his two-year voyage and sojourn in California.

Dana's book gave him something of a national literary reputation and became known for its descriptions of the brutal treatment of common sailors on ship. In addition to the physical hardships of poor food, little sanitation, and crowded living conditions, sailors were subjected to arbitrary and brutal punishment by officers, especially flogging, for a variety of transgressions. The book was also an invaluable account of life in Mexican California, if not the most important detailed description of the Californios's existence before their lands and culture were submerged by the great influx of Americans after the CALIFORNIA GOLD RUSH of 1849. Dana's depictions of the California ranchos and the elaborate pastoral economic and social life built on trade in hides and tallow have become a necessary historical document for understanding life in California before 1848. The book was later reprinted in English and French editions.

Dana practiced law with great success, specializing in admiralty cases. He also pursued an interest in politics, becoming an important figure in the FREE-SOIL PARTY. In 1851 he acted as attorney for the defense for Shadrach

Minkins, who was rescued by abolitionists, in Boston and also defended fugitive slave ANTHONY BURNS in 1854. Dana's interest in politics had a patrician slant to it. He believed strongly in the principles associated with political parties and their platforms (hence his support of the antislavery doctrines of the Free-Soil Party), but he had no taste for campaigning, and he intensely disliked the corruption and favoritism popularly associated with successful political campaigns.

Dana continued his successful law practice for the next 30 years. In 1866 he lost a contest for a seat in the U.S. Senate to Benjamin Butler. A decade later, President Ulysses S. Grant nominated Dana as ambassador to England, but the Senate refused to confirm him because Grant had acted without consulting party leaders. In 1882 Dana died in Rome, Italy, while on a tour of the continent.

## **Dartmoor Prison**

Located in southwest England near Plymouth, Dartmoor Prison was the compound used by the British in the WAR OF 1812 (1812–15) to hold as many as 6,000 captured American sailors and privateersmen. American prisoners of war hated its desolate location on a barren moor. While many suffered illness and malnourishment, others set up trades and stores within its walls to service their fellow prisoners. In a world unto itself, the prisoners even established schools to teach navigation, dancing, and boxing.

The most famous section of the compound was Prison Number 4. In 1814 the British placed all of the African-American prisoners in this prison, along with whites who were considered undesirable by other prisoners. The black prisoners were led by Richard Craftus, a huge African American also called King Dick, and they were known for holding religious services and theatrical performances

in their prison house. The American prisoners were often unruly and challenged the authority of the British guards. Conditions became even more explosive after the peace agreement of the TREATY OF GHENT (December 24, 1814). Without an easy means of accommodating the prisoners and returning them to the United States, and preoccupied by the return of Napoleon to France in the spring of 1815, the British did not release their prisoners of war. The Americans rioted on April 4, 1815, when the British commissary attempted to serve them hard biscuits instead of the usual soft bread. The Americans won that confrontation, and the British found the appropriate bread for them.

On April 6, 1815, an incident along the wall of the prison, where some prisoners were thought to be trying to escape, led to a general alarm. Amid the confusion, and as the prisoners began to rush the gate, the British guards opened fire on the Americans, killing six and wounding many more. This event was called the Dartmoor Massacre and remained a searing testimony of British perfidy for the American maritime community. A joint American and British diplomatic commission, however, determined that no one was at fault, thus defusing a potentially divisive diplomatic incident immediately after the War of 1812.

### **Dartmouth College case (*Trustees of Dartmouth College v. Woodward*, 1819)**

In 1816 the New Hampshire state legislature altered the charter of Dartmouth College (granted by the colonial New Hampshire legislature in 1769) to assert state control over the institution. The private board of trustees of the college opposed this action, but the New Hampshire supreme court decided in favor of the state. In 1819, the case was brought before the U.S. Supreme Court, with Chief Justice John Marshall presiding. DANIEL WEBSTER, a Dartmouth graduate, represented the college. He argued that the New Hampshire legislature's action was an abrogation of contract, since it altered the act of incorporation that created Dartmouth College. As such, the change was a violation of the contract clause of the U.S. Constitution and was therefore unconstitutional. In a 3–1 vote, Marshall and the Supreme Court were convinced by Webster.

Although the decision was rendered in a case involving the incorporation of a private institution of higher learning, it had a larger application to the world of business in that it helped to secure the sanctity of the corporation, a legal entity that was in this period just taking on much of its modern form. Because of the Dartmouth decision, private companies with acts of incorporation believed they were protected from state legislative interference. To get around this problem, many state legislatures started inserting a reserve clause into acts of incorporation creating private companies. The sanctity of the corporation was also

subsequently weakened by the Charles River Bridge Case of 1837.

### **Decatur, Stephen (1779–1820) naval officer**

Stephen Decatur was a swashbuckling officer of the American navy in the early 19th century. Born in Maryland on January 5, 1779, Decatur grew up in Philadelphia in a seafaring family. He became a midshipman in the U.S. Navy in 1798 and fought in the Quasi War (1798–1800) with France. But he first gained fame in action off the coast of Tripoli in the war against the Barbary pirates, by which time he had been promoted to lieutenant. In 1804, the American frigate *Philadelphia* had run aground off Tripoli harbor and been captured. On the night of February 16, 1804, Decatur led a raid into the harbor to deny the vessel to the Tripolitans. He and his men entered the harbor on a captured schooner named the *Intrepid*, seized and burned the *Philadelphia*, and made a safe getaway. Decatur was

Stephen Decatur (Library of Congress)

promoted to captain on the basis of this expedition. He also was involved in several other engagements at Tripoli, including hand-to-hand combat, that captured the imagination of the American public.

At the beginning of the WAR OF 1812 (1812–15), Decatur was captain of the frigate *United States*. On October 15, 1812, he outmaneuvered a slightly less powerful foe, the *HMS Macedonian*, pummeling her with over 70 broadsides, killing or wounding a third of her crew, and forcing the British captain to strike her colors. This action was one of a series of spectacular single-ship victories at the beginning of the war, but the British blockade kept Decatur trapped in American harbors for over two years. On January 15, 1815, unaware of the TREATY OF GHENT of December 24, 1814, Decatur took advantage of weather conditions to slip out of New York harbor in the frigate *President*, but he struck a sandbar off Sandy Hook, damaging the ship. Winds prevented his reentry to New York harbor, so he continued his efforts to run the blockade. Several British frigates pursued him. He was able to defeat the fastest of these, but, almost crippled from the battle and running aground while dealing with a storm at sea, he was compelled to surrender to the other two.

Later that year, Decatur took command of the American squadron sent to destroy the Algerian ships that had attacked and exacted tribute from American vessels. In a short and brilliant campaign, he defeated the naval forces of Algiers, forced Tunis and Tripoli officials to sign peace treaties and pay indemnities, and helped bring to an end the power of the Barbary Coast pirates who had been the scourge of the western Mediterranean.

When James Barron, who had been court-martialed after the *Chesapeake-Leopard Affair* in 1807, issued a challenge because of statements Decatur made concerning Barron's reinstatement in the navy the two agreed to meet in a duel. Decatur wounded Barron, but the shot he received was fatal. Decatur died on March 20, 1820. He is best remembered today for the toast he gave at a dinner: "Our country . . . may she always be in the right; but our country, right or wrong."

De Kay, *A Rage for Glory: The Life of Commodore Stephen Decatur, USN* (New York: Free Press, 2004); William M. Fowler, Jr., *Jack Tars and Commodores: The American Navy, 1783–1815* (Boston: Houghton Mifflin, 1984).

**Deere, John** (1804–1886) *inventor of the steel plow*  
John Deere was an innovative inventor and manufacturer of the plows and farming equipment that helped make Amer-

ican AGRICULTURE more productive. Deere was born in Rutland, Vermont, on February 7, 1804, the son of a tailor. His parents were both formerly British subjects who had sided with Great Britain during the American Revolution and later settled in New England. Deere received scant formal education and was apprenticed to a blacksmith at 17. He proved himself an excellent worker and established a reputation for high-quality metalwork. For 12 years he worked at or owned several blacksmith shops around Vermont with considerable success, until fires and the depression of 1837 forced him into bankruptcy. To escape his debts, Deere relocated to Grand Detour, Illinois, at the behest of a friend, Leonard Andrus, through whom he established another shop. As before, Deere cemented his reputation for high-quality smithing. He also encountered farming conditions radically different from those of New England, especially difficulties associated with plowing on the prairie. He set about resolving them between bouts of the usual blacksmith work.

The soil of the Midwest was rich and fertile, but particularly heavy and sticky. Under these conditions, a farmer tilling land with a conventional iron plow was forced to stop and periodically clean the moldboards (which did the actual plowing), as sod accumulated in clumps. Deere immediately saw the need for a better-designed device that would clean itself while in operation. His first efforts were unsuccessful but displayed an innovative streak that characterized his later life. Deere's first plow was actually a broken blade saw made of steel, which he bent over a log, hammered into place, and fashioned into a curved plow blade. During trials it cut through the prairie clay better than any iron device extant. Thereafter, using only polished steel in place of iron, he perfected a series of new, wedge-shaped plows capable of tilling through heavy prairie soil without the necessity of constant cleaning. The result was greater acreage covered and far less effort expended. However, sales were slow. In 1837 Deere sold only three plows. Two years later, he sold 10 and in 1840 a mere 40, forcing him to concentrate upon his routine blacksmith activities for income. But by 1848 Deere had relocated to Moline, Illinois, by the Mississippi River; acquired a business partner; and expanded his sideline into a full-fledged business. This move afforded the company closer proximity to water power and river-borne transport, and hence easier access to raw materials and new markets.

Intent on producing the finest plows available, Deere had to import steel from Sheffield, England, and also took on several business associates. After the introduction of harder steel from the Bessemer-Kelly process, he was able to acquire high-quality steel from Pittsburgh. Significantly, the nation's first supply of agricultural steel was made at the behest of the John Deere Company in 1846.

Deere spent considerable effort perfecting his plows, especially developing the optimum curvature for steel moldboards. By 1857 the John Deere Company was firmly established and selling 13,000 plows a year, making him the largest farm-tool manufacturer in the Midwest. Moreover, his constant flow of inventions greatly enhanced the agricultural resources of his region, with tremendous profits to farmers and their attendant markets.

Outside the realm of improved farm technology, Deere was a pioneer in aggressive marketing techniques. Rather than wait for orders, he continually built up a backlog of inventory while dispatching company agents throughout the countryside and Canada to demonstrate his wares. Deere products were a common sight at state fairs nationwide, and he was among the earliest manufacturers to take out regular advertisements in publications such as the *Prairie Farmer*. He also established one of the earliest national networks of wholesalers and retailers. The result was a constant influx of capital, which Deere inevitably reinvested in upgrading and improving his line of products. At one point he was able to offer prospective customers five sizes of walking plows and three sizes of breaking plows. During the 1850s his company pioneered work in developing seed-drills and plows for large, steam-propelled tractors. By the mid-1860s he was making metal plows with interchangeable parts.

After weathering several national depressions, Deere became an important supplier of wagons, carriages, harnesses, and other useful articles for the Union army during the Civil War. His steady stream of effective plows also insured that the North enjoyed great abundance of food throughout this conflict. By 1868 the business was incorporated as Deere & Company, and actual leadership was passed on to his son Charles. Freed from administrative demands, Deere focused his energy and talents on continued development of agricultural equipment. His company also continued to be a leader with respect to sales, distribution, and service organizations nationwide.

Deere died in Moline on April 16, 1886, having significantly contributed to the expansion and profitability of American agriculture, along with modern promotional and servicing strategies. As such he was directly responsible for helping the first wave of farmers to populate the Midwest. Deere was not the first designer to use steel in designing a plow but, rather, the first to successfully market one. His was the plow, literally, that broke the plains.

### Democratic Party

The Democratic Party of the 19th century traced its roots to the Democratic-Republicans in the early republic. This party emerged in the 1790s out of a dispute over the proper role of the federal government within the framework of the new Constitution. A group in Congress coalesced around the leadership of Representative James Madison of Virginia. In the first administration, the spokesman for the opposition was Secretary of State Thomas Jefferson, also of Virginia. This Democratic-Republican "interest" believed that the administration of President George Washington and Secretary of the Treasury Alexander Hamilton (the latter of whom was a Federalist) assumed powers for the national government that were not explicitly delegated to it in the Constitution. The Republicans, as they called themselves (the longer name Democratic-Republicans was sometimes used in the early 19th century), charged that Federalists also secretly desired to impose a monarchy on the young republic and harbored far too much sympathy for the English model of government and economy. They pointed to the Jay Treaty of 1794, negotiated by the Washington administration with Great Britain to resolve outstanding issues from the American Revolution, as further proof of this tendency on the part of the Federalists.

The party of Jefferson and Madison saw itself as representing ordinary people, including farmers and urban laborers in the North and plantation and slave owners in the South against the pretensions of would-be aristocrats in the Federalist ranks. In turn, Federalists derided Republicans as too enthusiastic for the excesses of the French Revolution and for being irreligious. The Republicans did attract the support of deists and free thinkers, as well as Catholics and others drawn to Jefferson's advocacy of religious tolerance and Republican championing of political equality for white men.

Republicans and Federalists both believed that the other posed a genuine threat to liberty and to the republic that must be resisted whenever possible. In one of the most important elections in the political history of the United States, Thomas Jefferson of Virginia and Aaron Burr of New York defeated Federalist incumbent John Adams in

1800. Although Jefferson was generally acknowledged to be the leader of the party, neither he nor Burr received a majority of the votes in the electoral college, thus leaving the election to be decided by the House of Representatives. Jefferson was finally elected president, and he and his party assumed power. Although outgoing Federalist president John Adams did not remain in Washington to see his successor inaugurated, the ascendancy of Jefferson to the presidency by a peaceful transition of power was the first in the history of the young nation, thus setting a precedent.

Once in office, the Republicans pursued policies of reduced government spending, an enhanced respect for states' rights, minimal federal authority, and a belief that the federal government should not serve the interests of economic elites. Under Jefferson's leadership, taxes were cut, the national debt was paid off, and the Alien and Sedition Acts—laws passed by the Federalists to squelch political dissent—were revoked or allowed to lapse. Republicans, especially those from the slaveholding states of the South, did not want the federal government strong enough to threaten the institution of SLAVERY. They also generally supported the aspirations of poorer white men to gain

access to the ballot between 1800 and 1830, and most of these new voters supported Republican candidates when they gained the right of suffrage. Many workers in the cities and towns supported Republicans as well.

The Democratic-Republicans won every presidential election from 1800 through 1820 and took the country through the trauma of the WAR OF 1812, which the nation barely survived. After the war, the Federalists, due in part to their opposition to it, began a rapid decline into their final oblivion. During the 1820s—the so-called ERA OF GOOD FEELINGS—it seemed for a while that parties might fade from the American scene. When, for example, JAMES MONROE was reelected in 1820, he won every electoral vote but one. But in 1824, in a controversial election, JOHN QUINCY ADAMS was elected as a National Republican over ANDREW JACKSON, most famously known for defeating the British in the BATTLE OF NEW ORLEANS at the end of the War of 1812.

MARTIN VAN BUREN of New York played a crucial role in revitalizing the old Jeffersonian party in the 1820s. Forging alliances with southerners such as Richmond, Virginia, newspaper editor Thomas Ritchie, Van Buren thought that

This cartoon depicts Martin Van Buren, the presidential candidate for the Free-Soil Party, stretching over the Salt River (the slang term for political defeat) in his attempts to unite his party's Democratic and Whig factions against slavery. (Hulton/Archive)

political parties were crucial to the health of the nation in that they blunted sectional tensions and resulted in honest and healthy political competition. He saw the Democratic Party, as it was becoming known, as an alliance between “plain republicans of the North and planters of the South.” Meanwhile, Jackson and his devoted supporters continued to campaign over the ensuing four years of John Quincy Adams’s presidency, winning a convincing victory in the campaign of 1828.

The Democratic Party under the leadership of Jackson and Van Buren in the 1830s was committed to a strict interpretation of the Constitution and a limited role for the federal government in the life of the nation. Supporters of the party included farmers in the North and slave owners in the South, as well as mechanics and immigrants in the cities of the North. Jackson vetoed bills to promote internal improvements and the bill to recharter the SECOND BANK OF THE UNITED STATES, as the Democrats decried privilege and economic monopolies and saw itself as the party of the small producers, i.e., farmers and working men.

The “Bank War” of 1832 was crucial in shaping the second party system. In vetoing the rechartering of the Second Bank of the United States, Jackson saw himself as acting on behalf of the common people by striking at an economic power that had grown so powerful it threatened the integrity of the republic. Supporters of the bank saw Jackson as a demagogue playing on popular fears and overstepping his authority under the Constitution in issuing the veto. Opponents of the president, who was reelected in 1832 following the bank veto, began to call him “King Andrew.”

The Democrats also defended the rights of slaveholders and supported the removal of American Indians to lands west of the Mississippi. The party systematically rewarded its supporters with jobs and offices, as part of the so-called spoils system. Democrats also favored low tariffs, as they believed that a high tariff (or tax) on imported goods would enrich manufacturers and merchants at the expense of ordinary workers and farmers. Their support of such political rights did not, however, extend to women.

The Democrats between 1830 and 1860 opposed moral reforms such as the TEMPERANCE MOVEMENT, Sabbatarianism, and most important, abolitionism. They became the defenders of the desire of their constituents, including immigrants, to resist the reforming crusades that swept through the United States in the antebellum era. Democrats believed that the federal government should not coerce people on moral issues, just as it should not grant special privileges to economic elites. In this sense, the party’s program was essentially negative.

Andrew Jackson’s use of the presidential veto power encouraged the formation of an opposition party that called themselves Whigs. Using popular political techniques bor-

rowed in part from the Democrats, the WHIG PARTY nominated the aging general WILLIAM HENRY HARRISON, who subsequently denied Van Buren, Jackson’s successor, a second term in 1840.

Democrats in the antebellum period were not of one mind, however, especially on issues of the ECONOMY. In many states, especially in the North, Democrats were divided between those who favored extensive banking, paper money, and economic expansion and those who feared that changes in the economy, such as the growth of wage labor, were potentially harmful to ordinary people. In New York, the latter group were known as Locofocos, a name that to Whigs and probusiness Democrats became synonymous with economic radicalism.

Where Democrats were more united was on the question of political democracy. This included defending the rights of immigrants in the face of nativism and the KNOW-NOTHING PARTY. Although the Democrats had support from native-born Protestants in all regions, they came to rely on the votes of immigrants in the larger cities of the Northeast. It was these voters who helped to elect Democrat JAMES K. POLK of Tennessee over HENRY CLAY in 1844.

In the 1840s the Democratic Party was the party of expansion, encouraging the annexation of TEXAS and settlement of the Pacific Northwest. They also supported the rights of white planters to take their slaves with them into new territories. This expansionist impulse led to the MEXICAN-AMERICAN WAR (1846–48), a conflict begun and prosecuted by President Polk.

In the war’s aftermath, growing sectional tensions over slavery caused severe conflicts within the Democratic Party. Northern Democrats were increasingly troubled by the expansion of SLAVERY, and one of them, Congressman David Wilmot of Pennsylvania, introduced a measure to ban slavery from all territory gained in the Mexican-American War. Martin Van Buren himself left the Democratic Party in 1848 to run as the nominee of the FREE-SOIL PARTY, which proposed that slavery be confined to those states where it already existed.

Despite the COMPROMISE OF 1850, the controversy over slavery continued to threaten the unity and stability of the nation and its political system. Although two northern Democrats were elected president in the 1850s—Franklin Pierce of New Hampshire and James Buchanan of Pennsylvania—neither was able to defuse the growing crisis. Tensions over slavery led to the collapse of the Whig Party in the 1850s. The Democrats desperately wanted to keep the entire question of slavery out of politics in order to keep the Union intact and to perpetuate their political alliances. But events overtook that strategy. The ill-advised Kansas-Nebraska Act, shepherded through Congress by Senator Stephen Douglas of Illinois, revoked the ban on slavery north of a line established by the MISSOURI COMPROMISE

of 1820. Under the act's provisions, slavery was permitted north of this line if the settlers of a territory voted to accept it. Northern Democrats who found themselves in profound disagreement with Douglas's doctrine of POPULAR SOVEREIGNTY began to desert the party. Some of them joined the new REPUBLICAN PARTY that was emerging in the northern section of the country. President James Buchanan, acting in what he believed was the spirit of the decision handed down by the U.S. Supreme Court that forbade territories from outlawing slavery, supported the admission of Kansas to the Union as a slave state. This series of events outraged many Democrats in the North, who now saw the slaveholding power expanding its influence over the nation's political institutions and soon, they feared, over the land of the United States itself.

Meeting in convention at Charleston, South Carolina, in 1860, the Democrats could not agree on a candidate for president. Reconvening a few weeks later in Baltimore, they selected Stephen Douglas. Several southern delegations walked out, fearing that the national Democratic Party was no longer fully committed to protecting slavery and states' rights. Southern Democrats nominated John Breckinridge of Kentucky. Douglas lost every northern state except New Jersey to Republican nominee Abraham Lincoln and the South to Breckinridge. Seeing Lincoln's victory as tantamount to the abolition of slavery, 11 southern states seceded from the United States, thus triggering the Civil War (1861–65). The Democratic Party, which traced its roots to Thomas Jefferson and which had held national power almost continuously from 1800 to 1860, lay in shambles, discredited and seen by most northerners as the party of slavery and, after 1861, of treason. The party ultimately survived these calamities, but only in the defeated South of the old Confederacy would it regularly hold power in the decades following the Civil War.

## Deseret, State of

The State of Deseret was a Mormon political community in what is now Utah. Though its period of official existence was short, from 1849 to 1850, "Deseret" more broadly refers to the Mormon community in Utah in its early decades, after its migration there in 1847 and before the admission of Utah into the Union as a state in 1896.

Officially known as the CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS, the Mormon Church was founded in 1830 in Fayette, New York, by JOSEPH SMITH, JR., who that year published the Book of Mormon, which he claimed to have translated from gold plates bestowed by an angel. (The name "Deseret" is said to mean "honey bee" in this book.) Based on the Book of Mormon and private revelations, Smith preached what he considered to be a restored version of Christianity, with a distinctive, highly centralized church structure and a strong emphasis on missionary activity and dedication to the community. The church grew rapidly, attracting converts from England as well as the United States. But the Mormons, or Saints as they called themselves, were repeatedly forced to move because of persecution from neighbors who objected to their unorthodox beliefs, communal economic practices, and bloc voting in public elections, among other sources of contention. The church's advocacy of POLYGAMY, by which men could have more than one wife, also attracted condemnation, although it did not become an official doctrine until 1852.

In the 1830s the church moved from New York to Ohio to Missouri to NAUVOO, Illinois. In 1844 Smith and his brother Hyrum were assassinated by a mob while being held in prison in Carthage, Illinois, on charges of treason. A schism developed over who should succeed Smith as leader of the church, but the largest group rallied behind BRIGHAM YOUNG, head of the policy-making body called the Quorum of the Twelve Apostles.

Young sought a safe haven for his church, a Mormon homeland far from "Gentiles" (as his people called non-Mormons). He identified it more than a thousand miles west in the Great Basin, an area of the Rocky Mountains then claimed by Mexico, though inhabited at the time only by Native Americans and a few American fur trappers and traders called MOUNTAIN MEN. Bordered by the Wasatch Range in the east and the Sierra Nevada and Cascade Range in the west, it was called the Great Basin because waterways drained into it as into an inland sink; it had no outlet to the sea. Full of strange and forbidding scenery, the region was protected from intruders by arid wastelands such as the Mojave Desert, and it contained several saline lakes, including the Great Salt Lake in what is now Utah. Young selected the Great Salt Lake Valley as the Mormons' destination. This would be the site of the "Gathering," the spiritually significant bringing together of all the Saints.

In 1846 Young led the first group of Mormon pioneers on the first leg of the journey, from Illinois to Winter Quarters (now Omaha, Nebraska). The following year, on July 24, 1847 (remembered in Utah as Pioneer Day), the epic migration, known as the Mormon trek, was completed when an advance party of about 150 Mormons arrived in Great Salt Lake Valley. Trees were scarce, but

the soil was fertile. William Clayton, one of the Mormon pioneers, called it “one of the most beautiful valleys and pleasant places for a home for the Saints which could be found.”

Wasting no time, the pioneers dammed a stream to provide water and planted corn, potatoes, winter wheat, and other crops. Land was parceled out to individual families. A city was planned in plots of 10 acres (four hectares) around Temple Square, a central plot of 40 acres (16 hectares) that would be reserved for a temple. That city received the name Great Salt Lake City, later (in 1868) abbreviated to Salt Lake City. In autumn 1847, Young was elected president and prophet of the Mormon church, officially becoming Smith’s successor.

While the Mormon trek was underway, the United States fought Mexico in the MEXICAN-AMERICAN WAR (1846–48). About 500 Saints, known as the Mormon Battalion, served on the U.S. side, affirming Mormon loyalty to the United States (often questioned by the church’s critics) and laying the ground for a claim to remain in the territory they had occupied. In the TREATY OF GUADALUPE HIDALGO, which ended the war in 1848, the Great Basin passed from Mexican to American sovereignty.

In 1849, expecting that the Mormon homeland would eventually become a state of the Union, Young called a convention to draft a constitution. The constitution that resulted that year formally created the State of Deseret, with Great Salt Lake City as its capital. The constitution provided for a bicameral legislature and supreme court, but in practice the state was a theocracy run by the church hierarchy headed by Young, who, running unopposed, was elected governor of Deseret on March 12, 1849. It was funded by tithing, the Saints’ contribution of 10 percent of their incomes to the church. Among the state’s official acts were the incorporation of the Church of Jesus Christ of Latter-day Saints, a charter for Great Salt Lake City, the establishment of what is now the University of Utah, and the founding of a Perpetual Emigrating Fund to lend money for migration expenses to poor Saints who wanted to come to Deseret.

As conceived by Young, Deseret included not only the Great Salt Lake Valley but almost a half-million square miles of territory, including an outlet to the Pacific Ocean in southern CALIFORNIA. It encompassed all of present-day Utah, nearly all of Nevada, most of Arizona, and parts of California, Oregon, New Mexico, Colorado, and Wyoming. To stake the Mormon claim, Young founded settlements at key points throughout this vast region, selecting by name the Saints who would colonize them. The chosen colonists usually complied willingly, though not always gladly. One Mormon girl cried when she learned that her father had been selected, but told a friend, “I should not own him as a father if he would not go when he is called.” In this

manner, about 350 settlements were established, including Moab, Utah; Carson Valley and Las Vegas, Nevada; San Bernardino, California; Fort Supply and Fort Bridger, Wyoming; and Lemhi, Idaho.

Deseret petitioned the United States for territorial status, but Congress refused to consider the petition. Anti-Mormon sentiment was still high: President ZACHARY TAYLOR called the Mormons “a pack of outlaws” who “had been driven out of two states and were not fit for self-government.” Territorial status did come soon, but on U.S. terms. In September 1850 Congress created the Territory of Utah, rejecting the name Deseret for one derived from the region’s Ute Indians. The territory’s scale, limited principally to Utah and Nevada and later reduced to Utah alone, was much smaller than that proposed for Deseret. However, President MILLARD FILLMORE, who had succeeded Taylor after the latter’s death from cholera that year, allowed Young to continue holding power as territorial governor, and the territorial legislature continued to be dominated by Mormons. Although Deseret officially ceased to exist, the Mormon Church hierarchy was still the most potent authority in Utah. From at least 1862 to 1870 the State of Deseret was clandestinely revived, with a “ghost” government of Deseret, composed of the same Mormons as those in Utah’s territorial government, meeting in secret as a sign of their commitment to Deseret as originally conceived.

In the meantime, the number of Mormons in Utah continued to grow, to about 40,000 by 1859. They included thousands of converts from England and Scandinavia and, from 1856 to 1860, thousands who came hauling handcarts because they were too poor to afford ox-drawn wagons. By 1869, when the opening of the transcontinental railroad made it easier to come to Utah, the territory’s population had reached 80,000.

The early years were hard. In 1848 crickets devoured much of the harvest, with complete disaster averted only by the intervention of cricket-eating seagulls, an event the Mormons took to be a divine miracle. Young’s efforts to establish industries, such as pottery, cloth, lead, and iron, were largely unsuccessful, though the CALIFORNIA GOLD RUSH provided a bonanza in 1849–50 as the Saints traded and did business with prospective gold diggers passing through Utah. There were some clashes with NATIVE AMERICANS, including the Walker War of 1853, though relations were relatively good, since the Mormons regarded Native Americans as descendants of Israel. The Ute learned to distinguish between “Mormonee” and “Merocats,” or other Americans.

The Mormons’ biggest problem was continuing animosity from white non-Mormons. The Saints had fled to Utah to escape conflict with Gentiles, but now that Utah was a U.S. territory, that conflict was renewed. Polygamy,

which the Mormons began to preach openly in 1852, was considered immoral and barbarous by most Americans. The Mormon tendencies to band together economically and vote in unison were regarded as harmful to free enterprise and free elections. A new Mormon alphabet of 38 letters, which was meant to reform and replace the English alphabet, was viewed by outsiders as a nefarious secret code, while the Mormons' close relationship with Native Americans raised suspicions of treason.

Amid increasing reports of disloyalty and disregard for American law, President James Buchanan replaced Young with a non-Mormon governor, Alfred Cumming, and sent him along with federal troops to Utah in 1857 to put down what he saw as "substantial rebellion" and restore "the supremacy of the Constitution." In what was known as the Utah War (1857–58), the Mormons called in their distant colonists and missionaries and massed in their heartland, ready to defend themselves against what they saw as invaders. Mormon raiders destroyed federal property, but no lives were lost in combat. The affair was settled peacefully, with Cumming becoming governor, while Young remained as powerful as before in his capacity as head of the church. The most serious loss of life, the Mountain Meadows massacre of 1857, involved noncombatants: About 140 non-Mormon migrants bound for California were massacred by Native Americans and Mormon settlers.

Throughout the remainder of the 19th century, the relationship between the United States and the Mormons in Utah remained one of tension. Utah applications for statehood were refused, largely because of the polygamy issue. Congress passed laws against polygamy that were targeted directly at the Mormons, most notably the Edmunds-Tucker Act, or Anti-Polygamy Act, of 1887, which dissolved the corporation of the church, forbade Mormon participation in government, abolished woman suffrage (which the Utah territorial legislature had granted in 1870, 50 years before women nationwide would receive the vote), and otherwise attempted to end the temporal power of the Mormon Church. The standoff did not end until 1890, when the church formally renounced polygamy. Statehood followed in 1896.

The beehive, a symbol of industriousness and a reminder of the meaning of Deseret, is featured in the State Seal of Utah. The *Deseret News*, a newspaper founded in 1850, is still in publication.

## disease and epidemics

As American cities grew in the early 19th century, so did the risk to public health. The urban poor were increasingly crowded in filthy conditions ripe for the spread of infectious disease. The germ theory of disease—understanding the role of microorganisms in causing illness—would not be developed until the second half of the century, but improved trade and transportation were already enabling the swifter spread of germs around the globe. With no clear understanding of disease or how to combat it, it was not surprising that deadly epidemics frequently wracked antebellum America. The problem was compounded by a widespread belief that public health was a private responsibility and that outbreaks were best handled by episodic health boards. These bodies, however, lacked the resources and expertise needed to cope with or even mitigate a problem of such magnitude.

Perhaps the most devastating illness of this period was cholera. Also called Asiatic cholera, it is now known to be caused by the bacterium *Vibrio comma*, which spreads when water and food supplies are contaminated with stools from infected people. The problem was intensified by poor or nonexistent sanitation in regard to public drinking water supplies, especially in urban regions, where contamination directly exposed the entire population to the disease. Cholera causes severe diarrhea, vomiting, and cramps, and, if left untreated, swiftly brings about death through dehydration in more than 50 percent of patients. In 19th-century epidemics, the mortality rate among cholera patients could run as high as 90 percent. Though still endemic in poorer nations, cholera has mostly been eradicated from developed countries by proper sanitation, especially safeguards to keep sewage out of drinking water. But in the early 19th century, when it first became pandemic, or epidemic over a wide region, its speed and brutality made it inexplicable to many except as the scourge of an angry God.

The first major cholera pandemic began in 1817 in India. It spread to most of Asia and East Africa, reaching China in 1820 and Russia in 1823. This first pandemic did not reach western Europe or America, but from 1826 to 1837, a new pandemic did. This one too began in India, reached Russia by 1831, and struck France and the British Isles by 1831–32. Irish immigrants carried it to North America in 1832, where it raged until 1834. It reached New York City in June 1832 and spread south and west across the country, killing thousands of Americans and sending people fleeing in terror from infected places. Wrote one diarist, "To see individuals well in the morning & buried before night . . . is something

The title page of a medical guide published for the Native American population, which was devastated by diseases such as measles and small pox (Hulton/Archive)

which is appalling to the boldest heart.” Nor was the civilian sector its primary victim: Soldiers were disproportionately infected with cholera. In the summer of 1832, for example, an army detachment of 1,000 soldiers under General WINFIELD SCOTT departed Buffalo, New York, for service in the BLACK HAWK WAR in Wisconsin. But cholera sidelined Scott and his entire command. While steaming across Lake Erie, the soldiers suffered a virulent cholera outbreak that quickly reduced their ranks. By the time the expedition docked at Chicago, Illinois, fewer than 200 soldiers remained capable of service.

Many Americans considered cholera a disease of the sinful, visited selectively by God on immoral, dissolute, low-class people with filthy habits. “The cholera is not *caused* by intemperance and filth, in themselves, but it is a

*scourge*, a rod in the hand of God,” wrote one clergyman. Doctors of the time did what they could to save patients, which was very little. Common but futile remedies to treat the disease included bleeding, calomel (a mercury compound), and laudanum (an opium solution). Most physicians believed incorrectly that the disease had a miasmatic or atmospheric origin, arising from filth and foul fumes and spread through the air. One genuine health benefit of this view was the spread of public sanitation measures such as cleaning streets, installing sewers, and collecting garbage. Health reformers such as Sylvester Graham and William Alcott helped spread the view that cleanliness meant health. In many places, quarantines were instituted, though public opinion was divided as to whether cholera was contagious. In any case, the increasing efficiency of trade and transportation in the early 19th century ensured that cholera continued to spread. It was particularly brutal for less privileged members of society, who were frequently crowded together in squalid conditions and without access to safe drinking water.

In 1840 a new worldwide cholera pandemic began, this one killing millions of people into the 1850s. Reaching the United States in late 1848, it had struck every part of the country east of the Rocky Mountains by 1849. In that year of the CALIFORNIA GOLD RUSH, ships from Panama carried the disease to San Francisco, where it advanced throughout California. Meanwhile, in Great Britain, research was beginning to show a way of fighting cholera. In 1854, British physician John Snow demonstrated that cholera was spread through water contaminated by sewage. In one striking case, he brought an end to a local cholera epidemic by removing the handle from a pump that drew water from a sewage-laden area of the Thames River.

Yellow fever was another disease that regularly took epidemic form in antebellum America. Yellow fever is now known to be caused by a virus transmitted through the bites of infected mosquitoes. Symptoms include fever; headache; chills; and jaundice, the yellowing of the skin that gives the disease its name. In the worst cases, the disease ends in death through internal hemorrhage. Endemic in the tropics, yellow fever can spread into cooler regions during warm seasons, as it did repeatedly in the United States in the early 19th century. During epidemics, the death rate could run as high as 85 percent.

In 1819 yellow-fever epidemics struck Baltimore and Philadelphia and reached as far north as Boston. In 1820, one-third of the population of Savannah, Georgia, came down with yellow fever. In 1822, New York suffered an epidemic. After that, areas north of Virginia remained free of yellow fever, but it remained a killer in the South. In 1843, yellow fever swept the Mississippi Valley, killing 13,000. An 1855 outbreak in Norfolk, Virginia, raged so uncontrollably that, according to contemporary accounts, “All Commerce

stopped. The only industry became that of fighting yellow fever." The editor of the *Daily Southern Argus* had to suspend publication because only one employee was left in the plant. The editor wrote, "How doth the city sit solitary that was full of people!"

Dengue fever sometimes swept southern areas as well. Like yellow fever, it is a viral disease carried by mosquitoes, and has similar symptoms—fever, headache, chills, prostration—though it is rarely fatal. The two ailments are so similar that doctors sometimes had trouble distinguishing them, and sometimes epidemics of both occurred simultaneously. In the United States, the first pandemic of dengue fever struck in 1827–28, afflicting Charleston, New Orleans, Pensacola, and Savannah. Another pandemic in 1850–51 caused illness from Georgia to Louisiana.

Other deadly diseases of the period included typhus, which took epidemic form in Philadelphia in 1837; and influenza, which took pandemic form in 1847–48 and 1850–51. Spotted fever was another killer. Known today as meningococcal or cerebrospinal meningitis, this disease is caused by the bacterium *meningococcus*. It received the name spotted fever because it can cause spotting of the skin, along with fever, headache, projectile vomiting, delirium, and convulsions. An inflammation of the membranes of the brain or spinal cord, meningococcal meningitis can be fatal or can leave devastating aftereffects, such as paralysis or deafness. It was a new disease to the doctors who first encountered it in 1805 in Geneva, Switzerland; a year later, it appeared in the United States for the first time, in an outbreak in Medfield, Massachusetts, in which nine people died. Epidemics occurred periodically, notably in 1856–57 in North Carolina and New York State.

Though epidemic disease hit crowded cities especially hard, rural and frontier areas were not free of ailment. Settlers carried disease wherever they went, including Illinois, Indiana, Michigan, and other areas of what is now the Midwest. According to historian of disease Howard N. Simpson, "The most lethal dangers the pioneers had to face were neither savages nor wild animals. They were typhoid, malaria, dysentery, malignant scarlet fever, pneumonia, erysipelas in epidemic form, spotted fever, or what would now be called meningococcal meningitis, and diphtheria."

Certain situations made people particularly liable to disease. Soldiers camped in close quarters in unfamiliar places had reason to fear disease more than bullets. In the MEXICAN-AMERICAN WAR (1846–48), approximately 13,000 Americans died, but only 1,733 were killed in battle. Most of the remaining 87 percent died from disease. Nor did peacetime garrison duty at forts along the frontier ensure healthier conditions. In this respect the principal villain proved to be diet: Military rations consisting of bacon, salt beef, biscuits, beans, grease, and black coffee

left personnel undernourished and susceptible to scurvy. It had long been known that Indians and frontiersmen were relatively free of this condition owing to a regular intake of wild onions, berries, and cactus juice, but the U.S. military was slow to make recommendations. For instance, sensible regulations that encouraged commanders of frontier garrisons to plant gardens and grow their own green vegetables were not promulgated until the middle of the 19th century. Slaves were more prone than their owners to most kinds of disease. Overwork, malnutrition, and poor living conditions increased the susceptibility of slaves to such killers as pneumonia and tuberculosis. However, slaves were more resistant than their masters to yellow fever and malaria, diseases to which the slaves' ancestors had become resistant in Africa.

NATIVE AMERICANS were particularly liable to disease when first coming into contact with white people. Low resistance to previously unencountered germs often resulted in fatal epidemics among Indians, as it had since the time of Columbus. From 1830 to 1833, influenza and other diseases swept through Native American communities in CALIFORNIA, Oregon, and British Columbia. In 1837, a smallpox epidemic ravaged the Mandan, Hidatsa, and Arikara peoples of the upper Missouri River.

Some diseases were specific to certain segments of the population. Women frequently suffered from puerperal fever, or childbed fever, an often fatal illness now known to be a bacterial infection that occurs in women after childbirth because of aseptic, or unclean, procedures during delivery. In 1843 Boston physician Oliver Wendell Holmes, father of the Supreme Court justice of the same name, used case studies to demonstrate that puerperal fever was contagious, spread by physicians who attended childbirths after being in contact with the living or dead bodies of puerperal fever patients. He urged physicians to wash their hands and wear clean clothes to prevent the spread of this disease. His findings were supported four years later by the studies of Hungarian physician Ignaz P. Semmelweis.

Other steps were taken in antebellum America toward improved cure and prevention of disease. One was the establishment in 1820 by New York physician Lyman Spalding of the *U.S. Pharmacopoeia*, a government-approved list of medical drugs that set standards for their formulation and purity. This prescient document advocated the creation of the first state boards of health, the statewide collection and analysis of disease statistics, an official smallpox vaccination program, health education programs for children, improved sanitation and ventilation of school buildings, state care programs and facilities for the mentally ill, and extensive preventive medicine instruction for all physicians and nurses. Another was the founding of the American Medical Association, inaugurated in 1847 to promote medical knowledge and maintain

standards for medical education and ethics. These far-sighted suggestions were largely ignored by the political establishment. Another spate of cholera epidemics in 1849 and 1854 finally spurred a broad movement to establish full-time public health boards, and the cholera episodes ceased. The first conventions held by sanitary reformers in 1857 and 1860 marked the beginning of improved national sanitation and disease control efforts.

### **Dix, Dorothea** (1802–1887) *mental health reformer*

Almost single-handedly responsible for changes in the way that mentally ill individuals were treated in 19th-century America, Dorothea Dix was one of the most effective activists and reformers of the era. Born on April 4, 1802, Dorothea was the eldest child of Mary Bigelow Dix and Joseph Dix, a traveling preacher. Her childhood—spent in Hampden, Maine, and Worcester Massachusetts—was dominated by her mother's ill health, her father's alcoholism, and the responsibility of caring for her two younger siblings. At the age of 12, Dix was sent to live with her wealthy grandmother in Boston, but she found adjustment to her new social status extremely difficult. By the age of 14, she was back in Worcester, living with her great-aunt. During the next year Dix began her career as a teacher, founding a dame school for young girls in the area. After breaking off an engagement in 1821, she returned to her grandmother's house in Boston and continued to teach there until the mid-1830s. Dix also published a number of books, including *Conversations on Common Things* in 1824, *Hymns for Children: Selected and Altered* in 1825, and *Meditations for Private Hours* in 1828.

Dix suffered from poor health through most of her life, and by the mid-1830s she was extremely sick with what many scholars now believe to be tuberculosis. She traveled to England to recuperate, staying at the home of the

Dorothea Dix (Hulton/Archive)

Rathbone family. There she met a number of intellectuals and activists, including Dr. Samuel Tuke, whose family was involved in mental health-care reform in England. During her convalescence, Dix learned that her mother and grandmother had died and that she had inherited enough money to give up teaching on her return to the United States. Influenced by the religious beliefs of her Methodist upbringing and her Unitarian sympathies, Dix took the opportunity to look for ways in which she could make the best use of this financial freedom.

In March 1841 Dix was invited to establish a Sunday school class in the East Cambridge House of Correction, Massachusetts. The conditions she witnessed inside the jail appalled her. Mentally ill individuals had been thrown into cells with criminals of every degree, left unclothed, without heat, and lacking anything but the most basic sanitary provisions. Many inmates were found chained to walls and had been flogged in an attempt to control their behavior. Determined to change the situation, Dix set out to tour prisons throughout Massachusetts. Her experience in East Cambridge was repeated over and over again, and Dix carefully cataloged the conditions she observed. In 1843 she submitted a report on her work to the Massachusetts legislature and lobbied fiercely for the overhaul of the penitentiary system. Thanks to her efforts,

a law was passed to facilitate the expansion of the Worcester State Hospital in order to provide better care for the mentally ill.

Dix's career as a reformer had barely begun. Over the next 11 years, she toured prisons across the eastern United States and lobbied other state legislatures for changes in the treatment of the mentally ill. In 1845 she published *Remarks on Prisons and Prison Discipline in the United States*. As a direct result of her efforts, 15 states passed reform legislation, and 32 hospitals for the mentally ill were built.

In Dix's opinion, wholesale reform in mental health care could only be achieved with the assistance of the federal government. Dix repeatedly lobbied Congress to sell parcels of public land and channel the proceeds into the treatment of the mentally ill. Congress voted on the issue twice, rejecting the idea in 1848 and passing it in 1854. Vetoed by President Franklin Pierce, however, the legislation was never put into effect. Drained by the demands of her reform work, Dix left the United States that same year, hoping to be able to rest.

Once in Europe, however, Dix continued to work on issues of mental health reform, visiting jails across the continent over the next two years. At each stop, she advocated the building of new hospitals and better training for prison and hospital staff. In Italy, Dix personally persuaded Pope Pius IX to become involved in her cause and to witness the conditions in local jails.

Dix returned to the United States in 1856, where she continued her reform work despite lasting difficulties with her health. She would go on to become chief superintendent of nurses for the Union army during the Civil War, a job for which she was not well suited. After peace was declared, Dix continued to work as a reformer until her health deteriorated to the point at which she needed hospital care. In 1881 Dix admitted herself into the state hospital at Trenton, New Jersey, a hospital she had founded. It was there she died on July 17, 1887.

### Donner party (1846–1847)

This disastrous emigrant expedition to CALIFORNIA, which began in spring 1846, was planned by two prosperous brothers, Jacob and George Donner. The Donners were among the earliest and most successful settlers to begin farming in Sangamon County, Illinois, near Springfield. Along with hundreds of others at this time, the brothers

were drawn by the lure of California and decided to uproot their families and head further west, searching for even fairer prospects. They were inspired to make the journey by reading the *Emigrant's Guide to Oregon and California*, an enthusiastic promotion of western settlement written by Lansford W. Hastings.

Hastings had encouraged his readers to follow a new and quicker route over the mountains, which he dubbed the "Hastings Cutoff." Instead of following the established CALIFORNIA TRAIL, Hastings suggested emigrants leave it at Fort Bridger and head towards the Great Salt Lake. The Donners decided to follow his advice. Their group, which now included the James Reed family and numbered 31 people in nine wagons, left from Springfield in April 1846. After reaching Independence, Missouri, they joined a wagon train captained by Colonel William H. Russell. The larger party traveled along the Platte River for a month, reaching FORT LARAMIE, Wyoming, where they discussed the Hastings Cutoff with a mountain man, James Clyman. Clyman had just traveled the route with Hastings himself and warned them not to take the cutoff, but they learned from another traveler that Hastings had promised to meet emigrant groups at Fort Bridger and lead them through his cutoff personally.

Now known as the Boggs company, the group continued on and, in mid-July, a large number decided to follow Hastings's shortcut and elected George Donner as their captain. Now known as the Donner party, they reached Fort Bridger a week later but found that Hastings had already gone, leading a different party across his trail. After resting for a few days, they continued on, hoping to catch up with him. Soon after, a few members of the party, led by James Reed, traveled ahead to find Hastings and get his advice. With the addition of other emigrants, the Donner party now numbered 87 people and 23 wagons. Reed's group soon returned with more specific directions.

The party crossed the Great Salt Lake Desert at the end of August, a trek that took six days, not the two that Hastings predicted. After this arduous leg of the journey, almost all the cattle were dead or lost, and food supplies were getting low. Donner sent two men ahead to Fort Sutter to obtain more supplies. At the end of September, they reached the California Trail, which they followed along the Humboldt River for two weeks. Tensions among the emigrants began to flare. In early October, James Reed killed another man in the party during a dispute. The party banished Reed from the wagon train, and he traveled ahead to find supplies. Troubles continued to multiply as they encountered hostile Paiute raiders, who killed at least one straggler unable to keep up with the wagon train.

The Donner party reached the Truckee River in mid-October and began their grueling journey across the Sierra

Nevada. But they had lost precious time following a route that proved much longer and more difficult than Hastings had promised. Before they reached the pass through the mountains, snow stopped their travels. Some emigrants constructed makeshift cabins near the Truckee Lake, while others camped near Alder Creek. They waited, hoping this early snow was a fluke occurrence and would soon melt. But the snowfall persisted, and their attempts to cross the mountains failed. Although some supplies had been brought back from Fort Sutter, provisions remained meager, and they had slaughtered all their remaining livestock by the end of November. By mid-December, a small group known as “Forlorn Hope” set out on snowshoes to find help. Soon the Truckee Lake group learned that several people at the Alder Creek camp, including Jacob Donner, were dead. In late December, the Forlorn Hope expedition was caught in a blizzard, and many of their number died. The remaining people, out of food, were forced to eat their remains.

Seven members of the Forlorn Hope group survived, arriving at Johnson’s Ranch in mid-January 1847. Word spread about the disasters that had befallen the Donner party, and in San Francisco, settlers began to plan rescue missions and raise money. Back at Truckee Lake, members of the Donner party began to die in large numbers. The first rescuers arrived at the lake in mid-February and found that 11 people had died; the rest were traumatized and weak. When the relief party began the journey west, they took 23 refugees with them. The second relief mission, led by James Reed, arrived at the lake on March 1 and learned that the remaining migrants had, like the Forlorn Hope group, resorted to cannibalism. The rescuers left with 17 people, but this party was trapped by a blizzard. A third rescue party reached them at “Starved Camp,” then continued on to the lake and creek camps, where they found few migrants still alive. Most were too weak to travel. By the time the fourth rescue party arrived, only one man was still alive, surrounded by the horrifying evidence of cannibalism. Of the 89 original members of the Donner party, only 45 survived. All the rest, including George Donner, perished. Their journey became famous as the most horrible tragedy to befall emigrants heading for California.

**Douglass, Frederick** See VOLUME V.

**Dow, Lorenzo** (1777–1834) *American Methodist preacher*

One of the most influential preachers of the early republic, known for his animated, fervent speaking style, Lorenzo Dow traveled across the United States and Great Britain, spreading his impassioned evangelism through camp meetings and other revivals. He was born in Coventry, Connecticut, in 1777, the fifth child of Humphrey and Tabitha (Parker) Dow. According to his own writings, he was drawn to spiritual matters from an early age.

In 1794 Dow began traveling and preaching. Two years later, he became associated with the Methodists, who assigned him to a circuit in New York State. This connection with an established church was short-lived because of Dow’s unconventional exhortations. He continued to live as an impoverished itinerant preacher, often covering more than 100 miles in a week on horseback. The Methodist Conference readmitted him in 1798, but he almost immediately created new controversy when he went to Ireland in an unappreciated attempt to convert Roman Catholics. After this controversy, his formal association with the Methodists ended, but not his own adherence to Methodist doctrine as he saw it.

Returning to the United States after 18 months in Ireland, Dow sailed to Georgia to preach, went briefly to New York, and then returned to the South in 1802 for an extended evangelizing tour. His hellfire-and-damnation style of preaching won many converts in the newly settling inland South. He evangelized among both Indians and pioneering whites, preaching the first Protestant sermon in the Tensaw and Tombigbee settlements in Alabama in 1803. Dow also toured Tennessee, Virginia, and the Carolinas, offending some and inspiring others.

He returned to New York in 1804 to marry Peggy Holcomb, who agreed to allow his nomadic ministry to take highest priority; he returned to the South to preach on the day after their wedding. He continued to shuttle back and forth between New York and the southern states, and then embarked for England with Peggy, who gave birth to a daughter while they were abroad; the baby died soon after. In England, Dow popularized the camp-meeting revival and inspired the formation of the Primitive Methodists. Returning to the United States in 1807, the Dows resumed their revival tours across the country. Lorenzo Dow’s reputation as a charismatic preacher grew, and he often referred to himself as “Cosmopolite,” a wealthy and dashing prophet. As he railed against vice, Dow dazzled audiences with his dramatic long hair and convulsive movements. His wit, charm, and fierceness were especially compelling to back-country settlers living under harsh conditions.

Peggy Dow continued to support his enterprises until her death in 1820. Soon after, he remarried and began to settle into a more sedentary, but still vigorous, lifestyle. He

wrote journals and kept publishing numerous pamphlets, as had been his practice for several years. These religious tracts were as much self-promotion as they were spiritual instruction. Dow published several volumes, including sermons and accounts of the controversies he inspired. Notable among these publications were *Polemical Works* (1814) and *History of a Cosmopolite, or, the Writings of the Rev. Lorenzo Dow, Containing his Experience and Travels in Europe and America* (1848). He remained a persistent antagonist towards his opponents—namely Whigs, Catholics, and established Methodists. Lorenzo Dow died in Washington, D.C., in 1834. While always a maverick in American Protestantism, he greatly influenced mainstream spiritual beliefs and practices during the early decades of the 19th century.

**Drayton, William H.** (1776–1846) *American planter, lawyer, and politician*

The South Carolina politician William Drayton was born in St. Augustine, Florida, on December 30, 1776, the son of a chief justice of the province. He was educated in London until the death of his father in 1790, when he moved to Charleston, South Carolina. Drayton studied law on his own, was admitted to the bar, and gradually gained renown as a leading attorney. In 1806 he gained a seat in the state House of Representatives as a Federalist, where he served two years.

Drayton, like most Federalists, opposed the WAR OF 1812 against the British. He nonetheless extended his services to the government. On March 12, 1812, he was appointed lieutenant colonel of the 10th U.S. Infantry, and he rose to the rank of full colonel and inspector general on

August 1, 1814. Drayton saw no action in the war, but he handled his administrative duties so admirably that in 1816 General ANDREW JACKSON recommended him to President JAMES MONROE for secretary of war. When that position went to JOHN C. CALHOUN, Drayton resumed his legal practice in Charleston, rising to city judge. He also became politically active in the nascent DEMOCRATIC PARTY, and in 1825 he gained election to the U.S. House of Representatives to replace a seat vacated by Joel R. Poinsett.

By this time the nation was becoming embroiled in controversy over tariffs, which favored northern industrial states and penalized agricultural states like South Carolina. Drayton staked out a position as head of the South Carolina Unionists, and in this capacity he opposed the imposition of high tariffs but also rejected any attempts at nullification or secession. During the stormy winter of 1832–33, Drayton was instrumental in persuading President Andrew Jackson not to dispatch federal troops to South Carolina, although he secretly provided the government with intelligence as to nullifier strength and intentions. The NULLIFICATION CONTROVERSY finally was resolved following passage of the compromise Tariff of 1833, which Drayton strongly endorsed. He finally left Congress in March 1833.

Once out of office, Drayton moved to Philadelphia, Pennsylvania, as a private citizen. In 1840 he reentered the public sphere as president of the Bank of Philadelphia, previously known as the Bank of the United States, and oversaw the liquidation of its assets. Drayton died in Philadelphia on May 24, 1846, a well-regarded leader of the southern Unionists in Congress.

## **Easton, Hosea** (1798–1837) *abolitionist, minister*

Hosea Easton was a prominent African-American abolitionist. He was born on September 1, 1798, in Middleborough, Massachusetts, to a family of mixed African, white, and NATIVE AMERICAN heritage who had carved out a niche for themselves within the regional black elite. His father was James Easton, a veteran of the Revolutionary War and a skilled ironworker.

Little is known of Easton's youth or education, but in 1828 he wrote his first tract, "Thanksgiving Day Address," for blacks living in Providence, Rhode Island. In time he became known as one of the leading African-American abolitionists of New England. Not simply exhorting blacks to excel, he was unique among his contemporaries for also demanding that whites consider the debilitating effects of racism on their black neighbors.

In 1831 Easton was a delegate to the first National Colored Convention in Philadelphia, Pennsylvania. One outgrowth of this undertaking was his attempt to found a manual labor school for black youth in Hartford, Connecticut; this failed, however, owing to entrenched white resistance. Easton served as president of the Hartford Literary and Religious Institution, founded in 1834 and dedicated to the moral and social uplift of blacks. Two years later he became pastor of the Talcott Street Congregational Church in Hartford. Racial tensions in Connecticut ran extremely high at this time. In 1836 Easton became the first pastor of the Methodist Episcopal Zion Church, but it was shortly burned down by enraged whites. Easton immediately led a funding drive to rebuild the church.

In the following year he published his seminal tract, *Treatise on the Intellectual Character, and Civil and Political Condition of the Colored People of the United States*, which addressed the discrimination facing the black community in a comprehensive and erudite manner. Here Easton again pleaded with whites to consider the negative effects racism had on their respective communities, invoking scripture in support of racial equality. He steadfastly

maintained that all people, regardless of skin color, were created by God and that blacks should celebrate, not denigrate, their African heritage. Easton died in Boston, little recognized, in 1837.

## **economy**

The American economy, the nation's system for producing and distributing wealth, grew dramatically in the period 1813–55. Growth was fed by an expanding land base, a burgeoning and productive population, industrialization, an improved transportation system, and technological advances. It was facilitated by a stable government that encouraged private enterprise and investment, and it was fueled by the ambition, energy, and creativity of Americans. However, the generally bright economic picture contained dark areas. The economy was periodically rocked by panics, or financial alarms leading to depressions. The BANKING AND CURRENCY systems were unstable. The gap between rich and poor was growing, with NATIVE AMERICANS and enslaved AFRICAN AMERICANS left out of the nation's growing prosperity. Furthermore, a serious divide was developing between the economies of North and South, the former increasingly based on manufacturing and the latter on cotton farming by slaves. But, overall, the majority of Americans did in one way or another benefit from the new opportunities afforded them throughout the antebellum period.

By any measure, the antebellum economy was surging. Per-capita real gross domestic product increased by 60 percent from 1800 to 1840. Real reproducible wealth per capita, a measure of how much wealth each American

possessed, grew from \$166 in 1805 to \$441 in 1850 (in 1929 dollars). In the late 1830s, the United States began to export more goods than it imported.

This rise of a truly national market economy was aided by the liberal economic theory of Adam Smith, the 18th-century British philosopher. Simply put, Smith embraced a notion of rugged entrepreneurialism, whereby individuals pursuing their own self-interest in a free marketplace were the best agent for generating wealth for themselves. The expected result, Smith said, would invariably come in the form of inexpensive goods and services, accompanied by a rise in wealth for that individual and everybody connected to them. Smith's philosophy resonated strongly with ANDREW JACKSON, who viewed his age as the "Age of the Common Man," and Americans proved both willing and innovative in the pursuit of free trade. Unlike in Europe, birth and title meant little in the free-market battleground of the United States in the early 19th century, and people's prosperity depended principally on their intrinsic talent for making money. Opportunities in new technologies and their economic application abounded throughout the antebellum period, and restless Americans, aided by an influx of equally eager immigrants, sparked and sustained a period of unprecedented economic growth.

Territorial expansion was crucial to American economic growth in this period. In the TREATY OF GHENT (1814), which ended the WAR OF 1812, Britain acknowledged undisputed American possession of the Northwest Territory, or the Old Northwest, an expanse of 266,000 square miles that comprises what are now Indiana, Illinois, Ohio, Michigan, Wisconsin, and eastern Minnesota. Farther west, the Louisiana Purchase of 1803 added an additional 800,000 square miles of territory, while the acquisition of Florida (1821), the annexation of TEXAS (1845), the

OREGON TREATY (1846), the Mexican cession (1848, comprising California and the Southwest), and the GADSDEN PURCHASE (1853) brought the United States to its present continental borders. From 1800 to 1860, the territory of the United States more than tripled.

Population growth more than matched territorial expansion. Thanks to natural increase and surging immigration from Ireland, Germany, and elsewhere, the U.S. population rose from fewer than 4 million to more than 31 million from 1790 to 1860. Much of the new territory was in the public domain, and the government made it available to settlers at low prices. In 1832, for example, a family could buy 40 acres of public land in the West for \$50. As a result, pioneers to settle and create wealth in the new territory were easy to find. The percentage of Americans remaining in the East fell every decade from 1810 to 1860, so that by the latter date only 50 percent of Americans lived east of the Appalachians.

In the North, the Old Northwest attracted so many settlers that the region soon produced more agricultural goods than the Northeast, supplying sufficient food to allow the latter region to specialize in industrial production. In the South, farmers moved west to Alabama and Mississippi, in pursuit of new land for growing cotton, while the United States forced Native Americans in those areas to give up their lands and relocate farther west.

Another key to the nation's growth was an efficient transportation system. Frontier farmland was a worthless investment if crops could not be gotten to market. With federal and state aid, turnpikes proliferated throughout the antebellum period, including the NATIONAL ROAD, which linked Washington, D.C., with the Ohio Valley in 1818 and reached Vandalia, Illinois, by mid-century. By 1840 so many major arteries had been built east of the Mississippi that few others were added until the 20th century.

Waterways were even more attractive than roads for transporting goods, since a heavier load could be carried more cheaply on a barge than on a wagon. Steam power contributed to the growth in water traffic, by allowing goods and people to be shipped cheaply against a river's current or in the absence of favorable winds. Steamboats first became commercially viable in 1807, with American engineer Robert Fulton's launch of the *Clermont*. After the War of 1812 steamboats multiplied exponentially on the Mississippi River and its tributaries, opening up Midwestern farm products to larger and more lucrative markets at New Orleans and beyond. The steamboats also constituted a relatively cheap and reliable system of transportation for the new wave of settlers traveling through the region. Where rivers and lakes did not connect with each other, canals were dug. By 1840, the nation had more than 3,000 miles of canals, including the ERIE CANAL, completed in 1825 and 13 times longer than any previously attempted.

It spanned 365 miles from Albany to Buffalo, linking the Hudson River and the Great Lakes. The opening of the canal led to a dramatic drop in freighting costs from 20 cents a ton per mile to only two cents, again to the advantage of both producers and consumers.

Railroads provided yet another transportation solution, one that soon eclipsed that of canals. The first railways, opening in the 1820s, were horse-drawn, but the steam locomotive was vastly more powerful, as Peter Cooper demonstrated in 1830 with the *Tom Thumb*, the first U.S.-built locomotive. By 1860, the country was crisscrossed by about 30,000 miles of railroad track laid down by many railroad companies, including the BALTIMORE & OHIO RAILROAD (B&O), the Pennsylvania Railroad, Pacific Railroad, and New York Central Railroad. The amount of track dwarfed the total railroad track laid elsewhere in the world and greatly reduced the travel time between major metropolitan centers. For example, by 1850, the time required to travel the important route between New York on the Atlantic coast and Chicago in the interior, previously six weeks, fell to only three days. The transportation revolution played an essential role in the explosion of the American economy and the ceaseless migration west.

The growing web of transportation served an economy that was still largely agricultural. As late as 1860, agricultural products accounted for 82 percent of U.S. exports. Leading American agricultural products included corn, wheat, rice, livestock, cotton, and tobacco. Most farmers practiced both subsistence and commercial AGRICULTURE, meeting their own country's food needs while also producing goods for export. The South was particularly agricultural in character; as late as 1860, more than 75 percent of southern workers were farmers, with most of the rest involved in processing or otherwise handling agricultural products.

Yet the national economy as a whole was beginning to be industrialized, moving away from an agricultural basis toward one based on large-scale, mechanized factory production. The South's most profitable crop, cotton, was shipped to northern factories and transformed into textiles. The proportion of American workers engaged in agriculture declined from 71.8 percent in 1820 to 58.9 percent in 1860. By 1849, manufacturing was the economy's most rapidly growing segment.

Industrialization in America began with New England's textile industry, which flourished throughout the antebellum period. Entrepreneurs such as Samuel Slater and Francis Cabot Lowell adapted British textile machinery for use in American factories, including those in Lowell, Massachusetts, incorporated as a city in 1836. By 1840, about 2.25 million spindles were at work producing cotton cloth in 1,200 factories, most of them in New England. Woolen manufacturing also advanced during this period, as did

other industries, everything from guns in Connecticut to straight pins in New York. From 1810 to 1850, the annual output of pig iron grew from 50,000 to 600,000 gross tons. Manufacturers such as Peter Cooper, SAMUEL COLT, Eleuthère Irénée Du Pont, William Colgate, and William Procter and James Gamble began to make fortunes that rivaled those of contemporaries such as CORNELIUS VANDERBILT, who made his money with shipping, and JOHN JACOB ASTOR, who made it with fur and real estate.

The rise of the factory system ushered in a gradual and unforeseen transformation of women's status in America. Textile mills set the precedent by demanding large numbers of unskilled but fairly intelligent workers, and these jobs proved an ideal outlet for young, unmarried, middle-class women, who constituted the nation's first wave of factory workers. Factory work involved living in dormitories and working long hours, but the women drew \$3.20 per week, roughly twice what they could expect as seamstresses, washerwomen, or domestic servants. They in turn acquired an independence heretofore unattainable in the close confines of village life, where most women were not expected to work outside the home. Nor did they passively accept their lot; in 1836, when the Lowell managers reduced their wages, 2,000 women walked off their jobs in protest and had their pay restored. By mid-century women were beginning to be replaced by male immigrants, who were not averse to working long hours at meager wages. At the same time females replaced many males in the teaching profession, and from this position many, such as Susan B. Anthony, began agitating for better social conditions and rights for women in general. Thus, the introduction of new technology and the mass participation of women in work outside the home leveled society's playing field in many respects. This set the groundwork for a gradual improvement of conditions for women.

Technological innovation brought growth in both the agricultural and industrial sectors, including CYRUS HALL MCCORMICK's mechanical, horse-drawn reaper (1831); Charles Goodyear's process for vulcanizing rubber, rendering it elastic in all weather (1839); and SAMUEL F. B. MORSE's telegraph, a form of long-distance communication by wire (demonstrated in 1844). Federal and state government support also helped, including tariffs that protected domestic industries, tax exemptions, monopoly privileges, and laws that made it easy to organize corporations and obtain financing.

For economic growth to occur, capital (accumulated wealth) was needed to finance land purchases and new business enterprises. Most entrepreneurs in the young nation had relatively little capital, but they found financing from a variety of sources, including direct or indirect aid from federal and state governments, loans from banks, sales of stock to investors, and capital from overseas, mainly

Britain. Up to 1839, Britain had invested more than \$170 million in American businesses. Capitalization in general was growing rapidly. From 1820 to 1840, capital funds invested in the nation's factories grew fivefold, from \$50 million to \$250 million.

Banks played an important role by pooling capital, in the form of deposits, and lending it out at interest to those who could put it to use. Most banks were state-chartered institutions, known as state banks, each with a reserve of gold and silver, known as specie, and its own paper money, issued in the form of banknotes. (Both gold and silver could be coined freely at the time, a monetary system called bimetallism, though by mid-century gold was increasingly displacing silver as the preferred coin.) In the absence of a uniform national currency, the spread of banknotes as a fluid medium of exchange was itself a spur to economic development, especially in frontier areas, where farmers otherwise had to rely on awkward media such as animal pelts or old foreign coins to complete transactions. The banks' loans—for construction, manufacturing, commerce, agriculture, and other enterprises—further stimulated growth. One study found that commercial banks supplied about 90 percent of the short-term credit needs of eight prominent textile mills in Massachusetts.

Although state banks were important in fueling economic expansion, they were also a source of economic instability when they printed too many banknotes or extended credit out of proportion with their reserves. They thereby contributed to panics, financial collapses that resulted when frightened depositors, no longer confident in the banks, tried to withdraw their deposits en masse, and banks responded by calling in loans from borrowers who could not pay. Panics struck in 1819, 1837, and 1857, each time with devastating consequences for those thrown out of work or left with worthless banknotes or foreclosed property.

Proponents of a federal central bank twice established a Bank of the United States to exert a stabilizing influence by refusing to accept banknotes from state banks not redeemable in specie actually possessed in their vaults. The first Bank of the United States lasted from 1791 to 1811, the second from 1816 to 1836. Political opposition brought about the demise of both. In the second case, President ANDREW JACKSON led the opposition, arguing that the SECOND BANK OF THE UNITED STATES was anti-democratic and served the exclusive interests of wealthy eastern businessmen against farmers and western frontiersmen. Jackson waged a successful "Bank War" in Congress to ensure that the bank's charter was not renewed in 1836. Even before then, he drained the bank's assets, shifting them to state banks called "pet banks."

With income from tariffs and the sale of western public lands, Jackson succeeded in paying off the national debt

in 1835. But his economic victories were short-lived. The risky speculation of the pet banks and of even more reckless institutions called wildcat banks led to higher interest rates and rampant inflation. In response to the growing financial chaos, Jackson in 1836 issued the Specie Circular, which declared that only gold and silver coin would henceforth be acceptable for purchase of public lands. Taking the Specie Circular as a sign that paper money had lost its value, investors rushed to their banks to demand that their banknotes be exchanged for specie. The result was the PANIC OF 1837. The ensuing slump, part of a worldwide depression, lasted seven years and left a trail of closed banks and failed businesses. One unexpected outcome of the panic was a mass migration of debt-ridden Americans to the frontier, especially to Texas, which was newly independent and promised new arrivals free homesteads. Within a decade its population surged from 30,000 to 146,000. Other families wishing to escape creditors and start new lives triggered the initial surge of settlers headed for Oregon and CALIFORNIA, both of which would be in American hands by mid-century.

In 1846 Congress tried again to add a stabilizing force to the economy with the Independent Treasury System. Federal funds were placed in an independent treasury, or subtreasury, system separate from all banks, with all payments to and by the federal government in specie. The Independent Treasury System restrained overspeculation, but it also kept specie out of the market and tightened credit excessively. Meanwhile, banking abuses, such as overspeculation, remained commonplace, and currency remained confusing, with each bank issuing its own notes. The National Currency Act (1863) and the National Bank Act (1864) helped by creating a national banking system and national currency alongside the state banking system.

As the economy grew, society changed and new social tensions emerged. The lure of factory jobs drew immigrants and rural residents to towns and cities, increasing such urban problems as poor sanitation and epidemic disease. During the 1840s, towns and cities of 8,000 or more people grew by 90 percent, a rate much greater than that of the U.S. population as a whole (36 percent). Economic inequality grew as wealth became concentrated in fewer hands. A growing class of factory wage laborers took the place of a shrinking class of independent artisans and craft workers. From 1774 to 1860 the share of wealth owned by the top 1 percent of Americans grew from 13 to 29 percent. While industrialization improved standards of living by lowering prices for manufactured goods, in many cases it also made for bad working conditions. In the 1830s, labor unions began to grow as workers protested wage cuts and demanded that workdays be reduced from 13½ to 10 hours.

The most serious national tension in this period was that between North and South, which worsened as a result of economic change. North and South were increasingly

becoming two nations, the former progressing through industrialization, the latter stagnating as a result of its commitment to a single crop, cotton, and an economically inefficient system of mobilizing labor, SLAVERY. Up through the mid-century, southern cotton proved indispensable to New England and mid-Atlantic textile mills, whose business leaders enjoyed cordial and profitable relations with aristocratic planters of the Cotton Belt. But perception changed through the agitation of abolitionists, who gradually turned public opinion against slave labor. That system was increasingly viewed by northerners as morally intolerable and defended by southerners as indispensable. The two societies, with their radically different economies, ultimately clashed in the cataclysm of the Civil War (1861–65).

## education

American education in the first half of the 19th century was marked by idealistic reform and economic necessity. Its development was closely tied to the needs of a growing and geographically expanding populace as well as to the desires of a country determined to distinguish itself from Europe, in part by developing public and private roles for educating the country.

In 1797 the American Philosophical Society sponsored a contest requesting essays on a “system of liberal education and literary instruction, adapted to the genius of the govern-

ment of the United States.” Generally, the essayists called for an educational system that would create a literate citizenry who could support and defend the new country. Two decades earlier, in 1779, Thomas Jefferson envisioned a more expansive plan for a national school system that spanned free grammar schools to universities and encompassed training in the classical and modern arts and sciences. Further, he posited that those who excelled at school, whatever their social rank, should be called on to be the nation’s leaders. This, he believed, would bring fresh ideas to the nation. Yet despite agreement on the importance of education among early American thinkers and philosophers, it took much of the first half of the 19th century to transform the government and its people into supporters of regulated public education.

In the early 19th century, movement toward public education began slowly. Most elementary schooling at the time occurred in the district school. Funded through taxation of district households, it was open to all children of the community, usually from ages three to 17. In the average school, students of all ages shared the same single classroom.

Beginning in the 1820s, Whig-affiliated educational reformers introduced one of the most successful movements of the century, the public-school program called the common school movement. Headed by leading thinkers such as Henry Barnard and HORACE MANN, the movement pushed for the public education of all elementary-age white children in local schools supervised by the state and regularized under the guidance of state boards of education.

Mann, in particular, was instrumental in promoting the common school and public education. A lawyer and Massachusetts state legislator, he became the first secretary of the Massachusetts Board of Education in 1837, in answer to a desire to engage in good works following his wife’s death. He served in this role until 1848, working to raise statewide support for public education. He spoke throughout the state on how public education promoted an efficient workforce and a culturally and personally enriched citizenry. Through his *Common School Journal*, teachers gained pedagogical skills; through his annual reports, circulated nationwide, the country became interested in public education. Also through his efforts, public school-teachers’ salaries were increased substantially.

Over the course of two decades, school construction increased, and by the mid-19th century, there were many varieties of educational facilities in the United States, reaching increasing numbers and types of students. In 1830, combined attendance for white students between five and 19 years of age was 35 percent; by 1850, it had increased to 50.4 percent. Public common-school attendance in 1850 totaled about 4 million, or over 55 percent of the common school-age population. The greatest number of public schools were located in New England, followed

This engraving shows a white teacher barring African-American children from entering a school. (Library of Congress)

by the Midwest, while public schooling in the southern states would become commonplace within the next half-century.

Other changes accompanied this rise in school attendance. One was the development of mass teaching materials, particularly schoolbooks. While 18th- and early 19th-century children had been trained on Noah Webster's *American Spelling Book* and the Bible, many mid-19th century public schoolchildren learned from professor and Presbyterian minister WILLIAM HOLMES MCGUFFEY's *Eclectic First Reader* and its later editions. First published in 1836, the books were graded readers that presented a wide variety of material reinforcing Western morality and ethics as well as a common culture. By 1857, six McGuffey editions had been published, with 7 million copies sold.

Another change begun in the antebellum years was an increase in the number of female schoolteachers. Formerly a male preserve, the growing number of schools created a need for morally upright, low-wage sources of labor in large quantity. The feminization of education was championed by educator and reformer Catharine Beecher. Founder of academies for women, she wrote works including *An Essay on the Education of Female Teachers* (1835), which proclaimed that the expertise of women in developing moral sensibility would make them superior teachers. She also understood that teaching was one of the few professions open to women. Together, Beecher's moral and practical arguments served their purpose and turned the teaching profession into a women's bastion by the post-Civil War years.

Higher education was represented in great numbers of schools but educated relatively few students. According to estimates in the *American Journal of Education*, 6,000 academies existed in the United States in 1856, serving approximately 250,000 students. Given that the prewar secondary school-age white population of 15 to 24 totaled about 4.1 million, this meant that between 10 and 15 percent of students were receiving higher education.

While overall involvement in higher education was lower than it was for primary grades, the increasing number of academies represented a commitment to U.S. secondary education.

This commitment extended to colleges, with several dozens founded between the American Revolution and the American Civil War. According to the *American Almanac*, 46 colleges were established by 1831; less than two decades later, the 1850 census listed 119 colleges. Many of these antebellum schools have been long-lived: Sixty-six of the 173 colleges lasting into the 20th century were founded in the 1850s. Notably, these colleges were established across the United States, not concentrated in one region. This development also attested to a national interest in developing educational outlets.

As the number of U.S. colleges grew, so did the percentage of college-educated students. According to historical estimates, in 1830, 17 out of 10,000 students had received some form of American college education. In 1850, the number had risen to 1.25 percent of the U.S. college-age population.

Despite this overall increase in college attendance, more sites for higher education were built than the populace could use. One reason for this overdevelopment in the first half of the 19th century was the financial worth of an academy or college to a new community. The promise of such an institution brought more settlers and more money to a community than did an elementary school.

Most of these antebellum schools were affiliated with religious denominations. In large part, these affiliations to various Christian denominations reflected the religion of the community and those leaders who would support the institution. In this early part of the 19th century, the affiliations were less concerned with the particulars of the religion than in providing a source of financial support. To convey their own religious tenets, many of these civic-minded school supporters would build their own religiously grounded colleges.

Befitting the many changes to education during the period, higher education was also being transformed, particularly at elite schools. After centuries of a standard classical curriculum, the educational programs at colleges such as Harvard or Yale were about to change. Up until the 1820s, students followed a course of study that included learning Latin and Greek languages and history in order to prepare them for entry into the professions. Specialized study of subjects was seen as secondary.

As late as the 1820s, this support of the classical standard was upheld by public statements such as the Yale Report of 1828, but several factors would change this approach. Among these factors were the pervasive effects of atheistic Enlightenment thinking; inadequate college teaching of the classical languages, which diluted their

power; and the move toward granting specialized degrees in subject area and level of schooling. By the 1850s, religiously affiliated colleges were undergoing a period of transition that culminated in higher educational reform in the post-Civil War years.

Along with the founding of colleges was the flourishing of learning through noninstitutional means such as newspapers, agricultural fairs, and particularly the adult-education program known as the lyceum. Begun in 1826 in Massachusetts, lyceums soon expanded nationally, and within a decade, several thousand such institutions were operating. Culture in variety was the lyceum's hallmark, with major lyceums such as the Cooper Union in New York City presenting speeches and demonstrations by writers, artists, and statesmen. The lyceum was influential in promoting a national culture and ideas of social progress.

Throughout the first half of the 19th century, hundreds of thousands of AFRICAN AMERICANS faced increasingly stringent codes that forbade slave education. Although this undercut the 18th-century move toward building African free schools in the cities, educational training still continued, privately, among African Americans and with whites, though the literacy rate among slaves stood at about 5 percent. Just before the Civil War, in 1855, Boston became the first city to integrate its public schools.

By the mid-1850s, school enrollment on all levels was rising, mirroring growing government support and an increasing population, much of it foreign-born. With 50 percent of the population of New York City born outside the United States and other cities also containing high immigrant populations, public education was being viewed as vital public policy. Such thinking stemmed from reformers like Horace Mann and Catharine Beecher, who believed that schooling was both practical and idealistic. It would prepare U.S. citizens for an increasingly industrialized society and would decrease such potential social problems as, according to one reformer, "intemperance, avarice, war, slavery, [and] bigotry." By raising literacy and mathematical skills, American education would provide a surer social footing to immigrants and reduce their need to return to the country they once called home. After all, few countries—not France, Germany, Ireland, Italy, or Scotland—could match the 90-percent literacy rate among whites that the United States would enjoy in 1860.

## election of 1828

The election of 1828 is widely considered a watershed in the history of the American state, primarily because it brought ANDREW JACKSON to power, inaugurating a westward shift in the nation's center of political gravity and a dramatic increase in the power of the presidency. It is also significant for the emergence of the first true political party machine, created by MARTIN VAN BUREN to deliver the White House to Jackson.

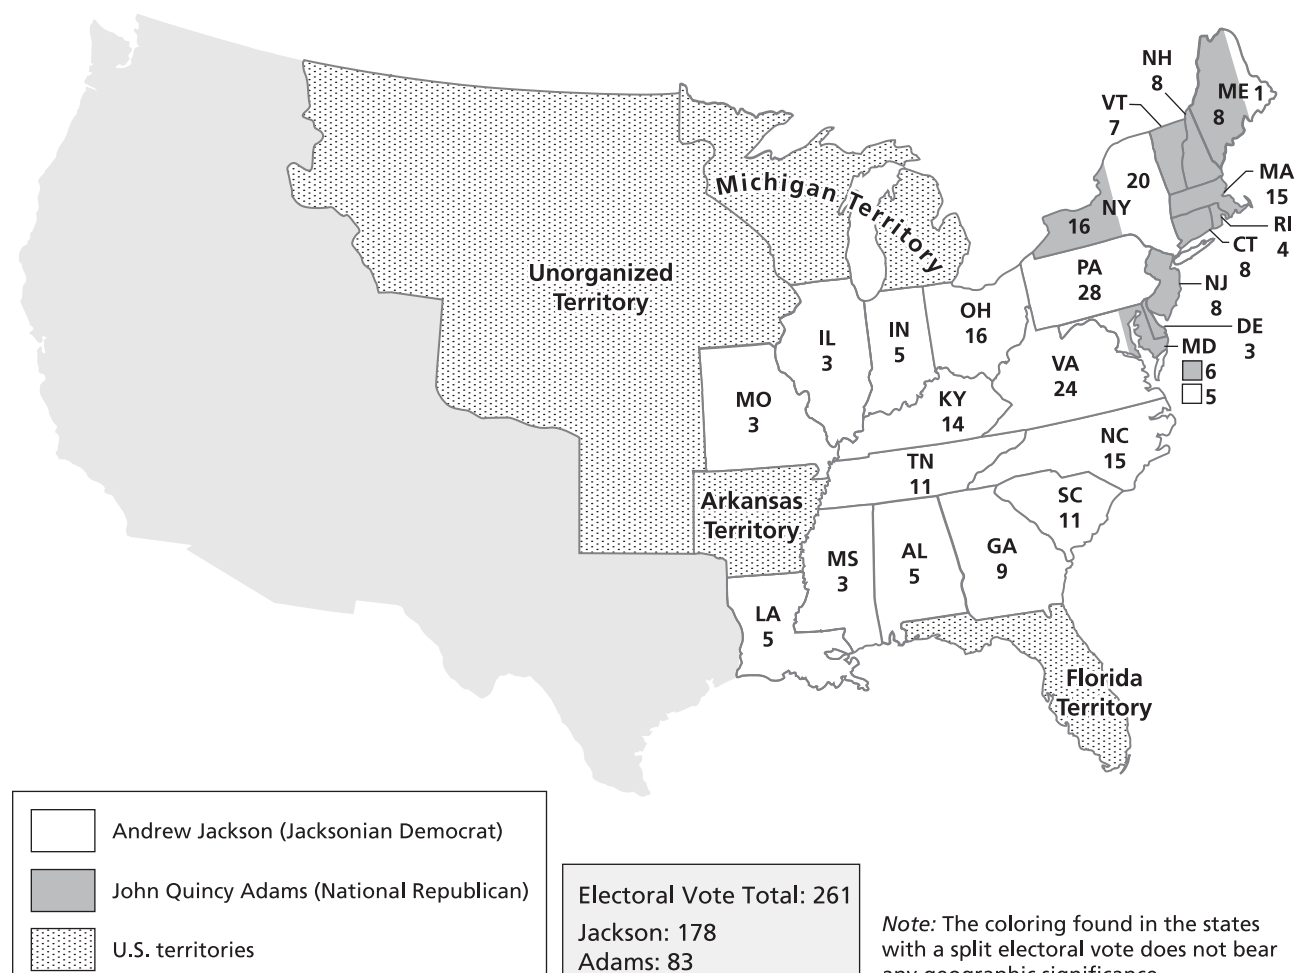

Both Van Buren's machine and Jackson's election were direct consequences of the disastrous electoral deadlock of 1824. That year, the Democratic-Republican Party (or DEMOCRATIC PARTY) of Thomas Jefferson and James Madison, which had been without rival since the disintegration of the Federalist Party during the WAR OF 1812, had fractured. Unable to agree on a successor to the almost universally beloved JAMES MONROE, party leaders had broken into regional factions, with southern agrarian interests generally favoring Secretary of the Treasury William H. Crawford, northern traders and manufacturers halfheartedly backing Secretary of State JOHN QUINCY ADAMS, and Speaker of the House HENRY CLAY seeking to represent the settlers of the newer western territories. Unfortunately for Clay, the West chose a different champion: Andrew Jackson. Elected a U.S. senator of Tennessee, Jackson had skillfully positioned himself as the champion of the poor and the scourge of wealth and privilege, to the horror of his initial patrons.

Jackson won a plurality of both the popular and the electoral vote, but fell well short of the absolute electoral majority necessary. For the second time in the life of the young republic, the election was thrown into the House of Representatives. Jackson's partisans argued that his twin pluralities were a mandate to the House for his election; Henry Clay, having been eliminated by virtue of his fourth-place finish, disagreed and lobbied his colleagues assiduously for the election of Adams, who eventually emerged victorious in the House by a single vote. When Adams then appointed Clay secretary of state, a position he had long sought, furious Jacksonians denounced it as evidence of a "corrupt bargain" which had blocked the ascension of the "legitimate" victor, Jackson.

Whether an explicit deal had in fact been made and whether leading Jacksonians believed it had remain subjects of historical debate. What is clear is that the "bargain" led to an irreparable breach within the Democratic-Republican Party, with the supporters of the victorious Adams styling themselves as the National Republican Party (1825–1833) and the adherents of Jackson retaining the older name.

The Jacksonian movement is often seen as the product of a western clique. In truth, however, no man did more than New Yorker Martin Van Buren to ensure Jackson's ascent. It was Van Buren who led the four-year siege that

## U.S. Presidential Elections: Electoral Vote, 1828

was the John Quincy Adams administration. Van Buren fashioned a disciplined, nationwide network that relentlessly promoted the central myth of the Jacksonian cause: that Old Hickory, the simple honest man of the frontier, was chosen by the people but swindled of his and their destiny by the corrupt aristocracy of the wealthy and well connected. Van Buren oversaw the systematic placement of pro-Jackson editors atop newspapers across the country, most notably Duff Green, who as editor of the Washington-based *Telegraph* tirelessly questioned Adams's honesty and patriotism.

In this campaign of character assassination, the Jacksonians were ably assisted by Adams himself. Urbane, educated, and cosmopolitan, Adams was likely the finest mind on the North American continent. Unfortunately,

his stubborn high-mindedness, aloof manner, and contentious nature were off-putting to many, who viewed him as snobbish and egotistical. His father's role as founder of the Federalist Party and an alleged monarchist likewise did not promote the image of Adams as "a man of the people." Even more serious, in his patrician disdain for factionalism of all kinds, Adams refused to reward friends and punish enemies. Seeking always to assemble the ablest men in the public's service, he did not discharge even those who openly joined his opposition or called for his defeat.

Adams's ambitious vision of strong federal leadership also hindered his cause. His calls for federal control of public lands to ensure more rational settlement and for federal protection of Native American lands to uphold

treaty rights were anathema to Jackson's supporters in the West. His various proposals for a national university, an education system, scientific and artistic institutions, comprehensive public works, and infrastructure programs all generated fear among the southern elites, who increasingly viewed strong states' rights as a necessity in the maintenance of slavery. His support for the BANK OF THE UNITED STATES alienated a broad array of its debtors and competitors. Most damaging was his support for a strong tariff to aid the development of American manufacturing and development. The southern planters, who faced stiff retaliation on their agricultural exports by the European nations, denounced the 1828 tariff as the "Tariff of Abominations."

Led by Van Buren, the Jacksonians promoted their hero as everything they said Adams was not: self-made, gruff, plainspoken, passionate, agrarian, democratic, manly, anti-intellectual, a strict states'-rights constructionist, and, most of all, opposed to economic privilege. Jackson's image of inarticulate morality proved quite useful in his party's strategy. To be as many things to as many men as possible, Jackson avoided detailing his views on the complicated economic and legal issues of the day, instead campaigning on his personal biography and charisma.

Running on values and biography had its risks, however. Adams and his supporters did not appreciate being called "corrupt," "aristocratic," and "undemocratic," or being constantly portrayed as closet monarchists and stooges of the rich. They fought back hard, labeling Jackson as "vicious," "barbaric," and "bloodthirsty." They accused him of conducting atrocities against Indians and army deserters, and they described him as having ungovernable passions manifested by fits of fury and "intemperate behavior." (This last charge had the virtue of being true.) Most disgraceful of all were the aspersions spread by the Adams forces on the character of Jackson's wife, Rachel, for the unknowing bigamy of her first years of marriage to Jackson; so distressing were the slanders that Rachel died of a heart attack shortly after the election. In return, Jackson's followers accused Adams of misappropriating federal funds, spending public monies lavishly on extreme personal luxury, and of acting as a pimp.

The Jacksonians also made attractive campaign promises, perhaps the most significant of which was "rotation in office," more commonly known as the spoils system. Arguing the democratically flattering view that any decent man of basic education could perform most of the jobs in government, the Jacksonians promised to sweep out the hated appointees of Adams and, incidentally, replace them with Jackson loyalists. As Jackson adherent William Macy famously said, "To the victor belong the spoils!" How, in fact, this was different from the arrangement Adams allegedly made with Clay was tactfully left unexplained.

In the end, Jackson defeated Adams by a healthy margin, 56 percent to 44 percent in the popular vote and 178 to 83 in the electoral count. Van Buren went so far as to resign from the Senate and run for governor of New York to ensure that its electors would be in Jackson's camp.

Despite the outrageous mudslinging and the debates about the tariff, the rights of the states, and the power of the Bank of the United States, in the end there was really only one issue in 1828: the election of 1824. Jackson had not won in 1824, but in the scramble to build an enduring majority that followed, his party had built both a myth and a machine that would carry the day in 1828, and in five of the seven presidential elections thereafter.

## election of 1840

The election of 1840 saw two milestones in American history. The victory of the WHIG PARTY opposition marked the end of the ad-hoc factionalism that had characterized the earlier era and firmly established the two-party system of American politics. At the same time, the innovative Whig campaign pioneered the modes and patterns of voter persuasion that have dominated campaigns ever since.

The nation approached the 1840 election preoccupied by four great issues: the extent of states' rights, the power of the executive, the structure of the financial system, and the expansion of the union. The contours of federalism continued to divide the nation into sections. On one hand, the NULLIFICATION CONTROVERSY of seven years earlier remained an open wound, estranging hard-line states' rights advocates like JOHN C. CALHOUN from the dominant DEMOCRATIC PARTY. On the other hand, nationalists such as HENRY CLAY and DANIEL WEBSTER had never reconciled themselves to the Democrats' states'-rights stance and became the organizing force of the new Whig coalition.

An individual's preference as to the relative power of the federal government and the states was not necessarily an indicator of his views on the balance of power between Congress and the presidency, however. Clay and Webster, for instance, both supported a strong central government but a weak executive within it; Calhoun opposed measures that strengthened either the national government or its president; while ANDREW JACKSON and MARTIN VAN BUREN supported states' rights and a powerful executive.

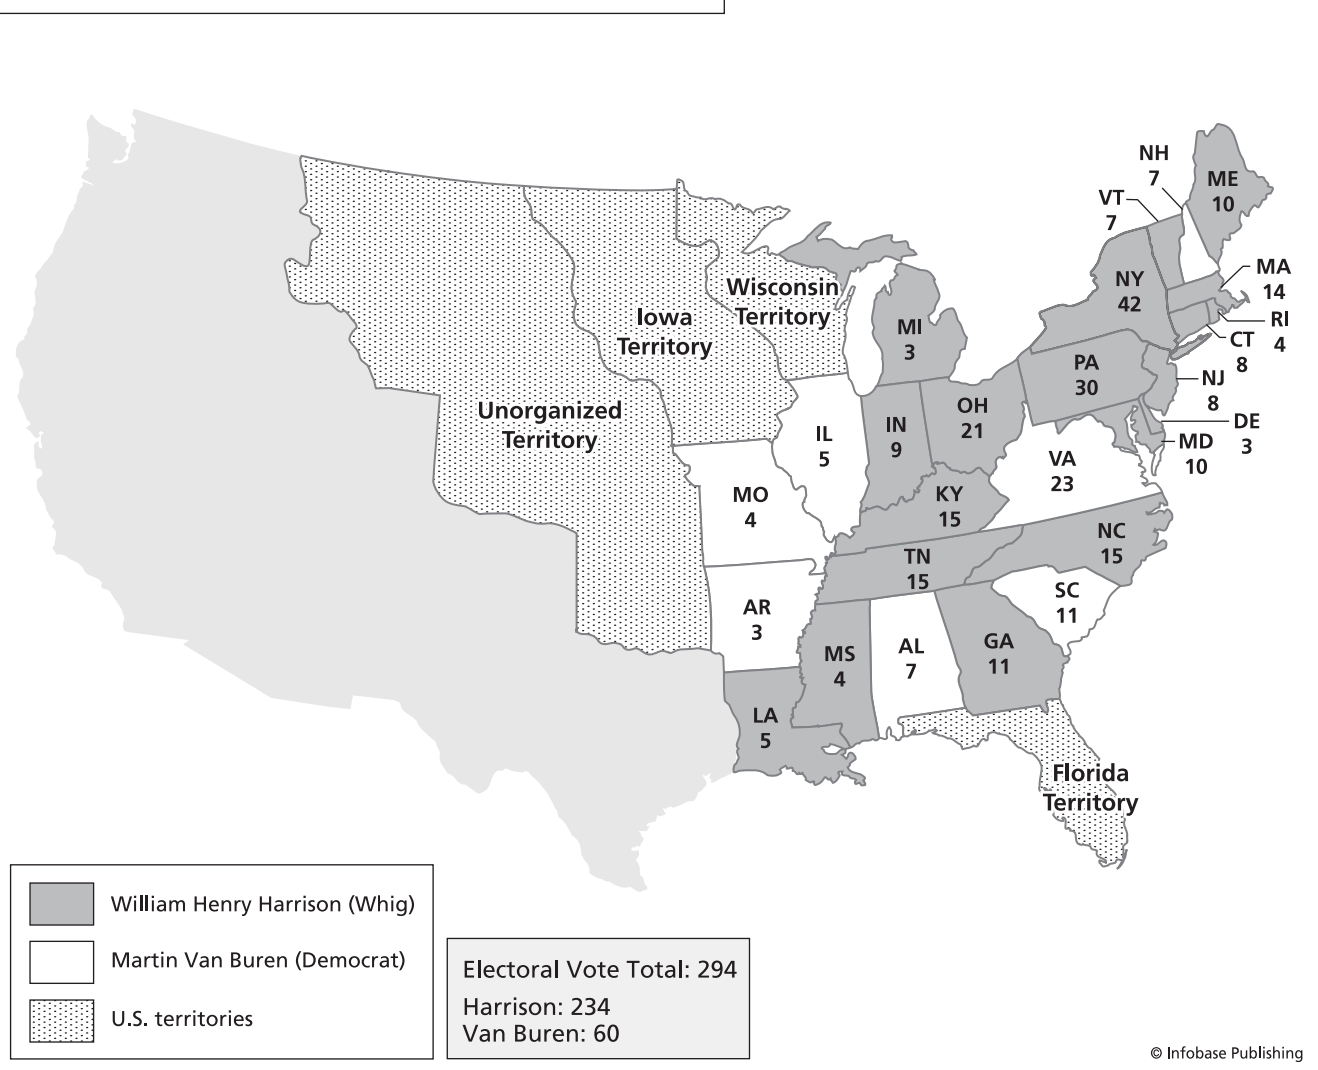

Disagreements over the proper model of federalism were enmeshed in the economic interests of the various factions and sections. These issues had come to a head in the struggle over the **SECOND BANK OF THE UNITED STATES**. After his reelection in 1832, President Jackson had refused to recharter the Bank of the United States, whose policies favored his political opponents. The efforts of bank president Nicholas Biddle to compel charter renewal by constricting the nation's credit supply had led to an alarming deflation. An unregulated increase in the issuing of state banknotes following the bank's closure in 1836 further aggravated the situation, leading to the **PANIC OF 1837** and crashing the national economy just weeks after Van Buren's inauguration. President Van Buren correctly diagnosed the underlying cause of the nation's economic ills to be overspeculation and, true to his party's stated principles, called for an independent

treasury to remove the federal government from the banking system altogether. Further hewing to laissez-faire economics, Van Buren declined to provide general relief to failing businesses. This stand provoked sustained public criticism from the Whigs, who insisted that the federal government was responsible for safeguarding the economic well-being of its citizens when prosperity failed; this novel view became an enduring theme of American politics.

Adding to the nation's sense of frustration were a long and inconclusive war with the Seminole nation of Florida and southern Georgia and Van Buren's deliberate foot-dragging on the annexation of Texas. The recent Texas revolution, led by close Jackson ally and Democrat Sam Houston, had successfully defeated the Mexican army, and sentiment in favor of the "inevitable" admission of Texas to the union was strong in the South and West. Van Buren

### U.S. Presidential Elections: Electoral Vote, 1840

was cautious, however. Mexico still claimed sovereignty and threatened war, and the admission of another slave state could upset the delicate balance on the smoldering issue of SLAVERY.

It was against this background of economic depression and expansionist frustration that the new Whig Party made its most important decision: to unite behind a single candidate. In 1836, the loose anti-Jacksonian coalition had nominated several sectional candidates for the presidency in an attempt to deadlock the electoral college and throw the selection of a president into the House of Representatives; that plan had proved disastrous in the face of the truly national party the Democrats had become. The Whig Party's single-candidate decision in 1840 sealed the future of American politics as a continuing clash between two broad, ideologically vague coalitions.

The Whigs would prove no less trailblazing in their decision as to who that single man would be. Henry Clay, the primary architect of the new coalition, wanted the job and was the expected choice. But the other leaders of the new party had learned much observing the hated Jackson and Van Buren. In 1840, they resolved to out-Jackson the Democrats in their choice of candidate and out-Van Buren them in their electioneering antics. Rather than initiating the "great debate" always sought by Clay, Webster, and Calhoun, the Whigs ran a cheerfully irrelevant campaign of images, slogans, and symbolism.

The nominee chosen for this new project was William Henry Harrison, who had run as one of the sectional candidates four years before. Tall and lean—like Jackson—Harrison was a former general and Indian fighter from the West—like Jackson. In truth, that was where the similarities ended. While Jackson had risen from humble beginnings on merit and compiled a glittering war record, Harrison was the scion of a wealthy old Virginia family who owed his military appointments and political career to social connections. His education was elite but undistinguished and his military record respectable but unimpressive in achievement.

By the time the Whig "Log Cabin and Cider" campaign was finished, all such distinctions between the hardscrabble Jackson and the aristocratic Harrison had been erased. Deliberately echoing Jackson's nickname of "Old Hickory," Harrison was christened "Old Tippecanoe" after his most notable military action, a minor Indian skirmish recast as a great and heroic American victory. In a campaign that marked the emergence of banners, placards, buttons, bunting, and grandiloquent nonsense as the trappings of American politics, the reserved Harrison was misrepresented to the public as a cider-drinking, two-fisted frontiersman who lived in a log cabin.

The Democrats rallied behind Van Buren—who was known variously as "The Little Magician," "The

Red Fox of Kinderhook" and, in a bow to Jackson, "Old Kinderhook"—and fought back. Supporters organized themselves into "O.K. Clubs" (for "Old Kinderhook"), a phenomenon that introduced the idiom "OK" into the American vernacular. Van Buren's partisans attacked Harrison's alleged lack of intellectual ability, citing no less an authority than Harrison campaign manager Henry Clay, who had referred to his party's standard-bearer as a "bumpkin." But their assaults proved no more effective than their opponents' similar charges had against Jackson. Indeed, Whig leaders managed to reprise many of the anti-intellectual and class aspersions Democrats had cast on JOHN QUINCY ADAMS.

The result was another innovation that would become commonplace in American politics: an inversion in which Martin Van Buren, the self-made tavern keeper's son and dogged battler of entrenched privilege, was portrayed as an elitist, while William Henry Harrison, the aristocratic mediocrity, was presented as the common man's soul mate.

It is impossible in retrospect to determine which was more decisive in the race's result—Harrison's dynamic persona or the continuing economic malaise. What is clear is that the Whig refrain of "Tippecanoe and Tyler too" (referring also to vice presidential candidate JOHN TYLER) carried the day. Harrison swamped Van Buren in the electoral college 234 to 60, though the popular vote was much closer at 53 percent to 47 percent.

Harrison, trying to live up to his freshly minted myth, went coatless on inauguration day and died of pneumonia a month later. The Whigs would survive only until 1858. But in their landmark campaign of 1840, they firmly imprinted both the underlying structure and the surface decoration on the American party system.

**Emerson, Ralph Waldo** (1803–1882) *scholar, writer* Philosopher, lecturer, poet, essayist, and the father of transcendentalism, Ralph Waldo Emerson was also a passionate abolitionist whose writings condemned both southern slaveholders and those northerners who were not fully committed to freedom for AFRICAN AMERICANS. Initially unenthusiastic about Abraham Lincoln, Emerson became a supporter during the Civil War and delivered a widely reprinted eulogy upon the death of the president.

Ralph Waldo Emerson (Library of Congress)

Born on May 25, 1803, Emerson was the son of a Unitarian pastor named William Emerson, who died in 1811, and Ruth Haskins Emerson. He was educated at the Boston Latin School, then at the Harvard Divinity School, and in 1829 he was ordained. After obtaining a position as second pastor at the Second Church of Boston, he married Ellen Tucker, who died only 18 months later. Because of his doubts about Unitarian doctrine, Emerson left the church and traveled to Europe, seeking knowledge and exposure to a wider range of thought.

In Britain, Emerson met Thomas Carlyle and other thinkers, whose ideas prompted a reexamination of his spirituality when he returned to Massachusetts in 1833. That same year, Emerson married for a second time, to Lydia Jackson. He began to lecture widely on spiritual issues, developing a philosophy that is known today as transcendentalism. In 1836, he published *Nature*, his first book, which outlined transcendentalism broadly. In 1837, at Harvard, Emerson delivered an address entitled "The American Scholar," which called for America to establish its own intellectual traditions apart from Europe. From

1840 until 1844, he and Margaret Fuller edited a literary journal dedicated to the TRANSCENDENTAL MOVEMENT called *The Dial*. Emerson would publish essays and poems throughout his life, always emphasizing individuality and the importance of the self.

Emerson succeeded Margaret Fuller as editor of *The Dial*, and during its continuance, until April 1844, he published more than 40 of his own pieces, prose and verse, in its columns. The poems included such famous ones as "The Problem," "Woodnotes," "The Sphinx," and "Fate." While the periodical contained much delicate and valuable writing, it failed due to lack of financial support. As chief intellectual leader of the idealists, Emerson took a close interest in the semisocialistic experiment at BROOK FARM (1840–47), with which some of the cleverest New England men and women of that day were connected, but he did not join the community. Nathaniel Hawthorne, who was actually a member and lost money in the undertaking, has been criticized for having viewed it independently; but Emerson, outside, held a similar neutral attitude, and wrote an account of the affair, in which, touching it humorously at points, he called it "*a French Revolution in small, an Age of Reason in a patty pan.*"

In addition to its focus on individuality, transcendentalism also embraced change. Perhaps this reflected, in part, Emerson's conviction that the society in which he lived was flawed by SLAVERY. A committed abolitionist, Emerson traveled widely before the Civil War, arguing everywhere that slavery should be destroyed. Occasionally these beliefs spurred a violent reaction, as when he was mobbed in 1861. During the war, he wrote widely on the progress of the conflict and on its aims.

Early in the Civil War, Emerson's reaction to Abraham Lincoln was guarded. Lincoln's folksy manner and lack of interest in the trappings of refinement were distasteful to the philosopher. In addition, Emerson was disappointed by Lincoln's avowed preference for a war to save the Union rather than a war to abolish slavery. Over time, however, Emerson came to believe in Lincoln's leadership. The two men met in 1862, very close to the publication of Emerson's essay "American Civilization," which argued that northerners could not plead innocence with regard to slavery. Because northern citizens were not fully committed to abolition, he suggested, they bore a portion of the blame for slavery. In 1863, Emerson expressed his support of Lincoln's Emancipation Proclamation in a poem entitled "Boston Hymn." After the president's assassination, he spoke at a memorial in Concord, Massachusetts, calling Lincoln "the father of his country."

Although Emerson continued to write and speak for the rest of his life, his work after the Civil War was focused mainly on his philosophy of life rather than on politics. On April 27, 1882, he died of pneumonia.

### Era of Good Feelings

The Era of Good Feelings (or Feeling) is usually placed between the TREATY OF GHENT (1814) and the election of JOHN QUINCY ADAMS in 1824. It was marked by three characteristics: nationalism, prosperity, and party unity. Although the WAR OF 1812 (1812–15) ended in a stalemate, Americans came to believe that it was a great triumph. In part, this sense of pride stemmed from the war's last battle, the BATTLE OF NEW ORLEANS (January 8, 1815), which was a tremendous victory for American arms. In part, too, just the idea of having fought the greatest power on earth to a standstill represented a victory for the republic. With the war behind them, Americans could concentrate on their own continent, acquiring FLORIDA in 1819 and coveting much of the rest of the continent. Everything seemed possible, and this optimism spread to the ECONOMY as a wild economic boom swept the nation. Land speculation was rampant, fed by the expansion of banking within the states and in the creation of the SECOND BANK OF THE UNITED STATES. Cotton prices, too, increased dramatically leading to greater production. Good feelings even seemed to enter politics. The first party system, pitting Federalists against Democratic-Republicans, disintegrated in the wake of the HARTFORD CONVENTION. The Federalists had been losing ground since 1800, and their opposition to the war destroyed them as a national force. JAMES MONROE won the 1816 election, 183–34, in the electoral college; by 1820, single-party government led to a 231–1 electoral college margin—and the single vote was for a member of Monroe's own cabinet.

Although the pride in American nationhood continued, neither the booming economy nor the party unity could last. The PANIC OF 1819 led to a recession that continued into the 1820s. Democratic-Republican politicians soon divided into warring camps and gave birth to a second-party system. By the time John Quincy Adams was elected president in 1824, growing conflicts over SLAVERY and other issues had brought the Era of Good Feelings to an end.

### Erie Canal

The most important and successful building project of the CANAL ERA was the construction of the Erie Canal. With the rapid increase of settlement in New York State after the American Revolution, businessmen and politicians began to discuss the possibility of constructing a waterway to facilitate trade and transportation between Lake Erie and the Hudson River, thereby connecting the port of New York City with the developing Northwest. As early as 1792, the Western Inland Lock Navigation Company began to build dams, locks, and canals, but never managed to construct more than a few miles of waterway. In the 1800s, new proposals for a canal system began to appear. In 1807, Jesse Hawley wrote a series of essays arguing that an east-west route was indeed possible. He thought that the route of an “artificial river” had already been laid out by God and only needed to be finished by humans. The following year, the New York legislature passed a bill authorizing surveyors to search for possible routes. In 1810, a canal commission was created to begin searching for ways to finance this project. The commission asked for federal funding, but President James Madison eventually vetoed their proposal in 1817. That same year, DeWitt Clinton, one of the canal project's main promoters, was elected governor of New York. He decided to proceed with the proposed canal plan using state funding. He persuaded the legislature to authorize construction of the Erie Canal as well as the Champlain Canal, which would connect Albany to Lake Champlain in the northeastern corner of the state. On July 4, 1817, with much fanfare, Clinton and his supporters broke the ground for the beginning of canal construction.

Construction of the canal began in the middle section, 98 miles of which were completed by 1819. By 1820, the western and middle portions of the canal were already in use. In 1823 the canal finally reached the Hudson. Two years later, the enormous project was complete from Buffalo to Albany. This unprecedented engineering accomplishment was celebrated across the region, as farmers, merchants, and artisans looked forward to an expanded market for their goods. The Erie Canal was an instant financial and public relations success; tolls paid for its construction costs in only a short time. Almost immediately, the legislature authorized the creation of 17 lateral canals that would connect even more towns to the new trade artery. The Canal Board, which would manage the new waterway, was established in 1826. Only 10 years later, the Erie Canal Enlargement project began, to ease the traffic congestion which was by then a common feature of canal travel. This major expansion was not completed until 1862. Because of the Erie Canal's stunning success, the demand for canal construction intensified throughout the United States. Unlike the Erie, most of the later canals were federally or privately funded, not state-funded.

An engraving depicting the first barges en route from Buffalo to New York City via the newly opened Erie Canal (Hulton/Archive)

But none of these projects proved as successful or culturally significant.

The original canal was four feet deep, 40 feet wide, and 363 miles long. It cost \$7 million to build and contained 83 locks and 18 aqueducts. Benjamin Wright and his associates (later referred to as the “Erie School” of engineers) oversaw the construction. In the process, Wright and his workers developed new machines to help remove roots and stumps and invented a new watertight mortar to line the canal bottom. They built aqueducts across valleys and rivers and locks to level out less-dramatic changes in elevation.

Canal-digging was backbreaking, dangerous work. Laborers were hired not by the state but by private contractors who placed bids for constructing certain sections of the canal. Many of the diggers were local farmers, hired by these contractors to work on the stretch of canal near their towns. Many other diggers were recent immigrants, mostly from Ireland. The presence of these immigrant wage-laborers concerned some of the canal’s proponents. Often uneducated and without a permanent home, these

men symbolized the kind of wage slavery that, according to popular ideology in the early republic, was not supposed to exist in the United States. The Erie Canal was supposed to embody the proposition that all men could become independent landowners, prospering through the democracy of property ownership and trade. The fact that this canal of progress was built by the seemingly un-American was unimportant. Once the canal was completed, some of these same workers became part of the huge workforce required to operate the canal and canal boats.

The new canal revolutionized travel and trade in the region as transporting goods became quicker and cheaper. Farmers who previously had no accessible market for their produce were now able make the transition from subsistence farming to commercial AGRICULTURE. Land near the canal rose in value, and new cities grew up seemingly overnight, ready to take advantage of the commerce the canal would create. The ease with which goods could be transported to New York City gave it an economic advantage over other American coastal cities. Always an important port, New York became *the* center of American and trans-

Atlantic commerce—a preeminent position that would endure for more than a century.

The canal also promoted travel and tourism in the region. Sightseers reveled in the wild scenery and bustling towns. While canal travel could sometimes be uncomfortable, most people found it exciting at first. New kinds of travel boats were created, providing meals, foldout sleeping cots, and entertainment. Previously isolated from the outside world, families were able to visit commercial centers and keep in touch with relatives through the rapid transit of canal boats (and the increasingly speedy mail service). For the first time, big-city luxury goods could be easily shipped to the developing West, rapidly transforming the quality of life in the hinterland. Journeys that used to take weeks could now be completed in a few days.

But with the canal's triumphs came troubles. The canal cut across private property, and many landowners complained that they were never adequately reimbursed for losing their property. Farmers whose land had been bisected by the canal lobbied the Canal Board for the right to construct bridges over the canal. Without bridges, some landowners were unable to travel to the towns to sell their goods without trespassing on neighbors' property. In turn, shipping companies lobbied against these bridges, which created increased navigation obstacles and safety hazards.

The culture that developed among canal workers was troubling to merchants and civic leaders. These workers were mostly unmarried, often recent immigrants, and sometimes young boys. The mobile nature of boat life seemed to promote vice; saloons multiplied in port towns, and prostitutes became a visible presence along the route. The canal operated 24 hours a day, seven days a week, creating noisy nightlife and increased crime. In the 1830s, the Canal area became known as the "burned-over district" because of an explosion of evangelical fervor and reform campaigns. The reformers were especially concerned about the behavior of the canal workers and tried to force the Canal Board to close operations on Sundays, so that drivers and longshoremen could attend church. Others argued that, given idle time, vice among the workers would increase. Another serious problem was what to do with the canal workers during the winter months, when canal operations completely shut down. Port towns were forced to deal with groups of unemployed or marginally employed men for months at a time.

Of course, not all canal workers were dangerous and immoral; many boating operations were run by families, and not all single men were a threat to civilized life. However, troublemakers loomed large in the imaginations of local farmers, worried again that their vision of ordered, moral progress was being undermined by the seemingly alien values of canal culture.

The Erie Canal became too successful for its own good as swarms of boats crowded in, slowing down what was sup-

posed to be the most rapid form of transit. The increased congestion and numerous locks in the eastern part of the canal proved so tedious that many shipping companies were forced to circumvent these sections in order to save time, transporting their goods by road during these sections of the journey.

Many observers worried that the progress created by the canal was made at too high a cost, morally and economically. The "canal mania" that accompanied its completion caused wild speculation among bankers and merchants that often resulted in ruin. Fortunes could be made and lost very quickly in this new environment, causing many to question whether the canal really was a financial boon. The structure that was supposed to stabilize and improve their lives was proving to be a volatile force beyond their control. Small farmers began to suspect that, while the state had originally built the canal to benefit everyone, the parties who ended up gaining the most were big corporations. More and more people in the canal region felt that the state government was more interested in protecting powerful companies than ordinary voters.

The Erie Canal permanently altered the landscape and economy of New York. It was one of the first INTERNAL IMPROVEMENTS designed to expand American mobility and trade during the early 19th century. Although it continued to prosper for many years, it was eventually eclipsed by railroads, which were much faster and could operate year round. The canal survived well into the 20th century as an important auxiliary method for transporting freight. It remains an important exemplar of American ambition, engineering, and resourcefulness. For historians, the Erie Canal provides a revealing case study about the complexities of labor, property, and ideas about progress in American culture.

## Essex, USS

The USS *Essex*, a 46-gun frigate, is most famous for its voyage to the Pacific in the WAR OF 1812 (1812–15), wreaking havoc on British shipping until it was captured by the frigate HMS *Phoebe* and another vessel. The *Essex* was built in Salem, Massachusetts, as part of the expansion of the

U.S. Navy in the late 1790s. In 1799, along with the USS *Congress*, the *Essex* under Edward Preble was dispatched to the Far East to escort an American convoy of merchantmen back to the United States. The *Congress* was damaged in a storm soon after it left port, leaving the *Essex* to proceed on its own. The *Essex* was thus the first American naval vessel to cross the equator, venture into the Indian Ocean, and show its flag in the East Indies. She returned after almost a year at sea in 1800.

The *Essex* also participated in the campaign against Tripoli (1803–05), but only really became famous at the beginning of the War of 1812. In July 1812, the *Essex* under the command of Captain David Porter missed a British convoy in the Atlantic, but in two months she captured nine prizes, including the first British warship to surrender to an American vessel in the war. The total value of the prizes was over \$300,000, an impressive sum at the time. In autumn 1812, the *Essex* was ordered to rendezvous with the *Constitution* and the *Hornet* in the South Atlantic. Those two ships, however, successfully fought with British counterparts and returned to the United States. Left on his own, and fearing that he was surrounded by British warships, Captain Porter headed for the Pacific. By early spring 1813, he was capturing British whalers and other vessels, accumulating a small fleet for himself. In September, he decided he needed to refit and set sail for the Marquesas. After spending seven weeks in the Pacific island paradise of Nukahiva, Porter left the island group with the *Essex* and a consort he had captured earlier and called the *Essex Junior*. Unfortunately, soon after they arrived in Valparaíso, Chile, then still a Spanish possession, two British ships appeared. Since they were in a neutral port, the British did not attack, but when Porter finally made an attempt to run past them, a gale came up and damaged some of the rigging of the *Essex*. Although Porter made it back to neutral waters, the two British ships pursued him and pounded him into surrender while remaining out of range of most of the *Essex*'s heavy guns.

## exploration

The U.S. purchase of the Louisiana Territory in 1803 opened up a vast area for American exploration, more than 800,000 square miles from the Mississippi River to the Rocky Mountains. After Meriwether Lewis and William Clark reconnoitered that region and, further west, the Oregon Territory, in their expedition of 1804–06, other explorers soon followed. In 1806–07, soldier ZEBULON PIKE ventured into what is now Colorado, where he

sighted Pike's Peak, and into New Mexico, then held by Spain. John Colter and George Drouillard, veterans of the Lewis and Clark Expedition, explored what are now Montana and Wyoming in 1807. As the United States stretched its territory from coast to coast in the remaining antebellum years, many more explorers sent back reports about these and other little-known lands.

Not all expeditions were government-sponsored. Much exploration in the period 1813–55 was done by adventurous private citizens motivated by profit and working for themselves or on behalf of companies. They ventured not only into Louisiana but into the Spanish-owned, and later Mexican-owned, areas of CALIFORNIA and the present-day Southwest, as well as into the disputed Oregon Territory.

Among the most notable private explorers were MOUNTAIN MEN, professional fur trappers and traders such as JEDEDIAH STRONG SMITH, JAMES BRIDGER, Joseph Walker, and JIM BECKWORTH. These men lived a rugged existence in the Rocky Mountain wilderness, trapping beavers and other animals. They learned survival techniques and cultural practices from the region's NATIVE AMERICANS and often married Indian women. The explorations of these frontiersmen were vital to charting the territories that became part of the United States.

The heyday of the mountain men began in the 1820s, when fur traders WILLIAM HENRY ASHLEY and Andrew Henry developed the brigade-RENDEZVOUS system for financing and supplying them. Brigades, or teams of trappers, lived and worked in the wilderness, supplied by pack or wagon trains from Missouri that would meet them every summer at a boisterous trading event called a rendezvous. A similar system developed in the Southwest, where the mountain men spent summers trading and carousing at town fairs, such as at Taos, New Mexico. The era of the mountain man faded in the 1840s, when overtrapping sent the beaver population into decline and changing tastes made beaver hats unfashionable. Mountain men also often served as scouts or guides for other people's expeditions, both before and after the decline of the FUR TRADE.

Probably the most renowned mountain man was Jedediah Strong Smith, who blazed several trails from 1822 until his death in 1831. In 1824 or 1825, he discovered an overland route to California through SOUTH PASS, which later became part of a well-traversed westward route known as the Overland Trail. (He actually rediscovered South Pass; it had first been discovered in 1812 by Robert Stuart of ASTORIA.) In 1826–27, Smith led his greatest expedition, becoming the first American to go overland to California through the Southwest. His route took him to the Great Salt Lake and across the Colorado Plateau, Mojave Desert, and Sierra Nevada to San Gabriel, California. On the return trip, he traveled northward through the San Joaquin Valley and through Ebbetts Pass across the Great Basin, where his

party of three almost perished from thirst. They became the first non-Indians to cross the Sierras from the east and the first to traverse the Great Basin. Smith also explored the Black Hills of what is now South Dakota, survived a grizzly bear attack, and waged numerous battles with Native Americans. He was finally killed by the Comanche.

James Bridger worked with northeastern fur companies from 1822 to 1842. In 1824, Bridger became the first non-Indian to see the Great Salt Lake. He founded Fort Bridger, Wyoming, in 1843 and discovered Bridger's Pass in 1849. Joseph Reddeford Walker trapped and traded in the upper Missouri region from 1820 to 1840. His name was bequeathed to Walker Lake and Walker's Pass. He was a guide for several exploratory expeditions between 1832 and 1860.

James Pierson Beckwourth, an African American, had been born a slave but was raised free in Missouri. He took part in the Ashley-Henry fur-trading expeditions into the Rocky Mountains (1823–26) and lived with the Crow from 1826 to 1837. From 1837 to 1850, he was variously a guide, army scout, trapper, trader, and hunter. In 1850, he discovered the Beckwourth Pass in the Sierra Nevada, which opened a route to the Sacramento Valley of California.

Other mountain men included James Ohio Pattie and his father, Sylvester Pattie, who together in 1827 traveled from Santa Fe, New Mexico, to Southern California; and Ewing Young and William Wolfskill, who helped to blaze the Old Spanish Trail from Santa Fe to Los Angeles. KIT CARSON was a saddlemaker's apprentice who ran away to join an expedition to Santa Fe in the 1820s. He became a mountain man and served as guide for JOHN C. FRÉMONT's three government-sponsored expeditions.

Those who traded with mountain men also did their part in exploring the West. The SANTA FE TRAIL was established in 1821 by American merchant WILLIAM BECKNELL, who drew on knowledge of trails first used by Native Americans. The Santa Fe Trail ran about 780 miles from western Missouri to Santa Fe. Every summer from the 1820s to the 1840s, Becknell and other merchants brought wagon caravans laden with goods to trade with Mexicans, Indians, mountain men, and anyone else in New Mexico.

The 1820s constitutes a low point as far as government-sponsored expeditions are concerned, but in 1820 Major Stephen Harriman Long of the Corps of Topographical Engineers was entrusted to explore the region from the Platte River to the Front Range of the Rocky Mountains and from there down the Canadian River. His endeavors charted a great deal of what became known as the MORMON and OREGON TRAILS two decades later, and his *Account of an Expedition from Pittsburgh to the Rocky Mountains* was also well-received. In it Long presented one of the first descriptions of the Central Plains or, as he termed it, the Great American Desert, which he erroneously asserted was

unsuitable for agrarian expansion. Long's explorations were unique in that he was accompanied by noted artists Samuel Seymour and Titian Ramsay Peale, whose quaint imagery provided the American public with their first glimpses of the Rocky Mountain area. They also accurately rendered exotic plants, animals, landscapes, and scenes taken from Native American life.

After Long's initial charts, the Oregon Trail developed from Native American trails, the explorations of Lewis and Clark, and the pioneering of mountain men such as Nathaniel Jarvis Wyeth, who founded Fort Hall, Idaho, in 1834. Stretching 2,000 miles from Independence, Missouri, to Oregon's Willamette Valley, the Oregon Trail passed through what are now Kansas, Nebraska, Wyoming, and Idaho. It was heavily used by westward-moving pioneers in the 1840s and 1850s.

As the era of the mountain men faded, government-sponsored expeditions became more important. In 1838, the Corps of Topographical Engineers was founded as a distinct army unit to explore, survey, and report on little-known lands. Their greatest officer was John C. Frémont, known as the Pathfinder, who in the 1840s surveyed areas along routes into Oregon and California. In 1841, he traced the headwaters of the Des Moines River. In 1842, guided by Kit Carson, he explored Rocky Mountain territory along the Oregon Trail. In 1843–44, Frémont and Carson explored the Nevada country, crossed the Sierra Nevada to California, visited Oregon, and returned home by a more southerly route. Frémont's reports roused interest back east about the western territories, especially California. In 1845–46 Frémont and Carson surveyed the central Rockies and the Great Salt Lake region.

The son-in-law of Senator THOMAS HART BENTON, Frémont was much admired back home, but he sometimes went too far, playing a central role, for instance, in the controversial BEAR FLAG REVOLT in 1846. He helped to capture California for the United States during the MEXICAN-AMERICAN WAR (1846–48), but was court-martialed for mutiny and insubordination when he fell out with a superior. His sentence was remitted, but he resigned from the army. In 1856, he became the Republican Party's first presidential candidate.

The 1840s brought many more Americans to the West, pioneers who aided in exploring and mapping territory even though they followed trails blazed by others. In 1846–47, in what was known as the Mormon trek, BRIGHAM YOUNG led a group of Mormons fleeing persecution from Illinois to Nebraska to the Great Salt Lake Valley in what is now Utah. They covered 1,300 miles, some of it over old Native-American trails and parts of the Ox-Bow, Oregon, and California trails. In the CALIFORNIA GOLD RUSH of 1849, the discovery of gold in California brought would-be prospectors into regions that had previously been

little known. Missionaries, some of them foreign-born, also advanced the cause of exploration. Belgian-born Jesuit missionary Pierre-Jean De Smet founded a chain of missions in the Pacific Northwest that ministered to Native Americans and added to knowledge of the region.

Once the TREATY OF GUADALUPE HIDALGO (1848) at the end of the Mexican-American War brought California and the Southwest into American possession, the era of exploration was gradually replaced by one of scientific mapping and pioneer settlement. By that time, Oregon had become a settled issue. Spain and Russia had abandoned their claims to the Oregon territory in, respectively, 1819 and 1824, leaving the United States and Britain to argue over it. In 1846, the OREGON TREATY set the border between U.S.-owned Oregon and Canada at the 49th parallel from the Rocky Mountains to the Pacific Ocean. Further south, the GADSDEN PURCHASE (1853) expanded U.S. territory in the Southwest to its present boundaries. The Transcontinental Railroad Surveys of 1853–55, conducted by the U.S. Army in search of a railroad route to the Pacific, added more knowledge of the West. These expeditions were conducted by Lieutenant Colonel Gouverneur Kemble Warren, a West Point graduate who went on to a distinguished military career in the Civil War. Warren covered and mapped the river systems of present-day Nebraska, Wyoming, South Dakota, and North Dakota. While not an object of settlement at the time, these regions were destined to draw white settlers within a decade. Warren's expedition never met with the celebrity of Frémont's, but with his topographical expertise he accurately recorded, for the first time, the Platte, White, Missouri, Yellowstone, Cheyenne, and Niobara Rivers, benefiting military and civilians alike. By the end of the 1850s, the major features of the continent were well known, though more detailed mapping would be done after the Civil War.

With so much territory at home to explore, Americans had little time for more far-flung expeditions. Nevertheless, some intrepid Americans pushed beyond their country's shores. On a whaling voyage in 1820, American sea captain Nathaniel Brown Palmer reached the Antarctic Peninsula and the South Orkney Islands. In 1839, American traveler and author John Lloyd Stephens and English artist Frederick Catherwood conducted explorations in Central

America, discovering Mayan ruins in Copán and elsewhere. In 1838–42, naval officer Charles Wilkes led the Wilkes expedition to Antarctica, Hawaii, the Pacific islands, and the Oregon coast. Wilkes arrived off the Oregon coast in the spring of 1841 and dispatched boat expeditions up the COLUMBIA RIVER to the mouth of the Snake River while other teams paddled southward down the Willamette River. He subsequently explored the Olympic Peninsula and the Straits of Juan de Fuca, and in his official report he suggested that authorities draw the border with Canada at the top of Puget Sound. This contributed to the assertiveness of President JAMES K. POLK (1845–49), who claimed the Pacific Northwest for the United States and forced Great Britain to make concessions. Besides exploring, Wilkes edited and published his highly detailed five-volume work, *Narrative of the United States Exploring Expedition*, which helped raise public awareness of the trans-Mississippi West and the Pacific region. It also established a precedent of scientific excellence in terms of observation and cataloging that would characterize American government exploration until the end of the century. In fact, many of the detailed maps and charts created during the Wilkes expedition were still in use by the U.S. Navy throughout World War II. Wilkes is credited with naming Antarctica and discovering that it is a continent.

### female antislavery societies

For as long as SLAVERY flourished in the United States, opposition to its existence was its dogged partner. Whether by individuals or by groups such as the Quakers, antislavery sentiment predated the Revolutionary War and continued through the early years of the new republic. As early as 1820 Benjamin Lundy's colonization newspaper *The Genius of Universal Emancipation* featured articles written by Elizabeth Chandler, a Quaker, in a column entitled "Ladies Repository." It was not until the 1830s, however, that abolitionist opinion found formal expression through the formation of antislavery societies across the United States. The first such society is commonly considered to be the AMERICAN ANTI-SLAVERY SOCIETY, founded by William Lloyd Garrison in 1832. That group excluded women from its proceedings, causing Boston's female abolitionists to create their own organization, the Boston Female Anti-Slavery Society, in the same year. Independently of these bodies, a group of free black women formed the Female Anti-Slavery Society in Salem, Massachusetts, also in 1832. This group, drawn from a diverse assemblage of Unitarians, Quakers, Congregationalists, and Baptists, took the process a step further by nominating Charlotte Phelps, wife of Reverend Amos Phelps, to serve as their president. Their high-profile fund-raising and petitioning occasioned much indignation in the press and even mob violence at their gatherings. One year later, after being refused entry to the meetings of the Philadelphia Anti-Slavery Society, LUCRETIA MOTT founded the Philadelphia Female Anti-Slavery Society. At its inception, the society had 19 members, including two Quaker sisters from South Carolina, ANGELINA GRIMKÉ AND SARAH GRIMKÉ. It was also unique for including African-American women among its members, drawn from that city's sizable free black population.

Female antislavery societies had much the same goal as their male counterparts: the end of the institution of slavery within the United States. Most abolitionists objected

to slavery on moral grounds, believing that it was expressly wrong for one human to hold another in bondage, and, using the rhetoric of the new republic, calling for equality, justice, and liberty for all. Abolitionists convened public meetings to explain their position and used the power of the printing press to try to educate the general citizenry in their beliefs. Garrison and other prominent abolitionists such as Frederick Douglass published antislavery newspapers, while numerous activists wrote pamphlets and tracts for distribution across the North and South. Despite prohibitions against direct organizational participation, Garrison was the first abolitionist leader to encourage women to get involved in the movement. He did so by invoking the widely held 19th-century idea that women were intrinsically superior to men in terms of morality and religiosity. His newspaper, *The Liberator*, featured a women's column with the masthead "Am I not a woman and a sister?"

Female antislavery activists were central to these endeavors. Male abolitionists were generally comfortable with the idea of women raising funds for the movement, particularly as this mirrored the gender roles found in many churches of the period. Women also became adept at writing and circulating petitions, flooding the federal government with requests for the abolition of slavery through the 1830s and 1840s. Women were welcome to participate, provided their involvement was restricted to the background and did not violate social taboos against activities such as public speaking. In time, however, these restrictions became the impetus for the creation of female antislavery societies, which by their very existence directly challenged traditional social behaviors for the perceived weaker sex.

Although women, like men, often wrote and spoke publicly about their antislavery beliefs, they were frequently perceived to be stepping outside the acceptable boundaries of a woman's "place" when they did so. To opponents of such female activism, it was especially disturbing that many female abolitionist writings appealed directly to other women, politicizing their roles as sisters, wives, and

mothers. Angelina Grimké's 1836 pamphlet *An Appeal to the Christian Women of the South*, for example, pressed southern women to use their familial ties to men to exert influence over the business of the legislature and the ballot box. Sarah Grimké published a theological critique of slavery that same year, implicitly stepping into a sphere—ministry—that was generally, although not exclusively, the domain of men. In 1837 they went on to conduct an extensive speaking tour of New England, which garnered them additional notoriety. When the sisters and other women, including Lucretia Mott, followed up their published works with lecture tours, outrage at their behavior reached fever pitch. Catharine Beecher publicly criticized the Grimkés for their “unfeminine” behavior, while the collective clergy of Massachusetts issued a pastoral letter condemning the sisters. But the precedent had been set. After 1837 the doors continued to open for a growing list of paid female lecturers and public speakers, despite the already sharp and increasing antipathy against them.

Regardless, female antislavery societies flourished in the North and by 1837 were of sufficient number to warrant the first National Female Anti-Slavery Society convention in New York. Eighty-one delegates from 12 states attended the convention, an event that was multiracial, as were the female antislavery societies themselves. Opposition to the political and abolitionist activism of women, however, continued, and after the second national convention was held in Philadelphia in 1838, the meeting hall in which it had taken place was burned to the ground. Such violence exerted little impact on female petitioning. Having been proscribed from the political arena, women continued to pursue this convenient and publicly visible outlet for expressing political views.

By 1840 the American Anti-Slavery Society had, amid bitter acrimony, conceded women's right to join its ranks. This, in turn, prompted dissenters to form their own women-free organizations. Thereafter the ABOLITION MOVEMENT lacked the unanimity it had enjoyed throughout the 1830s. Yet out of this bitter contretemps a new generation of female leaders and new levels of female participation emerged. It was as a delegate of the American Anti-Slavery Society that Lucretia Mott traveled to the World Anti-Slavery Convention in London in 1840. There she was refused admittance, male delegates arguing that the presence of women would trivialize the proceedings and undermine everything they hoped to achieve. Mott found a sympathetic supporter in Elizabeth Cady Stanton, the wife of another delegate to the convention. The two talked at length about the continued inequities experienced by women and resolved to hold a convention that expressly tackled the issue of women's rights. Helped by numerous other women's activists, that convention took place in SENECA FALLS, New York, in 1848. For the next

two decades the causes of abolition and women's rights became closely entwined, although the pairing was never completely harmonious.

Female antislavery societies were crucial to the success of the abolitionist movement and also acted as a catalyst to the formation of a women's rights movement later in the century. Using the tactics and political expertise they had gleaned from their abolitionist activism, women fought not only for the rights of the enslaved but for themselves. Their actions fueled the debate about gender equality for the rest of the century.

### **Figueroa, José** (1792–1835) *government official*

José Figueroa was the Mexican governor of California responsible for establishing a central government. Born in Jonacatepec, Morelos, Figueroa made his appearance on the national scene in 1821 at the time of the movement for the independence of Mexico, when he served as the personal secretary of General Vicente Guerrero. After Mexico became an independent nation, Figueroa assumed several military and political positions. In 1824, he was commanding general of Sinaloa and Sonora, where he actively suppressed Indian revolts. He was appointed governor (commandante general and *jefe político*) of Upper (Alta) California in 1833. Among his duties were presiding over the education of the recently secularized mission neophytes, dividing up the Indian lands, and fostering the colonization of skilled workingmen and artisans into the province. He also had instructions to keep an eye on trade with the Russians and the American whaling ships.

Figueroa became embroiled in domestic political squabbles when he set about administering the law of the Mexican Congress to secularize the California missions. At issue were some of the most attractive lands in the province. Figueroa acted to thwart the schemes of José María Padres and José María Híjar (the latter already appointed

as Figueroa's successor as governor) in their colonization plans for mission lands. When General ANTONIO LÓPEZ DE SANTA ANNA took office in 1834, he reappointed Figueroa to the office of governor of Alta California. Figueroa used the authority of his office to order the Padres-Hijar colonies off the mission lands and directed that they settle along the northern frontier of Sonoma, Solano, and Petaluma as a buffer against Russian expansion to the south. His quarrel with Padres and Hajar continued, and he eventually expelled them from California. He then wrote a political testament defending his actions, under the title *The Manifesto to the Mexican Republic*. Figueroa's last actions as governor were concerned with securing the northern border against Indian revolt and Russian penetration. In 1835, he died in Monterey and was buried in Santa Barbara.

Figueroa was an important figure in the establishment of the authority of the central government in California. During his administration, he worked on the issues that were important to the Republic of Mexico. These included the administration of the Secularization Law of 1833 and safeguarding mission lands, securing the northern frontier against penetration by the Russians, and monitoring the expansion of American companies into the trades in hides and tallow. Loyal to his superiors in Mexico City, he was a man who stood up against the corruption and cronyism associated with much of Mexican political life at the time.

**Fillmore, Millard** (1800–1874) *U.S. vice president, 13th U.S. president*

Millard Fillmore ascended to the presidency as the United States was descending into strife over the issue of slavery. As president, Fillmore tried to preserve the Union but was unable to change the nation's path to civil war. Millard Fillmore was born in New York City in 1800, the second-oldest child in a family of nine children. He spent his early years working on the family farm and attended school until the age of 17. Fillmore began to pursue a career in law at the age of 19, and in 1823 he opened a law office in East Aurora, New York. Three years later he married Abigail Powers, a teacher, and had two children, Mary Abigail and Millard Powers.

Millard Fillmore became involved in politics in 1826, and, with his handsome looks and professional manner, began to earn the respect and admiration of the local population. He caught the attention of the Anti-Masonic poli-

Millard Fillmore (Library of Congress)

ticians, who were looking for appealing candidates. As an associate of the Anti-Masonic politician Thurlow Weed, Fillmore held state office and for eight years was a member of the U.S. House of Representatives.

In Congress, Fillmore lent his support to HENRY CLAY, the leader of the WHIG PARTY. He was largely responsible for the Tariff of 1842 that raised rates as high as the Tariff of 1833, which caused the nullification crisis in South Carolina. Fillmore did not run for reelection in 1842. He hoped for the vice presidential nomination on Clay's Whig presidential ticket, but the party's national convention of 1844 gave that spot to Theodore Frelinghuysen of New Jersey. Fillmore then accepted the Whig nomination for governor of New York. In the election, however, Fillmore and Clay lost the New York vote, and Fillmore was beaten by Silas Wright, his DEMOCRATIC PARTY opponent.

Millard Fillmore was elected vice president of the United States as the running mate of ZACHARY TAYLOR in the election of 1848. In his first six months in office, debates raged in the Senate between northern and southern sectionalists over the status of SLAVERY in the recently acquired lands. Fillmore's fairness and sense of humor in the chair were not enough to restore peace among the contending senators. The antislavery faction, led by Senators Salmon P. Chase and William H. Seward, clashed with the southerners, led by Senators JOHN C. CALHOUN of South

Carolina and Jefferson Davis of Mississippi. Heated debates took place at all levels of government. President Taylor leaned more toward Seward's antislavery views, despite being a slaveholder from Louisiana. Taylor threatened to send federal troops to protect disputed New Mexico territory from an invasion by proslavery Texans. Southerners countered that this act would be the signal for an armed Southern rebellion against federal power. In June 1850 Mississippi called for a convention to meet at Nashville, Tennessee, to consider secession.

A bill to admit California caused heated debate for and against the extension of slavery, and no progress was made on the issue of slavery. Clay, exhausted, left Washington to recuperate, throwing leadership upon Senator Stephen A. Douglas of Illinois. On July 9 President Taylor died, elevating Fillmore to the presidency. President Fillmore announced in favor of the COMPROMISE OF 1850. On August 6, 1850, he sent a message to Congress recommending that TEXAS be paid to abandon its claims to part of New Mexico. This helped influence a critical number of northern Whigs in Congress away from their insistence upon the Wilmot Proviso—the stipulation that all land gained by the Mexican War be closed to slavery. Douglas's effective strategy in Congress combined with Fillmore's pressure from the White House to give impetus to the compromise movement.

Some of the more militant northern Whigs remained irreconcilable, refusing to forgive Fillmore for having signed the FUGITIVE SLAVE ACT. They helped deprive him of the presidential nomination in 1852, which went to General WINFIELD SCOTT. Within a few years it was apparent that although the compromise had been intended to settle the slavery controversy, it served rather as an uneasy sectional truce.

In the area of foreign policy Fillmore could claim some significant achievements, chief among them being the beginning of relations between the United States and Japan. Long closed to foreigners, Japan was “opened” by MATTHEW CALBRAITH PERRY with a fleet of American warships. Also, Fillmore did not support a failed filibustering expedition to Cuba by a proslavery group, receiving much southern criticism in the process.

As the Whig Party disintegrated in the 1850s, Fillmore refused to join the REPUBLICAN PARTY but, instead, in 1856 accepted the American, or KNOW NOTHING, Party nomination for President, only to lose to the Republicans. Throughout the Civil War he opposed President Abraham Lincoln, and during Reconstruction he supported President Johnson. He died in 1874.

### **Finney, Charles Grandison** (1792–1875) *revivalist preacher*

One of the leading evangelical preachers of the 19th century, Charles Grandison Finney was a key figure in the series of revivals known as the SECOND GREAT AWAKENING that swept parts of the United States in the 1820s and 1830s. Widely considered to be one of the most important figures in the religious history of the United States, he saw himself as acting firmly in the tradition of Protestantism as articulated by John Calvin and the American Jonathan Edwards, among others.

Finney was born in western Connecticut, near Warren, on August 29, 1792, to Sylvester and Rebecca Rice Finney, Yankee farmers who traced their ancestry to the Pilgrims of Plymouth. The Finneys later moved to upstate New York, settling first in Oneida County before moving to Henderson, in Jefferson County, when Charles was eight. After receiving an education in New York and Connecticut, he taught school in New Jersey. While still a young man, he returned to Adams in northern New York to apprentice with a lawyer.

Over six feet in height and a natural leader, Finney seemed to be heading toward a successful career in law and perhaps politics. While a practicing attorney, he began to turn his attentions more to matters of religion, reading the Bible and leading the choir of the Presbyterian Church in Adams. As many around him began to be caught up in the excitement of religious revivals in the 1820s, Finney despaired at ever experiencing a dramatic conversion that would change his heart and lead him to Christ. He promised God that if he were ever to have such an epiphany, he would devote the remainder of his life to preaching the Gospel. On October 10, 1821, as he neared his 30th birthday, Finney had such a dramatic conversion during a community revival meeting near Adams. Recognizing his talent and potential, the local Presbyterian clergy shortly authorized him to begin preaching. Soon after, he married Lydia Andrews; the couple had six children, four of whom survived to adulthood.

Finney's style from the pulpit was simple, direct, and highly effective. He spoke without notes, urging his listeners to commit their lives to Christ at that moment or risk damnation. He spoke of hell in very vivid terms as a real place that awaited those who failed to believe. He was so persuasive that many in his audiences would convert on the spot, falling to the floor and weeping as they did. He preached throughout upstate New York, meeting with special success in towns along the Erie Canal, such as Utica and Rome, and, later, in Rochester. These were places that were on the forefront of economic change in the United States, and Finney's message of redemption found many willing listeners among the new middle class of managers, business owners, and professionals. He preached a somewhat more optimistic brand of Christianity than traditional Calvinism in arguing that the individual was not necessarily predestined to damnation and could overcome his or her sinfulness by a conversion of the heart and by establishing a personal relationship with Christ through prayer.

One of the other keys to the success of Finney's revivals was that he persuaded people they were more likely to experience God's saving grace if they came into the presence of others who had already undergone a conversion. The saved and the unsaved alike would pray together publicly at Finney's revivals. Another part of his method was to come into a community and create excitement by having his assistants, some of whom were women, go door to door, encouraging families and groups of friends and neighbors to attend the revivals together. Then he would hold all-night prayer meetings in which the conversions, often theatrical in appearance, would follow one after another. In one of his most successful revival campaigns, in Rochester during 1830–31, Finney first made use of "the anxious bench," calling forward members of his audience to give their heart over to Jesus at the bench placed near his pulpit, adding to the dramatic effect. As he described his manner for saving souls in his book *Lectures on Revivals of Religion* (1853), which was based on his work at Rochester and other places, appealing to the individual's precarious situation was crucial. He would directly ask the persons sitting in the rows before him: "Will you submit to God tonight—NOW?"

Finney ranged far and wide in the Northeast in his preaching, traveling to Delaware, Philadelphia, Boston (where he met with mixed results) and New York City. He eventually linked his religious message to social-reform causes such as temperance, which drew the support of many evangelical Protestants. In 1835, he accepted a position teaching theology at the new Oberlin Collegiate Institute in Ohio. His Christian mission led him to observe strict guidelines on personal behavior, as he avoided alcohol, tobacco, and caffeine. He also became a vigorous abolition-

ist, and Oberlin developed into an important station on the Underground Railroad. His work at Oberlin did not stop him from continuing to preach throughout the northern United States, even after he came the president of the college at Oberlin in 1851.

During middle age, Finney had a crisis of faith after the death of his wife Lydia, but he came out of it with a renewed belief in the redeeming power of Christianity. He remained active into his later years, even after retiring as college president and pastor in the 1860s. As a staunch opponent of SLAVERY, he did not support Abraham Lincoln in either 1860 or 1864 because he considered Lincoln too cautious on the questions of emancipation and racial equality. He successfully completed his *Memoirs*, which was published after his death on August 16, 1875, in Oberlin. He was survived by his wife Rebecca, whom he had married after his second wife, Elizabeth, died.

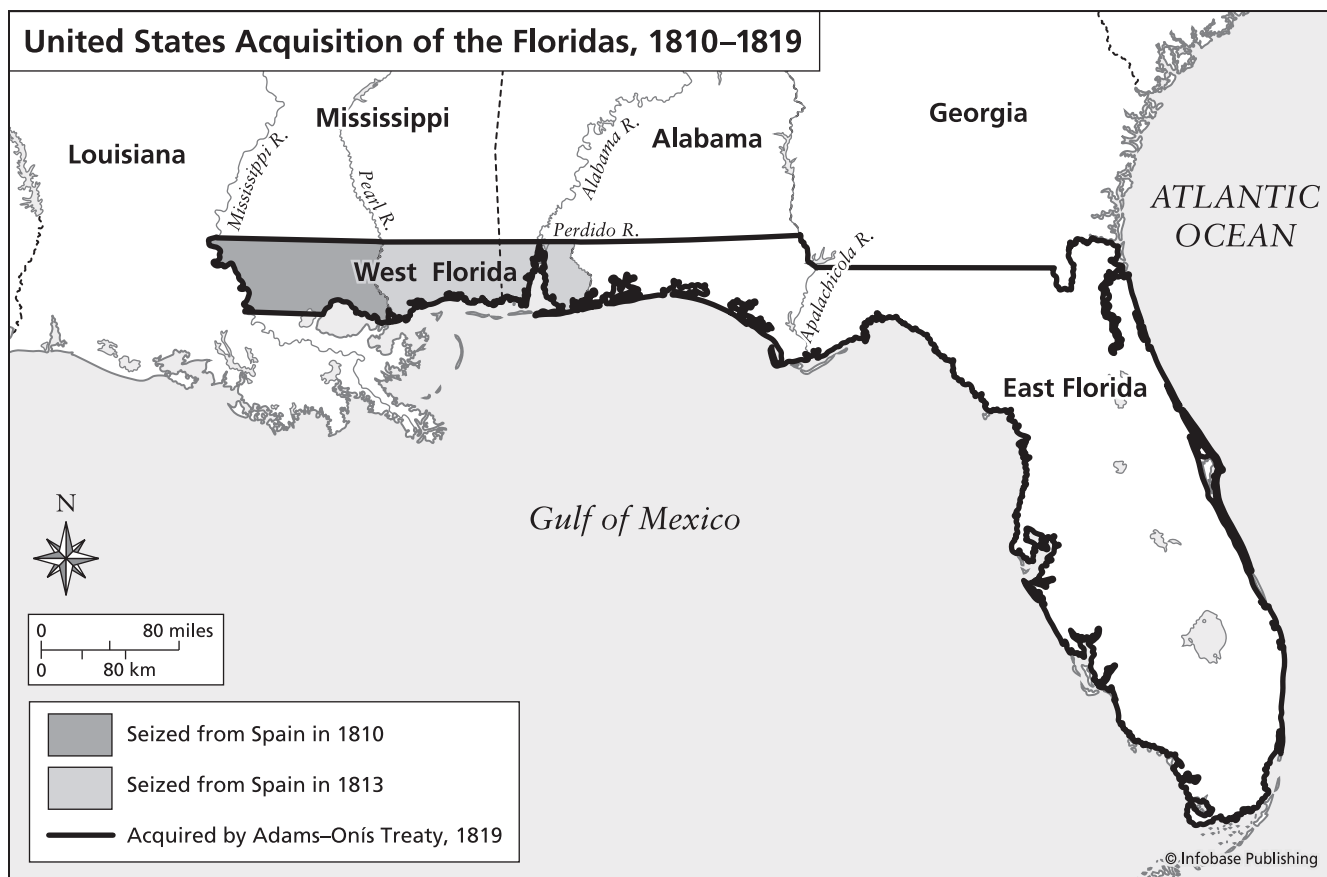

Charles Grandison Finney was a leading example of the evangelical and reform spirit which did much to shape the United States in the 19th century. A major figure of the Second Great Awakening and an innovator in terms of method, Finney considered himself a part of the great tradition of Anglo-American Protestantism and saw his duty as bringing the lone sinner to a new life in Christ.

## Florida, East and West

The area that is now the state of Florida was contested by the French, Spanish, British, and American governments for over a century before it became part of the United States in 1819. France and Spain fought a minor territorial war over the area in 1719. After fighting stopped, the two empires agreed that the border between French Louisiana and Spanish Florida would be the Perdido River (now the western border of the state). When France was defeated by Great Britain in the Seven Years' War in 1763, French Louisiana became the property of Spain, and Spanish Florida was given to the British. During this realignment, Britain claimed the strip of land running from the Perdido River west to the Mississippi River (what is now part of Alabama, Mississippi, and Louisiana), with the exception of the island of New Orleans, which remained Spanish. The British called this small, remote territory West Florida and administered it separately. They also extended West Florida eastward to the Apalachicola River and the town of

Pensacola, which became the capital of the territory. The area east of the Apalachicola, including the entire peninsula, became known as East Florida.

In the Peace of Paris ending the American Revolution in 1783, Spain reacquired both Floridas from Great Britain, including the strip west of the Perdido River that had once belonged to France. The Floridas were under the Spanish colonial government of Louisiana until 1800, when Spain secretly ceded Louisiana once again to France. When the United States purchased Louisiana from France in 1803, the status of the Floridas was unclear. The Treaty of San Lorenzo in 1795 fixed the northern border between the United States and the Spanish Floridas at the 31st parallel, which seemed to imply that the Floridas were still separate from Louisiana. With the purchase of Louisiana, however, the United States argued that the acquisition included East and West Florida. Putting aside the misleading, confusing logic of this claim, the American government pressed its case for ownership of both Floridas. They based their claim on two different arguments. First, the American government argued that Napoleon had sold the Floridas when he sold Louisiana. Second, if Napoleon did not sell Florida and it was still Spanish territory, Spain should give it to the

United States as compensation because the Spanish had not upheld the terms of the Treaty of San Lorenzo. The United States claimed that the Spanish had violated the treaty by failing to keep Indians from raiding American settlements and by protecting American slaves who escaped to Florida.

The dispute over which empire held the Floridas continued for the next 15 years. The United States slowly encroached on the territory, declaring West Florida a U.S. customs district in 1804 and then appropriating the territory up to the Pearl River in 1810. In 1812, most of West Florida was incorporated into the new state of Louisiana, while the section between the Perdido and Pearl Rivers became part of Mississippi Territory. In 1818, General ANDREW JACKSON invaded Pensacola, where he implemented violent frontier justice on those Spanish colonists who opposed him. The aggressive behavior of Jackson and President JAMES MONROE soon led to Spain's capitulation. In 1819, Spain agreed to the ADAMS-ONÍS TREATY, which ceded the Floridas to the United States.

Florida was a problematic territory not only because of contested ownership. It was ideally located to be a center for Caribbean trade, but the region's malarial climate

and treacherous geography made permanent settlement difficult for the Spanish, British, and Americans. Indian resistance to white settlement was also more persistent in Florida than anywhere else in the eastern part of the country. Jackson established a skeletal civil government in Florida Territory, and a territorial legislature was created by 1826. Settlement and economic growth seemed to be progressing until the SEMINOLE WARS and the PANIC OF 1837 temporarily shut down speculation in Florida's future. Only after the second Seminole war concluded in 1842 did the stabilized territory begin pushing for statehood. Florida was admitted as a slave state in 1845.

In retrospect, the international feud over Florida may seem unimportant, but this struggle can be seen as one of the first acts of an imperial United States in an effort to gain more territory. Through the annexation of Florida, the nation began to develop strategies for becoming truly continental. These aggressive tactics for expansion eventually led to conflicts with the Republic of Texas and Mexico, as well as the eventual acquisition of the territory between the Rio Grande and the 49th parallel.

—Eleanor H. McConnell

## foreign policy

National sovereignty, commercial freedom, and territorial expansion were the three primary objectives that shaped U.S. foreign policy over the course of the 19th century. Between 1800 and 1861, America emerged as a nation with great potential for global influence. The country expanded its borders from the Atlantic Ocean to the Pacific Ocean, while also establishing borders with Canada and Mexico. Before it plunged into the tragedy of the Civil War in 1861, the United States had begun cultivating what would become a seemingly insatiable hunger by the century's end for commercial, cultural, and military success beyond its own vast boundaries and onto the world stage. Success here was not always uniform or conducive to political unity, but events did have the effect of transforming the United States from a minor collection of states into a major world power.

At the dawn of the 19th century, the newly independent United States was grudgingly recognized by the great powers of Europe as a sovereign nation. Jay's Treaty with Britain (1794) and Pinckney's Treaty with Spain (1795) solidified U.S. territorial acquisition in the Northwest and Florida and secured American trade along the Mississippi River. Although these treaties represented a minor advance of U.S. legitimacy, the British and French continued their attempts to influence and manipulate the young and fragile nation.

The wars between Britain and France that raged in Europe during the early part of the 19th century provided the United States and its people not only with significant

challenges but also with great opportunities to achieve international integrity, commercial growth, and territorial acquisition. Despite its best efforts to remain neutral, the young nation was eventually swept up in conflict among several European powers. The United States and France nearly went to war over the so-called XYZ Affair in 1798, in which French officials demanded a bribe from American envoys in Paris as a prerequisite to begin negotiations over the growing differences between the two nations. Continuing disputes over U.S. neutrality in commercial shipping, over free navigation of the Mississippi, and over American use of the port of New Orleans heightened tensions.

Many of these problems were resolved in 1803, when the United States purchased Louisiana, including the port city of New Orleans, and vast, largely unexplored territories west of the Mississippi River from a financially strapped France. Although Napoleon Bonaparte had hoped to resurrect the French colonial empire in North America, his ambitions in Europe were more significant. Additionally, the inability of French forces to put down a slave rebellion on the Caribbean island of Hispaniola (now shared by Haiti and the Dominican Republic) led by the indomitable Toussaint Louverture severely limited the French emperor's designs on the Western Hemisphere. Although it meant abandoning direct influence across the Atlantic, the sale of the Louisiana territory provided Napoleon with sufficient funds to sustain his military campaigns in Europe and dreams of continental supremacy until his final defeat by Britain in 1815. The Louisiana Purchase was an unexpected windfall for the United States and President Thomas Jefferson, because he had instructed his emissaries to Paris only to acquire New Orleans and parts of Spanish Florida. With the Louisiana Purchase, the thrust of U.S. westward expansion took a great leap forward.

Although the United States avoided war with France, it would not do so with Great Britain. After 1803 and the resumption of fighting between Britain and France, the British resumed the seizure of American merchant ships suspected of carrying on trade with the French. The U.S. government demanded that the British respect American neutrality. Tension between the two nations mounted as the British navy ignored this demand and impressed over 10,000 American citizens into service. A frustrated President Jefferson and Congress knew that their navy was no match against the most powerful fleet in the world, so they first sought to boycott British imports. After this policy failed, the federal government imposed the 1807 Embargo Act, which was intended to harm Britain by denying it access to American raw materials. Like the boycott, the embargo also failed and, in fact, actually did more harm than good for American trade, as U.S. exports plummeted and desperate merchants continued to find ways to get their goods to Britain. Discouraged, Congress repealed the

act in 1809 and passed subsequent acts to stop the harassment of U.S. vessels by both the British and the French, but witnessed little success.

The conflict between the United States and Britain was only made worse by the part the British played in the U.S. war with Indian nations in the Northwest Territory. Led by TECUMSEH, the charismatic and fiercely independent Shawnee leader, these NATIVE AMERICANS violently resisted American encroachment onto their lands. The British entered into various alliances with these Indian nations and encouraged their struggles against U.S. domination. Most Americans saw British support as yet another in a series of insults and outrages. The tension between the two countries finally resulted in open armed hostility in June 1812, when President James Madison sent a declaration of war to Great Britain.

With war declared by Washington, American forces invaded Canada to stop the British support of Indian nations. The invasion achieved little more than a stalemate at the U.S.-Canadian border. Additionally, it created regional conflict in the United States because the residents of New England states, who had British sympathies, ignored illegal trade across the Canadian border and refused to support the American cause with troops or supplies. Because the small U.S. Navy was no match for their own, the British easily blockaded the Atlantic seaboard. British troops attacked, sacked and burned many coastal cities, including Washington, D.C. Meanwhile, the Indian wars of resistance continued in the Northwest and the South. American forces under the command of ANDREW JACKSON won significant military victories in 1814 against Indian peoples in these territories. Native American resistance was suppressed, and some of their lands were ceded as part of the burgeoning American nation. Finally, fatigue brought on by the Napoleonic wars in Europe compelled the British to end their war in North America. The two nations signed the TREATY OF GHENT in December 1814, with the British ending their advocacy for a separate, independent state for neutral Indian peoples. Because of poor communication, Andrew Jackson's famous victory over the British in New Orleans in 1815 actually happened after the treaty was signed. Notwithstanding what appeared to be only minor U.S. gains, the war was significant because it marked the final British recognition of U.S. independence. More important, the experience of war and the perceived "defeat" of Great Britain ushered in a period of intense nationalism, the so-called ERA OF GOOD FEELINGS.

The conclusion of the WAR OF 1812 signaled the emergence of the United States as an independent and sovereign world nation, although a relatively underdeveloped one. Over the next half-century, U.S. foreign policy focused on further territorial acquisition. JOHN QUINCY ADAMS, President JAMES MONROE's secretary of state, proved an excep-

tionally skilled diplomat. He was a shrewd negotiator and one of the chief architects of early 19th century U.S. foreign policy. Moreover, Adams was dedicated to a basic but far-reaching rapprochement with Great Britain, heretofore viewed as an implacable enemy. The War of 1812 had no sooner ended than Adams managed to sign the Commercial Convention of 1815, which opened most of the British empire to American goods and shipping. In 1817, he negotiated a fixed boundary between the United States and British Canada. This agreement, the Rush-Bagot Treaty, completely demilitarized the Great Lakes region between the United States and Canada, setting the tone for a generally unfortified border. Adams followed up with the Convention of 1818, which had the triple effect of establishing the border between American and British North America along the 49th parallel; securing a renewable, 10-year joint occupation of the Oregon Territory as far west as the Rocky Mountains; and also obtaining British guarantees to respect American fishing rights along the Grand Banks and in the North Atlantic. Despite this admirable start, relations deteriorated somewhat during the Patriot War of 1837–38 in Canada, when fighting spilled over the border and resulted in the destruction of the American vessel *Carolina* at Niagara. Tensions also increased along the border of Maine and New Brunswick during the so-called AROOSTOOK WAR of 1839, which was peacefully arbitrated and settled by the next significant agreement, the WEBSTER-ASHBURTON TREATY of 1842. Normal diplomatic relations with Great Britain then resumed. On April 19, 1850, both nations consented to the CLAYTON-BULWER TREATY, which declared joint use of a proposed Central American canal.

More significant, however, was Adams's diplomacy in acquiring the Spanish territories of Florida for the United States. Adams's negotiating position was greatly enhanced when an overzealous General Andrew Jackson invaded Spanish Florida in "self-defense" against Florida's Seminole Indians. The Spanish protested what they considered to be an act of U.S. aggression. However, Adams countered by making the argument that Spain did not have an adequate military presence in its Florida territories to prevent Seminole incursion into the United States. Spain, recognizing that it did not have the capacity to control the Seminole or, for that matter, American invasion forces, ceded Florida to the United States with the ADAMS-ONÍS TREATY in 1819 for \$5 million. It also settled the western boundary of the Louisiana Purchase (1803), with the United States relinquishing all claims to the province of TEXAS, if only temporarily. Five years later, Adams also managed to obtain for the United States those parts of Oregon claimed by imperial Russia, thereby bringing the nation closer to continental unification.

Under Adams's guidance, in 1823 President Monroe articulated the famous MONROE DOCTRINE that would

become one of the key pillars of U.S. foreign policy for the remainder of the century and well into the next. Monroe initially wanted to work jointly with the British in securing the independence of the region from European powers, backed by the formidable presence of the Royal Navy. But Adams successfully argued that the United States ought to be responsible for defending its own backyard without British help. The doctrine called for the end of colonization in the Western Hemisphere and promised U.S. protection of newly independent Central and South American countries from European intervention. Monroe declared that any attempt by the European powers to violate the sovereignty of these new countries would be viewed “as the manifestation of an unfriendly disposition toward the United States.” The nation would continue to take a special interest in the affairs of the Western Hemisphere throughout the 19th and 20th centuries, and Monroe’s original doctrine would be rearticulated in various forms such as Theodore Roosevelt’s Corollary at the turn of the century and the Good Neighbor policy of the 1930s.

Following Monroe’s presidency, U.S. territorial acquisition and Atlantic-to-Pacific consolidation became chief cornerstones of both foreign policy and American cultural identity. In 1845, journalist John O’Sullivan gave the American expansionist urge a name: **MANIFEST DESTINY**. He declared that it was America’s “Manifest Destiny to overspread the continent allotted by Providence for the free development of our yearly multiplying millions.” Inspired by this mission statement, Americans continued to pursue expansion with both impressive zeal and ruthless violence. What this meant in terms of foreign policy was a near-war with Great Britain over the Oregon territory and a two-year war between the United States and Mexico. Until 1846, Great Britain and the United States accepted joint occupancy of Oregon. President **JAMES K. POLK** sought to claim all of Oregon below the 54th parallel as solely American. Peace was maintained through the **OREGON TREATY OF 1846** that established the 49th parallel as the U.S.-Canada border. In exchange for this new boundary, the United States allowed the British to keep control of Vancouver Island.

Along the southern border, relations with the newly independent nation of Mexico were growing complicated as a result of continual American migration into the northern province of Texas. The Mexican government, eager to populate that spare region, had begun offering free homesteads to any settlers who wished to migrate under a system of sponsored immigration, provided that they obey Mexican law, practice Catholicism, and free all slaves. By 1836 the 30,000 Americans settled in Texas had largely evaded the law, but in that year a conservative revolution swept into power General **ANTONIO LOPEZ DE SANTA ANNA**, who vowed to bring the Americans to heel.

The ensuing Texas war for independence witnessed such bloody events as the fall of **THE ALAMO** and the Battle of **SAN JACINTO** and ended in a complete American triumph. The victors then formally asked to be annexed to the United States as a new territory, but presidents **ANDREW JACKSON** and **MARTIN VAN BUREN**, seeking to avoid further conflict with Mexico, declined their offer. Annexation sentiment also roiled growing Whig opposition in Congress, which adamantly resisted any extension of **SLAVERY**. But Democrats, more favorably disposed toward slavery, viewed annexation as a natural outlet for American liberty. In 1844 Whig president **JOHN TYLER** broke with his party over the Texas issue and authorized Secretary of State **JOHN C. CALHOUN** to secretly negotiate a treaty to that effect. After the Senate blocked it, Tyler circumvented the usual political channels by passing an annexation bill through a joint resolution of Congress, requiring only a simple majority. Thus, Texas became part of the United States on March 1, 1845. Mexico, which never recognized the move, angrily broke off all diplomatic relations with the United States and braced itself for war.

Polk’s claims for lands that belonged to or were claimed by Mexico led to the **MEXICAN-AMERICAN WAR (1846–48)**. His justification for armed conflict was the American annexation of **TEXAS**, which the Mexican government disputed. The Mexican army’s defeat by the forces of **SAM HOUSTON** in 1836 secured Texan independence from Mexico, and in 1845 the United States annexed Texas out of expansionist desires and concerns about foreign influence, namely that of the British. However, the Mexican government refused to recognize Texas’s annexation. Polk had larger designs than adding Texas to the nation; he was determined to acquire, by force if necessary, large portions of northern Mexico, including the territory of California and what would become New Mexico. Using the dispute with Mexico over Texas and the Rio Grande border as a pretext, the United States invaded its southern neighbor in 1846. American troops pushed easily down to Mexico City and forced the Mexican government to surrender. According to the terms of **TREATY OF GUADALUPE HIDALGO (1848)**, Mexico ceded to the United States two-fifths of its territory (including Texas, **CALIFORNIA**, and New Mexico) for \$15 million. Whether they liked or not, the inhabitants of these lands were incorporated into the United States.

The war with and victory over Mexico only whetted the American appetite for territory and bolstered the federal government’s confidence in international affairs. Polk offered Spain as much as \$100 million for **CUBA** in 1848, but his offer was rejected. President Franklin Pierce made a similar offer and even threatened the use of force to compel the sale of Cuba. He withdrew this intimidating offer, however, because of negative domestic public reaction.

The expansionist lust of some Americans spurred them on to seek territory in the Caribbean and Central America as private endeavors. During the early 1850s, these adventuresome Americans, also called filibusters, attempted to invade and conquer Cuba, Nicaragua, and even parts of Mexico. Ardent proslavery southerners who professed the doctrine of Manifest Destiny, these filibusters hoped to increase the power and influence of the slave states through conquest, but none of their private expeditions was successful. Foremost among them was William Walker, who was repeatedly arrested for filibustering activity in Mexico, Nicaragua, and Honduras. He was finally arrested and executed by a firing squad in 1860. Despite the filibusters' failure to seize new lands and that of U.S. presidents to buy them, Americans coveted much of what they saw south of Mexico for the remainder of the century.

U.S. expansionist desires did not stop in the Western Hemisphere. In an effort to establish a presence in the Pacific, to promote commerce, to find coaling stations and to protect shipwrecked American sailors, President MILLARD FILLMORE sent U.S. Navy Commodore MATTHEW CALBRAITH PERRY to "open" Japan. In 1853, four U.S. warships, two of them intimidating steam-powered vessels that belched black smoke, dropped anchor off the coast of Japan. Perry's efforts and determination to fulfill his orders produced in 1854 a commercial trade treaty with Japan. The Treaty of Kanagawa granted the Americans favored-nation status and opened up several ports to U.S. trading vessels. It also ensured the safety of all sailors who washed up on Japanese shores due to storms; previously, shipwrecked survivors were often tortured and executed by the xenophobic samurai regime. The Tokugawa Shogunate rulers of Japan capitulated to Perry's demands because of superior U.S. military power. They also hoped to avoid the humiliating domination several European powers exercised over other Asian nations like India and China. The "opening" of Japan was only a beginning for the United States. The Americans would return to the Pacific later in the century in order to seize the HAWAIIAN ISLANDS and, during the Spanish-American War (1898), to secure a more permanent foothold and influence in Asia.

U.S. international concerns took secondary importance when civil war erupted at Fort Sumter off the coast of South Carolina in 1861. Following the defeat of the Confederacy in 1865, the United States would once again return to an expansionist foreign policy. For the next half-century and beyond, Manifest Destiny would encourage U.S. commercial and territorial desires well beyond national borders and into Central and South America as well as the far-flung Pacific. The lives of millions had been and would continue to be irrevocably changed as the American expansionist juggernaut pushed west and south. By 1899, the expansionism that drove U.S. foreign policy for over a century

was ushering the country into the international arena and towards superpower ascendancy in the 20th century.

## Fort Laramie

Built by 1834 by fur traders, Fort Laramie was a focal point of the FUR TRADE, the CALIFORNIA GOLD RUSH, and relations with NATIVE AMERICANS over a half-century, until its closing in 1890. WILLIAM SUBLETTE and Robert Campbell built Fort William (its original name) at the junction of the Laramie and North Platte Rivers as part of the expansion of the fur trade onto the northern Great Plains. Like BENT'S FORT farther to the south, it was designed to become a focal point of contact and exchange between the traders and the surrounding Indians. The stockade was soon called Fort Laramie, after a French trader who had been killed on the Laramie River. The appearance of these fixed posts reflected the declining significance of the RENDEZVOUS as an instrument of contact and trade. In 1835, Sublette and associates sold the fort to another fur-trading company headed by Thomas Fitzpatrick, and the next year, the AMERICAN FUR COMPANY absorbed Fitzpatrick's group. The fort attracted the trade of the Indians from the Rocky Mountains as well as several groups of Sioux, confirming the significance of its location. The fur business was steady, but trading on the Platte was never as important as that on the upper Missouri or that of the southern Great Plains (Bent's Fort).

As the fur trade stagnated, the fort assumed another significance. Beginning in 1841, a growing number of settler families began an annual overland trek to Oregon over what became known as the OREGON TRAIL. For the west-

This painting shows a Native American encampment outside Fort Laramie in Wyoming. (Hulton/Archive)

ward pioneers, Fort Laramie became the first significant stop after leaving Independence, Missouri. After 800 miles on the overland trail, settlers, guides, and draft animals all used the fort as a site to rest, refit, and organize for the mountain challenges ahead. As the numbers of overland immigrants grew, from 1,000 in 1843 to 5,000 in 1845, the significance of the fort as an oasis on the land trail grew even as the fur trade declined.

In 1849 the U.S. government bought the fort as a military post. The previous year, gold had been discovered in CALIFORNIA. The California gold rush stimulated the largest overland immigration in the history of the republic. In 1849, some 80,000 FORTY-NINERS took the overland trail to California, and Fort Laramie became the most important landmark on their way West. Every Forty-niner diary—and there are more than 400 preserved—remarked on the arrival at Fort Laramie and the significance of the place to travelers heading west. Among its other services, the fort (now under the command of an Army officer) kept a register of wagons and a roster of immigrants. National newspapers used these numbers as evidence of the large numbers rushing to California in search of gold.

The large overland immigrations of 1849 and subsequent years were the work of inexperienced argonauts intent on reaching California to find gold. They saw the CALIFORNIA TRAIL, as it came to be called, as an obstacle

to their ambitions. Most of them carried too much, and the strain on their draft animals was obvious by the time they reached Fort Laramie. During the stop at the fort, the hurried and harried Forty-niners discarded weight and repacked their wagons. In the middle of the summer, observers commented on the piles of bacon and trunks outside the fort. Indians came not to trade but to pick up the bounty around the fort.

As the focus and number of immigrants to California shifted from overland travel to seagoing transportation in the 1850s, Fort Laramie became a focal point of relations between the U.S. government and the Indian nations of the northern plains. The California gold rush, the annexation of new lands through the TREATY OF GUADALUPE HIDALGO, and the signing of the OREGON TREATY OF 1846 had intensified Euro-American traffic across the plains. The fur trade had begun to decline, and the Indians' bargaining power was reduced as increasing numbers of non-Indians moved over what they regarded as their hunting areas. In an attempt to settle Indian affairs on the northern plains and to fit Native Americans into new national policies, the federal government convened a large gathering of Indians. The year was 1851, and the site of the meeting was Fort Laramie. Perhaps as many as 10,000 Indians attended a series of meetings.

With the doctrine of the permanent Indian frontier now obsolete, the Treaty of Fort Laramie (1851) laid down

federal policy toward the Indians of the plains. Even as nations east of the Mississippi River were moved to the vast area known as Indian Territory on the grounds that such landscape would never be attractive for American settlement, the movement of settlers farther onto the plains indicated that Indian policy must be recast. Under the terms of the Treaty of Fort Laramie, nations of the plains agreed to pursue peaceful relations among themselves and to permit the federal government to construct and maintain roads and other fixed posts within the Indian territories. The treaty also divided the northern plains into specific tracts for individual signatory nations. This division was part of the federal government's intention to assign specific boundaries to Indian groups, a legal nicety that was probably not clearly understood by the treaty signers. Even if the leaders had understood the various provisions, they lacked power to enforce their will on all members of their tribal groups, which were inherently decentralized. Among those who eventually affixed their marks to the treaty were representatives of the Sioux, Cheyenne, Arapaho, Crow, and Mandan nations. In return for these concessions, the federal government promised that the designated Indian lands would be theirs forever and that the government would protect the Indians from Euro-American trespassers. Finally, the representatives of the government agreed to pay annuities of supplies and provisions worth \$50,000 for the next 50 years.

In an arbitrary decision that would become a pattern of relations with the Indians, the Senate reduced length of the annuity to 15 years and increased the amount of goods to \$70,000. None of the Indian signatories agreed to these changes, and the peaceful respite was brief. The continuing movement of Euro-American settlers onto the plains, which accelerated after the Kansas-Nebraska Act (1854), produced the inevitable physical confrontations. The COLORADO GOLD RUSH and the immigration of 50,000 gold seekers across Kansas and Nebraska in the summer of 1859 brought the situation to a head. The large numbers of Colorado Fifty-niners were competitors for the scarce natural resources of the plains, making subsistence for the Plains Indians difficult if not impossible. Conflict between the two groups produced the inevitable number of depredations and reprisals, and within a decade of the great gathering and treaty-making exercise at Fort Laramie, the arrangements for peace had irrevocably broken down.

Fort Laramie remained an important post on the plains for another generation. The enlarged American presence in the form of settlers, the Pony Express, the telegraph, and, finally, the railroad led to escalating clashes. The American government was preoccupied by the Civil War, but with the end of this conflict, expansion onto the plains accelerated. The great Sioux War of 1876 was the most noteworthy example of U.S. and Indian clashes but far from the only

one. Meanwhile, Fort Laramie continued to play a central role in affairs on the plains until its closure in 1890.

### Fort Leavenworth

The U.S. Army established Fort Leavenworth in 1827 in what would become the territory and later state of Kansas, at the head of the SANTA FE TRAIL and OREGON TRAIL. It was named for Colonel Henry Leavenworth, one of the army officers most associated with the frontier. Built to protect western travelers and maintain a military presence against the Plains Indians, the fort was a significant anchor to American defense in the West.

Fort Leavenworth was the staging site for several important expeditions to the West, one commanded by Colonel Henry Dodge (1835) and two others led by Colonel (later General) STEPHEN WATTS KEARNY (1839 and 1845). On the outbreak of the MEXICAN-AMERICAN WAR in 1846, Kearny gathered a force of 1,600 at the fort, trained and outfitted his army, and began his trek to conquer New Mexico and California. During the Civil War, Fort Leavenworth served as an important supply depot and as the headquarters of the Department of the Missouri. In 1881, the army established a Command and Staff School at the fort, and this course of study became the required career step for all officers of staff rank. As such, the fort and its environs became one of the few (along with West Point) common factors in the experience of career officers. It continues to fill that same function up to the present day.

### Fort Vancouver

The Hudson's Bay Company (HBC) built Fort Vancouver in 1824–25 to serve as the headquarters of its Columbia Department. The HBC was locked in a continuing competition with the AMERICAN FUR COMPANY of JOHN JACOB ASTOR for control of the rich FUR TRADE in the Pacific Northwest. Fort Vancouver—located on the north bank of the COLUMBIA RIVER about six miles from the mouth of the Willamette River (the gateway to the interior of the Oregon Country) and some 100 miles from the Columbia's mouth—was intended to perform the functions of physical presence and trading center, to rival Astor's ASTORIA.

For a quarter-century after its founding, Fort Vancouver dominated the trading and commercial life of the

the ports of Portland, Boston, Nantucket, New York, and Philadelphia on the East Coast; and, farther to the South, from Wilmington, Charleston, and New Orleans, bound for the goldfields of the new El Dorado in California.

With the coming of spring in 1849, a great body of Forty-niners assembled in the staging towns of Independence and St. Joseph in Missouri. There, they organized into companies, bought mules and broke them to the harness, acquired wagons, elected officers, and drew up constitutions. They also packed and repacked their supplies in order to conform to the general rule that with four men to a wagon, each could not exceed 250 pounds. The overland Forty-niners, using mules or oxen, would travel to California by traditional means, using the same wagons that had carried their grandparents to Ohio and Kentucky and parents to Wisconsin and Missouri and Mississippi. Overland Forty-niners expected to make the trip for a cost of about \$250. The wagon trains would follow the OREGON TRAIL through SOUTH PASS, where they would turn west and then south for California. The distance of some 2,000 miles had to be covered by late September, when the snows would close the passes of the Sierra Nevada. Furthermore, the many wagon trains would become competitors for the same grass and water. Because grass would not appear on the prairies in sufficient growth to support draft animals until the end of May, all parties of overland Forty-niners had to leave at about the same time.

The overland Forty-niners left with strong feelings about the search for gold and the enterprise on which they were about to embark. They believed, first, that they were going to become rich, or so the stories from California indicated; the sober, hard-working miner must invariably make a fortune. Second, they were convinced that this wealth could be used for the benefit of the family as a whole. In this sense, the venture was not selfish but something for the advantage of many. Third, they supposed that they were doing both God's will and the national will. After all, part of the issue in the enterprise was to assist in the transformation of California (recently acquired through the TREATY OF GUADALUPE HIDALGO) from a Mexican to an American cultural identity. The Forty-niners saw themselves as embodying the ideas associated with MANIFEST DESTINY. Finally, the Forty-niners had a strong sense of history and the significance of their overland enterprise. They were part of a long line of heroic pioneers who opened the West for the benefit of the nation. Part of the evidence of this strong belief was the number of journal keepers on the overland voyage to California. Some 400 diaries and journals of Forty-niners survive for the summer of 1849 alone, and many others must have been lost. Their entries, taken in conjunction with the letters that the argonauts sent to their families, confirm their sense of a national destiny of which they were a part.

The Forty-niners had to cross 2,000 miles in five months. To assist them, they had companies of friends and relatives, constitutions that identified the responsibilities of every member, and elected officers. They were well equipped—although many had packed more weight than the livestock could carry over the journey—and they were heavily armed. Indeed, accidents with firearms would become one of the major sources of casualties. Another was the cholera epidemic of that summer, which reached the departure towns of St. Joseph and Independence and often went west with the Forty-niners. Dangers from Indians, of which all Forty-niners were conscious, turned out to be limited to occasional theft.

Once arrived in California, most Forty-niners ceased to keep a journal and dispersed to the mining camps to dig for gold or to the numerous and growing towns of California's gold-rush country, where they sought other ways to profit from the search for gold. Yet each one had been welcomed to that mystical club of Forty-niners that would become so significant in later life, in recounting the travels and deeds that made them a part of America's westward march of empire. The annual migrations to California continued for the next decade, increasingly by sea as steam connections joined the Atlantic Coast ports to Panama and the steamers on the West Coast side carried cargoes of later Forty-niners to California.

Within a few years, many Forty-niners returned to their homes. Their arrival was celebrated by their families if not always by their creditors. They resumed their lives in their communities, although some later moved elsewhere. Others remained in California to make their lives on the West Coast. Some simply disappeared from view, forever lost to their families in the vast landscape of the West. For those who returned or even those who remained in California, their years as a Forty-niner were almost certainly the most memorable of their otherwise routine lives. Forty-niners began to remember and celebrate those years as pioneers, individually and collectively. Some joined in family celebrations, perhaps on the date that the absent argonaut had returned. Others came together in groups, with annual dinners, speeches, and list of members.

The term Forty-niner came to have a general application to all those who went to California in search of gold over a decade, but the nation's true Forty-niners were forever enshrined in a special category. Not even the Civil War and its half-century of remembrance could diminish the permanent identification associated with the Forty-niner. Songs, speeches, poems, stories, and stage plays about Forty-niners served as a reminder of the time when America went west to California in search of gold.

Harvard University Press, 1947); Malcolm J. Rohrbough, *Days of Gold: The California Gold Rush and the American Nation* (Berkeley: University of California Press, 1997).

**Foster, Abigail Kelley** (1811–1887) *activist*

Abigail Kelley Foster was a prominent abolitionist and advocate of WOMEN'S STATUS AND RIGHTS. Abby Kelley was born January 15, 1811, in Pelham in west-central Massachusetts. She was the fifth of Wing Kelley's seven children by his second wife, Diana Daniels. Abby spent her childhood in the rural districts of Worcester, Massachusetts, where her family moved in 1811. Reared in the Quaker faith, she early developed a spirit of independence and moral commitment, after completing her education, which according to her daughter included several years at the Providence Friends School. She then became a teacher in the Friends school at Lynn, Massachusetts. While there, she was converted to the ABOLITION MOVEMENT through reading William Lloyd Garrison's *Liberator*. As secretary of the Lynn Female Anti-Slavery Society, she circulated petitions, distributed literature, and raised funds. Also an officer of the Lynn Female Peach Society, she was among the first to accept Garrison's radical doctrine of nonresistance, and in 1838 she joined him in founding the New England Non-Resistant Society.

In 1837 Kelley attended the first national woman's antislavery convention in New York, where she met ANGELINA AND SARAH GRIMKÉ. When these abolitionist sisters lectured in Massachusetts that summer, the friendship deepened. Kelley shared with them the Quaker conviction that men and women were equally susceptible to the promptings of the "inner light,") and by December 1837 she was convinced that to "improve mankind" was "the only object worth living for."

Her deepening concern with both antislavery and the role of women in public life was demonstrated in May 1838, when she made her first public address before a "promiscuous," or mixed, audience, at the second women's antislavery convention. Held in Philadelphia at Pennsylvania Hall, the hall was burned to the ground by a proslavery mob after only one day. So effective was her speech that THEODORE DWIGHT WELD begged her to become an abolitionist lecturer, exclaiming, "Abby, if you don't, God will smite you!" Influenced by such appeals, she resigned her teaching post and returned to Millbury, Massachusetts, where her family had moved, for six months of soul-searching and studying in preparation for a reformer's vocation. Encouragement from the Grimkés, reformist and abolitionist Henry Wright, feminist and abolitionist LUCRETIA MOTT, and others helped counteract family efforts to dissuade her.

In May 1839 in Connecticut, Kelley began her long and tempestuous career as a lecturer and agitator. One vil-

lage minister denounced her, taking as his text a Biblical reference to "that woman Jezebel, which calleth herself a prophetess." In Norfolk, where Kelley was forbidden to speak, a hotelkeeper explained that they believed her to be a bad woman, no better than the vilest of New York. Undaunted, she declared in the *Connecticut Observer*: "Whatever ways and men are right for men to adopt in reforming the world are right also for women to adopt in pursuing the same object." Notoriety also had its rewards, as the spectacle of a woman addressing the public attracted listeners otherwise cool to the anti-slavery message.

The abolition movement at this time was deeply troubled by dissension between moderate and radical factions over nonresistance, the role of women, political action, abusive language, and anticlericalism. These were all matters on which Abby Kelley had firm views, and she played a part in the open break, which came at the 1840 convention of the AMERICAN ANTI-SLAVERY SOCIETY. When a conservative attempt to block her appointment to the business committee was defeated by a vote of 560-450, a large block of delegates left the conference and organized a new antislavery group.

During the next 15 years Abby Kelley traveled great distances, carrying her message throughout New England and into New York, Pennsylvania, Ohio, Indiana, and Michigan. Preaching Garrison's doctrine of "No Union with Slaveholders" and his denunciation of the constitution as "a covenant with death," she also helped to advance the feminist cause by opening public platforms to women. In March 1841, she resigned from the Society of Friends because of its equivocal position on slavery. She then joined a small band of radicals who disclaimed allegiance to both church and state. One of these companions in the early 1840s was Stephen Symonds Foster, a New Hampshire radical who, after leaving Dartmouth with the intention of studying theology, had rejected all clerical institutions as proslavery and set out to topple them. He often interrupted religious services to denounce slavery. In 1843, he published the "Brotherhood of Thieves, or, A True Picture Of The American Clergy and Church."

In Foster, Abby Kelley found a man thoroughly in sympathy with her beliefs and practices. Their courtship extended for four years as their desire to wed conflicted with their devotion to abolition. Finally married on December 21, 1845, in Pennsylvania, they thereafter often traveled as a lecture team. A noteworthy example of their effectiveness together occurred early in 1846 when they visited Oberlin College during a religious revival. In a series of meetings that drew much interest, they attacked preachers, politicians, and the government. The faculty, including the evangelist CHARLES GRANDISON FINNEY, denounced them as infidels. Nevertheless, they returned

in the fall, at which time Stephen conducted a brawling debate with Oberlin's president, Asa Mahan. At least one Oberlin student, Lucy Stone, was as deeply moved by the Fosters' visit as the faculty was dismayed.

An acrimonious break with Garrison, under whose strict regime the Fosters became increasingly restive during the 1850s, pushed Foster further to the margins of the movement. By 1856, the Fosters had become convinced that abolitionists must organize politically, or the growing Republican Party would win over their supporters with halfway measures. Their demand for an abolitionist third party was too extreme for Garrison, who saw some good in the rise of the Republicans. In 1859, at the annual meeting of the New England Anti-Slavery Society, Garrison publicly accused Foster of dishonesty in collecting funds. Although tempers cooled after the Civil War, the rift was never fully healed.

With the exception of a final fund-raising tour of New England in 1870, poor health and a failing voice generally limited Abby Kelley Foster, postwar activities to local affairs. She died on January 14, 1887.

### **Fourier, Charles** (1772–1837) *socialist philosopher*

A French philosopher whose ideas influenced several American utopian movements, Charles Fourier was born at Besançon in 1772, the son of a businessman. Largely self-educated, he had hoped to join the military as an engineer but instead joined the family business, working as a tradesman in Marseilles. His lack of interest and skill in the business world, coupled with the family firm's financial difficulties, led him to abandon the trade in 1799 and take a job as a civil servant in Lyons. He wrote his first book, *The Social Destiny of Man: Or, Theory of the Four Movements*, in 1808. Little else is known about his life until 1816, when he inherited money from his mother and began spending all of his time writing. In 1823, he moved to Paris, where he would live and write until his death in 1837.

While Fourier's theories contained singular and peculiar interpretations of the cosmos, he also analyzed the burgeoning capitalist society around him. It is for these ideas about the social order that he is remembered today. Troubled by the chaos and volatile imbalances he saw in capitalist societies, Fourier proposed to reorganize them into balanced structures that would create social harmony. These new organizing units would be called phalanxes, agricultural groupings in which people worked on the tasks for which they were most suited, thus shedding the confines of industrial life and cultivating their whole selves.

Each phalanx would live in a community dwelling called a phalanstery, where all residents could live in the apartments that best fit their budgets (Fourier even planned the dimensions of the rooms). Each phalanstery would operate efficiently and profitably by centralizing daily activities such as eating and cleaning and by assigning all other kinds of work to the people most interested in doing them. Fourier predicted that people would compete in a friendly way, thus producing good products without creating conflicts. All profits would be community property, divided among members of each phalanx along these lines: five-twelfths to labor, four-twelfths to capital, three-twelfths to ability.

Phalanxes would thus be cooperative organizations, where workers would ideally become part-owners as well. Once the entire world had been divided into phalanxes, human society would become more ordered and harmonious. Capitalist impulses would not be abandoned, but rather redirected. In Fourier's utopian vision, humankind would be able to cultivate the positive aspects of industrial capitalism (such as productivity and ingenuity) while eliminating the venality and despair that he saw in the industrial societies of his time.

Despite the bizarre aspects of Fourier's world view, his theories attracted numerous followers, most notably in France and the United States. His utopian notions about human perfectability corresponded well with some of the ideas being expressed by transcendentalists and religious reformers in America. The most famous American community to adopt Fourierist principles was BROOK FARM, which operated in Massachusetts from 1841 to 1847. Other Fourierist phalansteries were founded during these years, but none lasted long.

While Fourier's ideas seem impractical and naïve today, he and other utopian socialists are historically significant because they criticized a capitalist system that was creating enormous social change, anxiety, and financial insecurity, and proposed to reorganize society through rational planning and humane working conditions.

### **Franklin Institute**

The Franklin Institute, organized as a memorial to Benjamin Franklin (1706–90), sought to study and promote mechanics and the applied sciences. Founded in Philadel-

phia in 1824, it is the oldest such institution in the United States. The institute publishes a peer-reviewed scientific journal on new theoretical developments and their practical applications, especially in engineering and mathematics; the *Journal of the Franklin Institute* has been issued continuously since 1826. The institute also bestows the annual Bower Award and Prize for advances in science and technology, as well the Cresson Medal, the Franklin Medal, and other awards and prizes. The list of its honorees includes Alexander Graham Bell, Marie and Pierre Curie, Thomas Edison, Albert Einstein, Max Planck, Niels Bohr, and a host of other leading scientists.

The institute was incorporated as the Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, and its first headquarters was in Independence Hall (then the Philadelphia County Court House). Intended as a lasting tribute to Franklin, the statesman, printer, and writer who was also well known for his scientific experiments and inventions, the institute's headquarters incorporates an impressive Franklin memorial and museum complex that was erected in 1933. Today, the Franklin Institute Science Museum includes exhibits on mechanics, aviation, meteorology, anatomy, electricity, transportation, astronomy, and the elements—some of the many subjects in which Franklin himself was most interested. A major part of its mission is providing educational programs for children, in the hope of inspiring new generations of scientists and inventors.

## Free-Soil Party

The Free-Soilers were a small but influential political party that came into existence in 1847–48 and opposed the extension of slavery into the western territories. Democratic factionalism in a single state created the new Free-Soil Party. The New York Democratic Party represented a complex coalition particularly sensitive to shifts in national, state, and local developments. One of the most important of the northern state organizations, it achieved direct national importance with the 1836 election of MARTIN VAN BUREN, but his unwillingness to cooperate in the admission of TEXAS to the Union led to his abandonment by the party's southern wing in 1840 and its fierce hostility to him in 1844. On a statewide level, the party divided between “Hunkers” and “Barnburners,” with whom Van Buren was identified. When the tenant-farmer and rural vote shifted against the Democrats, Barnburners blamed the Hunkers. Barnburners also opposed President JAMES K. POLK's use

of patronage to secure southern control of the national party through Hunker cooperation.

The Wilmot Proviso was the cause of much debate. Introduced by David Wilmot—a Democrat from Pennsylvania—the proviso stated that the institution of slavery was forbidden in territories acquired from Mexico. The Democratic state convention at Syracuse on September 29, 1847, split over adopting the Wilmot Proviso, as the Barnburners walked out. The Hunkers met January 26, 1848, at Albany while the Barnburners held their own convention on February 16 at Utica. Both sent delegations to the May national convention at Baltimore. The conflict over which New York delegation should be seated split the party nationally. In the end, the Barnburners withdrew, calling another national convention for Utica, June 22. Delegations from Wisconsin, Ohio, Illinois, Massachusetts and Connecticut joined the Barnburners there to nominate Van Buren. The convention then called for another national convention to unite the country on a “free-soil” basis.

There were already several such moves underway. A similar convention had already been called by the People's Convention of Friends of Free Territory, which met in Columbus, Ohio, on June 20. The WHIG PARTY's nomination of ZACHARY TAYLOR at their convention on June 7 led to the departure of the “Conscience Whigs,” which itself consisted of two factions, and the LIBERTY PARTY with its National Reform allies.

The Buffalo convention of August 9 was bedlam, more like a public mass meeting than a delegated convention. Managed by the Barnburners, a Committee of Conference transacted all the business while the majority sat in a big tent to hear speeches. The platform pledged to discourage slavery, abolish it where possible (e.g., in the District of Columbia), prohibit its extension, guarantee retrenchment, provide cheap postage, abolish unnecessary offices, create more elective offices, promote internal improvements, secure a homestead law, pay the public debt, and levy a tariff for revenue. Conscience Whigs generally concurred, although they had little confidence in the Barnburner Democrats who seemed to see the movement primarily as a means to put the Democrats back on the right track.

The party had momentous importance for the antislavery movement. Noted abolitionist William Lloyd Garrison thought the party was a good beginning toward a loftier goal, “a party for keeping Free-Soil and not for setting men free.” Other political abolitionists and National Reformers around Gerrit Smith favored retaining the Liberty Party. Still, most abolitionists, including the prominent black spokesman Frederick Douglass, supported the party of “Free Soil, free speech, free labor, and free men.”

The new party threatened components of both the existing parties. Whig statesman DANIEL WEBSTER called them “Free Spoilers” and the *National Intelligencer*

This cartoon depicting the Free-Soil controversy lays on the Democrats the major blame for violence perpetrated against antislavery settlers in Kansas. (Hulton/Archive)

denounced their hypocrisy and insincerity as a device for Van Buren's revenge. *The Democratic Washington Union* called the party simply a gathering of Whig Abolitionists. Free-Soilers in the "Old Northwest" demonstrated both the values and pitfalls of coalition politics. Michigan Free-Soilers rallied Whigs and others hostile to Democratic leader LEWIS CASS, while Ohio Free-Soilers worked with the Democrats who declared for free territory. In the 1848 election, Van Buren polled 291,616 votes, and the Free-Soil party elected 14 congressmen and two senators.

In Massachusetts, Henry Wilson and Charles Sumner engineered an understanding of sorts between the Free-Soilers and the Democrats who were desperate to overthrow the Whig dominance in the state. By 1850, the tentative coalition had won a majority in the legislature in which Free-Soilers agreed to leave the state offices to the Democrats in return for the Senate. As a result, Sumner joined the growing antislavery contingent in Washington.

In some ways, the party seemed to lose much in the East after the elections, as the New York Barnburners soon drifted back into the Democratic Party. However, the two major parties rallied to the COMPROMISE OF 1850 and its

new fugitive-slave provision, repudiating some of its state and local professions of sympathy for Free-Soil.

While the process lost the party politicians, it radicalized its electoral base, particularly in the Old Northwest. The unrepentant Free-Soilers attacked these policies. Former Democrats like Preston King and David Wilmot and former Whigs like Giddings, Henry Wilson, and Charles F. Adams would not return to their old parties. An 1851 Cleveland, Ohio, meeting of the remaining leaders called a national Free-Soil Democratic Convention to meet August 11, 1852, at Pittsburgh. Under Giddings, this enthusiastic convention proclaimed themselves "Free-Soil Democrats," "Independent Democrats," or, most commonly "Free Democrats." It adopted a platform based on the 1848 Buffalo platform, but added planks condemning the Compromise of 1850 and the Fugitive Slave Bill, denouncing South Carolina's seamen laws, demanding recognition of Haiti, and stating that it was the duty of the U.S. government to protest against European monarchical intervention in countries trying to establish republican governments. The party nominated a presidential ticket of John P. Hale of New Hampshire and George W. Julian

of Indiana as his running mate. In the 1852 election, the ticket polled only 156,297 votes, but these were far more radical than the earlier Free-Soil Party votes.

The party disappeared with the 1854 crisis over Kansas and the emergence of the new REPUBLICAN PARTY.

### Free Trade and Sailor's Rights

This political slogan became popular as the United States entered the WAR OF 1812 (1812–15). It represented in succinct form the two main maritime grievances that Americans had against Great Britain. “Free trade” referred to the various impositions that Great Britain had put on American neutral trading in the midst of the French Revolution and Napoleonic Wars (1793–1815), including the Essex Decision (1805) and the Orders in Council (1806–12). Americans claimed that as neutrals they had a right to trade with any country, whether that nation was at war with Great Britain or not. “Sailor’s rights” referred to the right of a sailor to contract for himself on American merchantmen ships, and that once he did so, he should be protected from being seized and forced to serve in the British Navy.

Although it remains unclear when the slogan first appeared, it quickly gained widespread usage in the maritime community. Politicians like HENRY CLAY used the phrase in the halls of Congress, and it appeared in several publications. American privateers and warships sometimes flew a pennant from a mast with the slogan emblazoned on it. Captain David Porter raised such a banner from the masthead when he headed for the Pacific on the USS *Essex* in 1813, and Captain James Lawrence flew a similar banner when he left Boston aboard the *Chesapeake* to fight the HMS *Shannon* in May of the same year. American sailors made the slogan their own. When the captives held at DARTMOOR PRISON heard of the TREATY OF GHENT (1814), they were excited that they would soon be released. Confident that both impressment and limitations on American commerce had been ended by the treaty—officially it did not deal with either issue—they raised an American flag and a pennant proclaiming “Free Trade and Sailor’s Rights” over the British compound. For many years thereafter, the slogan would appear occasionally as a statement not only of sailors’ rights but of the rights of the poor. Day laborers in New York City struck for higher wages in 1816 and used a banner with the slogan on it. Whalers etched the phrase on whalebone for decades, and as late as 1840, banners appeared in election campaigns proclaiming “Free Trade and Sailor’s Rights.”

### Frémont, Jessie Benton (1824–1902) *writer, politician*

Born the daughter of leading Jacksonian Democrat THOMAS HART BENTON and his wife, Elizabeth, and later married to famous explorer and presidential nominee JOHN C. FRÉMONT, Jessie Benton Frémont was a strong presence and accomplished individual in her own right. She was born Jessie Ann Benton on May 31, 1824, on her grandfather’s estate in the Blue Ridge Mountains of Virginia. As a young girl, she was known for her strong and energetic personality; the family often commented how she took after her father, a U.S. senator representing Missouri.

The Bentons had six children, but Jessie, the second-born, was usually the center of attention. The family spent part of each year in Washington, and Jessie as a young girl would accompany her father to the Capitol and also to the White House when he called on his friend and political ally, President ANDREW JACKSON. Jessie also spent considerable time at her grandparents’ estate in Virginia as well as in St. Louis, where her parents had a home. She was educated in Washington, however, at Miss English’s Female Seminary in Georgetown. It was in Washington that she met and fell in love with John Frémont, then a lieutenant in the Topographical Corps of the United States. Although her father was strongly opposed to the two getting married, in part due to his teenaged daughter’s youth, Jessie Benton and John Frémont were married in Washington, D.C., on October 19, 1841.

Jessie Benton Frémont did not join her husband on his government-sponsored travels and explorations in the western part of the continental United States, but she was instrumental in popularizing accounts of his expeditions (which included the scout KIT CARSON). In addition to raising the couple’s children, she and her husband collaborated on a series of reports, mainly written by Jessie, that proved to be very popular with the reading public. These reports included valuable and generally accurate scientific and topographical information, and also told of the natural beauty and adventures encountered on Frémont’s expeditions. In 1849, she traveled west with her young daughter to meet her well-traveled husband and later published an account of her own journey, including observations on the environment in California, as *A Year of American Travel*.

During the 1850s, the Frémonts lived in both San Francisco and Washington, when John Frémont represented California briefly in the U.S. Senate and then ran for president in 1856 as the first nominee of the new REPUBLICAN PARTY. Although they made a strong initial showing, the Republicans went down to defeat. Jessie Benton Frémont, however, made a positive impression during the campaign and was the center of attention in a way that was truly remarkable for a woman in 19th-century America. Only 32 years old, she had charmed many of the leading

politicians of the day, impressing them with both her vivacious personality and sharp intellect.

During the Civil War, the Frémonts entered in the national spotlight again when John C. Frémont was a general in the Union army. With Jessie at his side, he ran afoul of the Lincoln administration, in part because he had emancipated slaves in Missouri without prior approval from Washington. Relations between President Lincoln and the Frémonts deteriorated rapidly; at one point Lincoln denounced Jessie Frémont as “a female politician” and she in turn referring to him as “sly” and “slimy.”

After the war, Jessie Frémont and her husband were much less prominent on the national stage, although she continued to write, publishing a number of stories for periodicals on her travels and history as well as some children’s stories. John C. Frémont died in 1890, and Jessie lived for 12 more years, remaining active in women’s clubs until her own death in Los Angeles in 1902. Given the norms of the society in which she lived, it would have been quite understandable if she had been entirely overshadowed by her dynamic and powerful father and husband, yet Jessie Benton Frémont succeeded admirably in making her own mark on the world.

**Frémont, John C.** (1813–1890) *explorer, soldier, politician*

Previously well known as a western explorer and adventurer, John Charles Frémont, referred to as “The Pathfinder,” was the first presidential candidate of the REPUBLICAN PARTY in 1856. He was born on January 21, 1813 in Savannah, Georgia, to Jean Fremon, a French immigrant, and Anne Beverly Whiting, who were not married. The young Fremon was five when his father died, and he grew up in Charleston, South Carolina, in circumstances that were less than prosperous.

Having added a t and an accent to his name, John C. Frémont as a young man was notable for being ambitious and proud as well as somewhat reckless and headstrong. After working in a Charleston law office, he entered the College of Charleston in 1829. Although considered very bright, especially in mathematics, he proved to be an indifferent student and was expelled for “incorrigible negligence” before he could graduate. He did, however, apply for and receive his degree five years later. Frémont later joined the navy as a math teacher, but resigned his commission to enlist in the U.S. Army as a second lieutenant

in the late 1830s, joining a topographical study charged with surveying Cherokee lands in northwestern Georgia. This was Frémont’s first real work as an explorer, and he took an instant liking to it, saying later in his memoirs that “through many of the years to come the occupation of my prime of life was to be among Indians and in waste places.”

After the Georgia survey was finished, Frémont, who spoke French, was assigned by the U.S. government to assist Joseph Nicollet, a scientist and explorer from France who was surveying the land between the upper Mississippi and Missouri Rivers. Nicollet was among the best in his field, and he gave Frémont a solid grounding in natural sciences as they pertained to western exploration in the United States. Upon returning to Washington, the two men collaborated on a report of their travels and a map of the lands they had surveyed together. Senator THOMAS HART BENTON of Missouri, a vigorous champion of western expansion, invited them to his home to discuss their findings, and it was there that Frémont met Benton’s teenaged daughter, Jessie. The two fell in love almost immediately, but Senator Benton thought his daughter too young to marry and arranged to have Frémont sent west to make an expedition in the Iowa Territory. Although Frémont went to Iowa and produced a generally reliable map, the journey did nothing to stem his romance with Jessie Benton, and the two (both Protestants) were married in secret by a Catholic priest in Washington in October 1841. Frémont thus gained not only a wife in JESSIE BENTON FRÉMONT but an influential patron in the powerful Senator Benton.

The following year, Frémont led his first major expedition along the OREGON TRAIL, and afterwards, with much assistance from his wife, he published *A Report of the Exploring Expedition to Oregon and California*, which captured the nation’s imagination with its vivid descriptions of natural wonders and riches awaiting brave adventurers. It was on this trip that Frémont first met KIT CARSON, a scout who became famous in his own right from his travels with the Pathfinder. The two undertook another large expedition in 1843, traveling west from the Missouri River toward the Oregon territory, investigating the Great Salt Lake, going into Nevada and in the winter crossing over the Sierra Nevada and into CALIFORNIA, which then belonged to Mexico. The journey took the party nearly 6,500 miles, and the Frémonts subsequently published *A Report of the Exploring Expedition to Oregon and California*. The report was widely popular, as it included tales of adventure, scientific information, and a well-drawn map, along with information for anyone seeking to move west.

As relations between the United States and Mexico worsened, President JAMES K. POLK approved a third expedition for Frémont, and he generously supplied the

Pathfinder with men and money. This journey lasted from 1845 to 1847, and when Frémont and his party moved once again into California, Mexican authorities ordered them to leave. Frémont defied the order by raising an American flag and later joined with other migrants from the United States in instigating what became known as the BEAR FLAG REVOLT.

When war between the United States and Mexico was formally declared, Frémont helped to capture the California city of Los Angeles. However, he became involved in a serious dispute between two high-ranking members of the American military, Commodore ROBERT FIELD STOCKTON and General STEPHEN WATTS KEARNY, both of whom claimed authority over California. Frémont backed Stockton's bid for leadership, and the naval officer appointed him governor of California. As Frémont was technically still an officer in the army, an incensed Kearny, upon learning from Washington that he was in fact the one entitled to appoint the governor, detained Frémont and then marched him eastward to FORT LEAVENWORTH, where he was arrested. Frémont was found guilty by a military court of mutiny and disobedience. President Polk, grateful for the services he had rendered and aware of his great popularity, overturned the verdict, but Frémont was humiliated by the entire affair and resigned his commission.

The Pathfinder subsequently set out on a fourth expedition, this one financed not by the federal government but by his father-in-law and some businessmen in St. Louis. Once again his party included Kit Carson, but this expedition met with tragedy during the winter as they got lost in the Rocky Mountains of Colorado while searching for a railroad route. Ten of the party's 30 members died as a result, and some of the survivors blamed Frémont for the disaster. He later ended up back in California, where in the late 1840s gold was discovered on land he owned. Armed with this new wealth, Frémont was elected as the first U.S. senator from California; a Democrat, he served for less than a year due to a prior agreement.

In 1856 the new REPUBLICAN PARTY nominated the still well-known and popular Frémont as its first presidential candidate. A born southerner, he had come out in favor of antislavery forces in Kansas earlier that year, and this, combined with his heroic persona and colorful past, convinced Republicans that he would be a natural vote-getter despite his limited political experience. The Republican rallying cry in 1856 was "Free men, free soil, free labor and Frémont!" At 43, Frémont was then the youngest man in the country's history to be nominated for president. During the campaign, the DEMOCRATIC PARTY spread the false rumors that he was a secret Catholic.

Frémont was essentially a sectional candidate, as the Republicans were only on the ballot in four southern states,

John C. Frémont (Library of Congress)

all in the Upper South, and the party received virtually no votes in those states. There were thus two contests that year; Frémont vs. Democrat James Buchanan in the North and Buchanan vs. former President MILLARD FILLMORE, running on the American Party ticket, in the South. Frémont did very well in most parts of the North, winning 60 percent of the vote to Buchanan's 36 percent. He carried 11 states and won 114 electoral votes, but Buchanan won enough states in the lower North that, combined with his victory in the South, gave him a comfortable victory and the presidency.

During the Civil War, Frémont served unsuccessfully as a general, infuriating President Abraham Lincoln in 1861 by emancipating slaves in Missouri without authorization. In 1864 dissident Republicans dissatisfied with Lincoln's wartime leadership nominated him for the presidency, but Lincoln was able to persuade him to withdraw in return for a political favor. Although Frémont served as territorial governor of Arizona between 1878 and 1883, he depended on his wife's income from writing during his later years. He died in New York City in 1890.

### fugitive slave laws

Laws giving slaveholders the right to capture slaves who had escaped their bondage, as well as the enforcement of those laws, were at the center of much of the bitterness and growing divisions between North and South in the decade prior to the Civil War. The U.S. Constitution had given slave owners the legal right to capture runaway slaves and return them to servitude. Article IV, Section 2, stated that any “person held to service or labor in one state” who fled his or her bondage by going to another state “shall be delivered up on claim of the party to whom such service or labor shall be due.” This original language proved to be somewhat vague, and in 1793 Congress passed a measure, which became law, that gave slaveholders the right to actually bring those persons they claimed were their slaves into any local or federal court to prove ownership.

During the court proceedings that eventually stemmed from this law, those accused of being runaway slaves were denied trial by jury or the right to testify on their own behalf. Such a situation did not sit well with an increasing number of people in the North, especially as the ABOLITION MOVEMENT gained strength after 1830. Northern states therefore responded by passing a series of PERSONAL LIBERTY LAWS. The measures included protecting the rights of runaway slaves by providing criminal punishments for kidnapping and allowing those brought to court as fugitives to testify on their own behalf, have a jury trial, and not be imprisoned without due process of the law. Some of these laws were challenged in the courts, and in 1842 the U.S. Supreme Court handed down an important decision when it ruled that the 1793 Fugitive Slave Law was constitutional. The Court also ruled, however, that state governments were not required to enforce the language in the Constitution pertaining to fugitive slaves, as that responsibility rested with the federal government. This ruling paved the way for another series of state personal liberty laws in the North between 1842 and 1850, which denied the use of state government facilities and prohibited state officers from assisting those involved in the capture and extradition of runaway slaves. Among the states passing such laws were Massachusetts, Vermont, and Ohio in 1843; Connecticut in 1844; Pennsylvania in 1847; and Rhode Island in 1848. These measures drew a torrent of criticism from the South, with slaveholders denouncing the North for aiding abolition and encouraging lawlessness and disrespect for property. Although the exact number of slaves who made

their way to freedom in the North or to Canada remains in doubt, it is very possible that as many as several hundred enslaved people a year escaped their bondage along the route of the legendary Underground Railroad.

The question of fugitive slave laws remained a source of mutual hostility between North and South, and in 1850 Congress addressed the matter at the urging of southerners who wished to see the entire system of laws governing fugitive slaves strengthened to their advantage. The debate over the bill immediately broke down along sectional lines; predictably, southerners believed that the proposed measure did not do enough to protect their property, i.e., their slaves. Senators from the North complained that the proposed law did not give enough protection to free African Americans living in their states. The efforts of northern senators, mainly Whigs, to get amendments passed to the bill that would guarantee some rights to slaves were defeated. The Fugitive Slave Law was the only measure passed as part of the COMPROMISE OF 1850 that explicitly protected the rights of slaveholders. Consequently, it was the North that in general felt most aggrieved by it. Under the law’s provisions, a person could bring an accused runaway slave before a federal commissioner and provide “satisfactory proof” of ownership, either by testimony of witnesses (whites only) or documentation from a court in a southern state. The law also included penalties for those, including federal officials, who aided or abetted runaway slaves or who refused to assist in their capture and extradition.

In practice, the enforcement of the 1850 law favored slaveholders at the expense of African Americans. During the decade after its passage, over 300 persons accused of being runaway slaves were forced to return to bondage, while only 11 were allowed to remain free. Tragically, some of those who were sent south against their will had been previously free. Abolitionists refused to accept the law as it was written, however. A crowd in Boston stormed a federal courthouse in 1851 and rescued a runaway slave named Shadrach Minkins, who was facing certain return to the South. Three years later, also in Boston, federal officials responded with force of their own when hundreds of deputies and soldiers escorted runaway slave ANTHONY BURNS to a ship waiting to return him to his owner.

Opponents of slavery challenged the law in the courts, but in 1859 the Supreme Court ruled that it was constitutional. Even so, opposition to the law helped to drive many Whigs and some Democrats who opposed slavery out of their parties and led them to create a new one, the REPUBLICAN PARTY. Southerners increasingly took the stance that strict enforcement of the Fugitive Slave Law was necessary for them to stay in the Union. As a result of some highly publicized cases in which runaway slaves were forcibly returned to the South under the provisions of the 1850 law, northern states from New England to the Middle

West passed yet another series of personal liberty laws in the 1850s. Ultimately, it was the controversy over slavery in the Kansas and Nebraska Territories and the election of Republican Abraham Lincoln to the presidency in 1860 that led to the outbreak of the Civil War (1861–65). Even so, the intense disagreement over whether slaveholders had the right to capture runaway slaves and return them to the South from anywhere in the United States illustrated as much as anything that the slavery question was causing an unbridgeable gulf between North and South. During the Civil War, the Republican-dominated Congress revoked the Fugitive Slave Law of 1850.

**Fuller, Margaret** (1810–1850) *author, women's rights advocate*

Born on May 23, 1810, in Cambridgeport, Massachusetts, Sarah Margaret Fuller went on to become one of the foremost American philosophers, feminists, and social critics of the 19th century. The eldest child of Margaret Crane Fuller and Timothy Fuller, Margaret received a classical education from an early age. Save for two years spent at the Misses Prescott's school in Groton, Connecticut, from 1824 to 1826, she was educated entirely by her father, a lawyer and U.S. congressman. By the age of seven, she was reading Ovid, Virgil, and Horace, and by adulthood she was proficient in French, German, Italian, Latin, and Greek. A formidable scholar, Fuller applied for and gained access to the libraries at Harvard University, a male-only institution.

In the mid-1830s, Fuller met RALPH WALDO EMERSON and became increasingly devoted to the philosophy of transcendentalism. She befriended many other New England intellectuals including Elizabeth Peabody, W. E. Channing, and Bronson Alcott, father of Louisa May. In December 1836, she became a teacher at Alcott's Temple School in Boston, before moving to Providence, Rhode Island, where she taught until 1839. That year she returned to Boston and founded a weekly group for women to discuss matters of art, philosophy, mythology, and women's rights. These 'conversations,' as the meetings were called, took place until 1844. Fuller concurrently deepened her commitment to the TRANSCENDENTAL MOVEMENT, helping to plan the utopian community of BROOK FARM in 1841 and cofounding *The Dial*, a quarterly journal, with Emerson and George Ripley in 1840. As editor of the journal from 1840 to 1842, and as contributor until its demise

in 1844, Fuller was one of its most ardent supporters. In 1843, she published "The Great Lawsuit: Man *versus* Men. Woman *versus* Women," in *The Dial's* pages, an essay that she would revise and expand to publish as *Woman in the Nineteenth Century* in 1845. Both works sharply criticized the inequality between men and women in 19th-century America, particularly in terms of education and legal rights. *Woman in the Nineteenth Century* is believed to have been a major influence on the organizers and participants at the women's rights convention of 1848 in SENECA FALLS.

In 1844 Fuller published *Summer on the Lakes*, a travel journal that contained her thoughts on America's westward expansion and included commentary on the education of women. Impressed by her literary skills, Horace Greeley hired Fuller as a critic for the *New York Tribune* in 1845. While she lived in New York for only a year, it was a year that compounded her commitment to social activism, particularly in support of abolitionism, prison reform, and women's rights. In 1846, she left New York to become the *Tribune's* foreign correspondent, visiting England and France to meet with numerous writers and politicians. Eventually she settled in Rome, where she became an increasingly active participant in the revolutionary campaign to unify Italy. There she met Giovanni Angelo, Marchesse d'Ossoli, a fellow revolutionary with whom she conceived a son, born in 1848. Sometime in the next two years, Fuller and d'Ossoli were married, but not, to the chagrin of many of Fuller's compatriots, until after the birth of their son. In 1849 the revolution was defeated, and the d'Ossolis fled Rome. Hoping for a new beginning and, some suggest, in spite of a nagging feeling of impending disaster, the d'Ossolis boarded the ship *Elizabeth*, bound for New York in 1850. A mile from the shores of Fire Island, New York, the ship ran aground and sank. Only the body of Eugene, the d'Ossolis' son, was ever found.

## fur trade

From the beginning of European contact with North America, the fur trade drew entrepreneurs who hoped to tap its lucrative potential. For three centuries, the fur business shaped the international economy, Indian-white relations, and the American landscape and settlement patterns. As European colonization in North America moved west from the Atlantic Ocean and east from the Pacific,

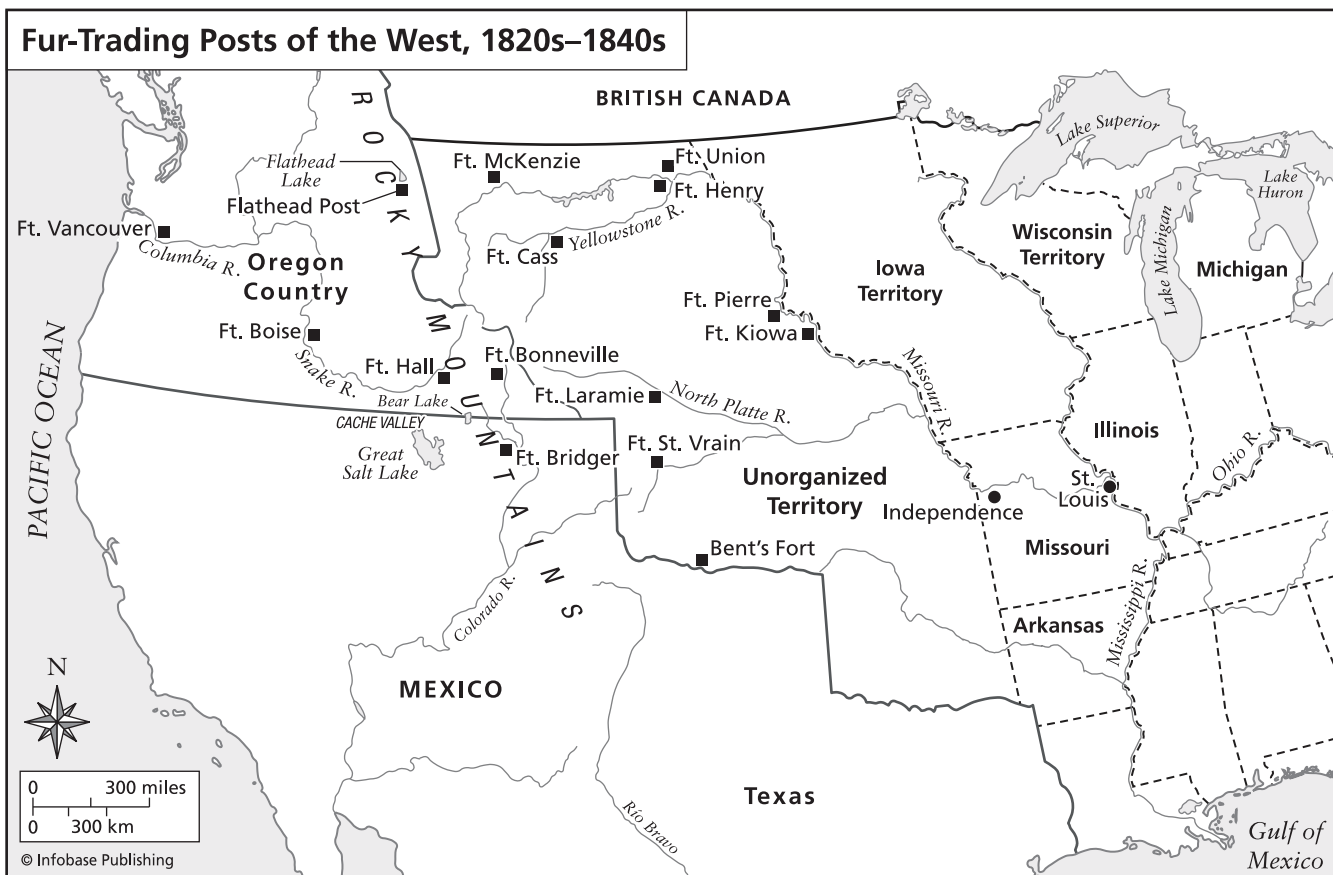

trappers and traders traveled with explorers, continuously expanding into new territories possessing new sources of fur. Much of the diplomatic and economic relationship between Native Americans and Europeans depended initially on the trade in beaver pelts in the Northeast, deer in the Southeast, sea otters along the Northwest Pacific coast, and bear in the Rocky Mountains. These furs were in high demand in Europe for manufactures such as coats and felt hats.

Of the commodities Europeans found in North America, fur was the easiest to acquire and sell for immediate profit. Both officially government-sanctioned companies and private individuals competed for trading rights, which were contested among the European nations then involved in international trade and colonization: Spain, France, Great Britain, Russia, and Holland. Each of these countries developed trading agreements with different groups of NATIVE AMERICANS, often using existing animosities among Indian nations to strengthen their own trading alliances. Cooperation with Indians was absolutely necessary, since they understood the American terrain and how to hunt most effectively for beaver and other valuable fur

producers. Initially, Indian men hunted, and Indian women prepared the pelts for trade. Then middlemen or certain tribes would trade these pelts for items produced in Europe such as tinware, tools, textiles, and liquor.

In the early years, non-Indian hunters stayed clear of activities that would compete with Indian hunting, preferring to act only as traders. This arrangement, however, did not last, and the trading networks that had been established between whites and Indians were disrupted by competition among different nations and their European allies. These changes led to the disastrous Iroquois wars of the 17th century, in which the Iroquois and their trading allies from England and Holland decimated the Huron, the major intermediaries in the inland fur trade and key allies of France.

After these conflicts, English and French trading interests continued to clash, especially in northern Canada and the Great Lakes region. By sending missionaries, traders, and explorers inland and establishing successful trading posts at Montreal and Detroit, the French successfully expanded their trading power. English influence also grew with the establishment of the Hudson's Bay Company in

1670. While the French strategy for capitalizing on North American trade was to mingle with Native Americans and promote political as well as economical allegiances between the royal France and its American subjects, the aims of the English trading companies were more driven by private profit and economic power. French and English animosities continued to grow, eventually leading to the French and Indian War, or Seven Years' War, which ended in 1763 with the fall of New France. Old French trading companies in Montreal continued to compete privately with the Hudson's Bay Company by forming the new North West Company. These two firms continued to contend for new trade among Indians from the Great Lakes all the way to the Pacific Ocean, finally merging their operations in 1821.

During the first half of the 19th century, the American fur trade was dominated by the AMERICAN FUR COMPANY and other powerful trading organizations such those run by the CHOUTEAU FAMILY and Manuel Lisa. Because extensive settlement in the eastern United States before and after the Revolutionary War had eradicated the fur-producing animals from that region, traders needed to expand to the interior and find new sources of fur. After the Lewis and Clark Expedition (1804–06) mapped potential trade routes through the trans-Mississippi West, this vast territory and its fur resources were easier for traders to exploit. In 1822, WILLIAM HENRY ASHLEY's expeditions explored and discovered routes for travel across the Rocky Mountains and the Continental Divide, which opened up this region to transcontinental trade. The various branches of JOHN JACOB ASTOR's American Fur Company dominated the American market from 1808 to the mid-1840s, establishing trading posts from St. Louis to Oregon. Beginning in 1810, St. Louis was the market center of the western fur trade for three decades.

By the beginning of the 19th century, it was clear that the fur trade and its subsequent industries had transformed Indian economies and ways of living, leading Native Americans to primarily supply pelts while relying on trade for goods they had once produced for themselves and for new goods they wanted, such as kettles, guns, and blankets. In a larger sense, the fur trade transformed Indian ideas about how to live with the world, giving monetary value to things that were previously not commercial in their cultures. Until the abolition of the Indian factory system in 1822, Native-American groups could compete with the fur companies and maintain some level of economic power in the production of fur goods. The Indian factory system consisted of U.S. government-owned and -operated fur trading posts, whose policies of fair prices and no alcohol were designed as a model of fur trading posts. After the factory system was eliminated

by the federal government (at the strong urging of its competitor, Astor), Indians became more dependent for their trading livelihood on white traders and white companies. Native Americans had participated willingly in the fur trade, drawn to the prospect of materially improving their lives just as white Europeans were doing. But over time, Indian participation in the American market economy became less negotiated and more coerced. From the beginning, the fur trade introduced Native Americans to an international capitalist economy—one that would eventually contribute to the depletion of their resources and their eviction from valuable lands. As their lands were taken and the finite resources (such as fur) that they depended on for economic agency diminished, Indians were increasingly forced into debt with white traders in order to survive.

The fur trade altered Native-American cultures permanently. Social interactions and family relationships changed as the older customs gave way to new practices that disrupted old roles. The economic imperative to process more and more pelts meant that older limits imposed on hunting were discarded, which led to over-hunting and the destruction of the food chain in many areas. As beaver and other desirable fur-bearers declined in number, Indians and white traders relocated to fresh hunting grounds, and the process was repeated. Disease spread from European traders to Indians along trade routes. Because Native Americans had not developed immunity to European diseases such as smallpox and measles, the death toll could be devastatingly high, destroying whole villages and tribes. The ravages of disease and the destruction of North American ecosystems followed in the wake of traders and settlers as they penetrated further into the continent in search of furs and other commodities.

The fur trade eventually dwindled in importance due to the depletion of available pelts and changes in European fashions and market demands. In North America, the major fur companies were finished by the 1870s. But the lure of fur as a quick moneymaker continued. Despite the breakdown of trading companies and reciprocal trade relationships, the fur trade continued with the availability of a new product: bison. As the Plains Indians were cleared from their lands by settling Europeans after the Civil War, companies and individuals hunted the Plains bison nearly to extinction. Even without the powerful fur companies or Indian trading partners, American and foreign entrepreneurs were still drawn to harvest the abundant fur in America, and continued to threaten the future of the ecosystem.

### Gadsden Purchase

The Gadsden Purchase was, in essence, a diplomatic follow-up to the MEXICAN-AMERICAN WAR, which was brought to a formal conclusion by the TREATY OF GUADALUPE HIDALGO in 1848. In the years immediately after the end of the war, Mexico accused the United States of not fulfilling some of its obligations under the treaty, including protecting Mexico from incursions of American Indians who lived in the United States. There was also a boundary dispute between the two nations over land south of the Gila River. This territory had not been sufficiently surveyed to reflect the boundaries agreed to in the treaty. These lands in Mexico also included important low mountain passes that American investors looking to build a southern railroad from New Orleans to the Pacific Ocean sought to acquire. In addition, two American speculators, P. A. Hargous of New York City and A. G. Sloo had purchased tracts of land in the disputed territory and demanded that the United States protect their property in Mexico.

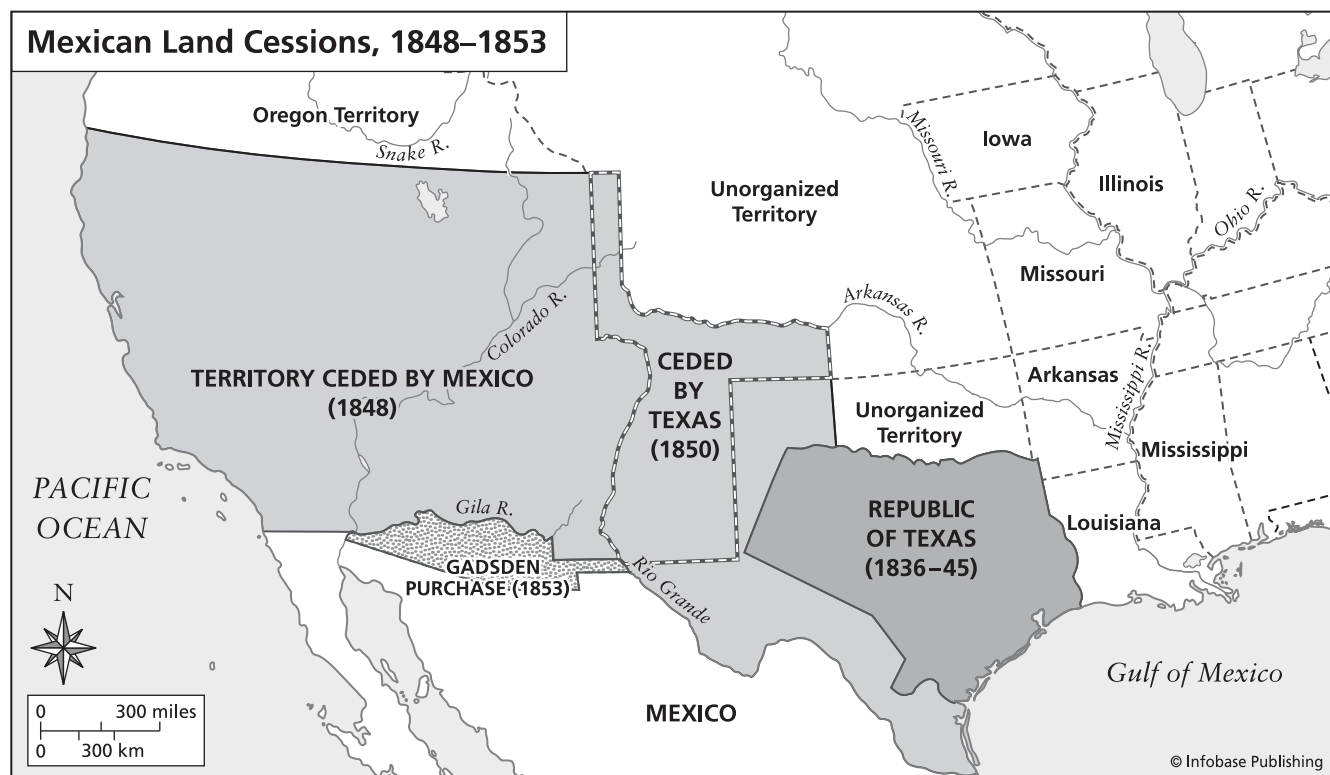

In 1853 President Franklin A. Pierce, a Democrat and leader of a party favoring westward expansion, appointed James Gadsden, a native of South Carolina, as minister to Mexico. Secretary of War Jefferson Davis, a friend of Gadsden who also favored the building of a southern railroad, was instrumental in the appointment. The grandson of Christopher Gadsden, a leader of the American Revolution in South Carolina, James Gadsden was a railroad promoter who in 1840 was elected as president of the Louisville, Cincinnati and Charleston Railroad and later successfully managed the South Carolina Railroad, the most extensive railroad in the southern United States. Gadsden had been less successful in politics, having failed on several occasions to win election to Congress as delegate from the Florida Territory. He had earlier served as an officer under General ANDREW JACKSON in the First Seminole War in Florida.

At the time of his appointment as minister to Mexico, Gadsden had a financial interest in the disputed territory. Pierce instructed him to arrange a purchase of the land

in question from Mexico. The original hope of the Pierce administration was to acquire lower CALIFORNIA as well, which belonged to Mexico. However, there were many in Congress, especially those from the northern states staunchly opposed to the expansion of SLAVERY, who were wary of Gadsden, suspecting him of seeking the land in order to create more slave states. This was a reasonable assumption, because as early as 1850 he favored not only the extension of slavery and the construction of a southern railroad, but, if need be, the South's secession from the United States to protect its rights.

After arriving in Mexico City, Gadsden offered Mexican president ANTONIO LÓPEZ DE SANTA ANNA \$50 million for about 250,000 square miles in the northern part of the country. That square mileage represented nearly one-third of Mexico's entire territory. Since his country needed the money badly, Santa Anna agreed to a treaty with the United States by which he would sell 55,000 square miles for \$15 million. Opposition to the treaty persisted in the Senate, and a contentious debate ensued that contributed to the growing sectional tension between North and South. Supporters of the proposed treaty were also hampered by the flagrant lobbying of speculators looking to enrich themselves, and there was opposition in the Senate to providing Santa Anna, a hated figure to many Americans dating back to the attack he led on THE ALAMO in 1836, with such a large sum of American money.

The Senate narrowly approved the treaty on April 25, 1854, but only after cutting 9,000 square miles and \$5 million from the original agreement that Gadsden had reached with the Mexican government. Reflecting the fears over the expansion of slavery, it also reduced the territory that the United States stood to acquire to only that land deemed necessary for the railroad route. The Gadsden Purchase benefited the United States much more than it did Mexico. The year after the treaty was signed, Santa Anna was overthrown, the Gadsden treaty being a contributing factor in his demise. Railroad interests in the United States

subsequently succeeded in building a line through the territory acquired from Mexico as part of the Southern Pacific Railroad in the 1870s and 1880s.

**Garnet, Henry Highland** (1815–1882) *minister, abolitionist*

Henry Highland Garnet was an important African-American abolitionist. Born a slave in New Market, Maryland, on December 23, 1815, the young Garnet escaped with his family to Wilmington, Delaware. He was educated at the African Free School in New York City, then served as a cabin boy beginning in 1828. After an accident cost him the use of his right leg, Garnet resumed his studies at the Noyes Academy in Canaan, New Hampshire, until the school was destroyed by a white mob in 1834. Undaunted, Garnet finished his education at the Beriah Green Oneida Institute.

In 1841 Garnet was ordained minister for the Liberty Street Presbyterian Church in Troy, New York. Here he turned his church into a hotbed of abolitionist and black

self-help ideology, as well as an important station on the underground railroad to Canada. It was in this capacity that Garnet gained notoriety in abolitionist circles for his “Address to the Slaves of the United States of America,” delivered at the National Negro Convention in Buffalo, New York, in 1843. In this speech Garnet urged those held in bondage to use whatever means necessary to throw off their chains, although he carefully couched his militancy in biblical terms. Moderates like Frederick Douglass interpreted Garnet’s directive as an appeal to a slave uprising, and Douglass successfully opposed having the speech distributed to convention attendees. Garnet, however, reintroduced the speech at a convention in Troy four years later, when it was published and distributed. By this time Douglass was no longer allied to the moderate Garrisonians and spoke publicly in favor of a slave uprising.

In 1850 Garnet traveled to England to lecture and preach on behalf of a national boycott of goods made by slave labor. Three years later he settled in Jamaica as a missionary. Illness necessitated his return to the United States in 1856, where he preached in New York City and Washington, D.C. Garnet actively recruited African-American soldiers throughout the Civil War, and in February 1865 he became the first black to deliver a memorial sermon in the U.S. House of Representatives. Garnet spent the remainder of his life working on behalf of civil rights. He continually railed against the failures of Reconstruction. He

was also active in encouraging black emigration to Africa. In 1881 President James Garfield appointed Garnet minister to LIBERIA, where he died of illness on February 13, 1882. He is remembered as one of the earliest proponents of black nationalism in America.

### ***Genius of Universal Emancipation* (1821–35)**

This antislavery periodical was started in 1821 by Benjamin Lundy (1789–1839) in Mount Pleasant, Ohio. While not the first serial publication to advocate the abolition of SLAVERY, the *Genius of Universal Emancipation* was the first to be entirely devoted to the abolitionist cause. Previous newspapers such as the *Emancipator* and the *Philanthropist* considered other reform issues in addition to slavery, and were addressed primarily to the Quaker community. A Quaker himself, Lundy realized the limited usefulness of addressing only fellow Quakers. After witnessing the failure of abolitionists to influence policy during the Missouri controversy of 1820, he began to think that a more effective way to force changes in the slave system would be to use his newspaper to galvanize the general public about the evils of slavery.

Soon after the periodical's beginning, Lundy moved his operation to Jonesborough, Tennessee, publishing his antislavery views from within a slave state. For most of the 1820s, the *Genius* was the only newspaper in the United States focusing exclusively on the slavery question. Lundy's efforts attracted the anger of the opposition, and he was threatened with physical harm several times. The newspaper, however, continued to grow in circulation and influence. Tireless in his efforts, Lundy traveled widely, spreading the word about abolition and the *Genius*. He later moved its operations to Baltimore, while continuing in his attempt to build a nationwide antislavery movement with the political clout necessary to challenge proslavery interests. He organized antislavery societies in New England with the help of clergymen and abolitionist William Lloyd Garrison, whom he convinced to embrace slavery as the crucial reform issue. Garrison coedited the newspaper with Lundy after 1829.

With a combination of zeal and practicality, the *Genius of Universal Emancipation* advocated the end of slavery by various possible means. Lundy at first considered the efforts of the AMERICAN COLONIZATION SOCIETY to be legitimate but later repudiated the proslavery elements of the movement. Open to any ideas that would undermine the slave system, he also advocated gradual emancipation

through political means and the inclusion of former slaves into American society. While based on many of the moral appeals that characterized the later ABOLITION MOVEMENT, Lundy was also interested in undermining slavery politically by creating a groundswell of voter opposition through the *Genius*. His newspaper continued to be published in various incarnations until his death in 1839.

### **Ghent, Treaty of (1814)**

The Treaty of Ghent between the United States and Great Britain ended the WAR OF 1812 by restoring the status quo antebellum. On the one hand, that result disappointed many Americans who believed the country had important grievances against the British. On the other hand, since the war had been a near-disaster for the United States, a treaty that effectively declared the war a draw was a better result than might have been expected. Further, following the Treaty of Ghent, the British withdrew their support for the Native American nations in the U.S.-held Great Lakes territories. Removal of this support made the Great Lakes region—the Old Northwest—more open for non-Indian settlement.

War engulfed Europe in the early 19th century. On the fringes of this struggle, the United States tried to assert its neutrality and its right to trade with both sides in the European conflict. This failed as the European combatants, primarily the British and the French, each tried to block the other's trade with the United States. The British went further, however, boarding American ships on the high seas and impressing (removing) any sailors who either had been members of the British navy or were former British subjects; the latter category included many American citizens, since the nation had gained its independence from England as recently as 1783. In one incident, aboard the USS *Chesapeake*, American citizens were killed as alleged deserters from the British navy. The United States also accused the British of encouraging Native Americans to resist U.S. authority and to attack settlers in the Great Lakes region. Each of these grievances—interference with trading rights, impressment, the *Chesapeake* incident, and the problems with the Native Americans—was featured in President James Madison's war message to Congress in 1812.

Interestingly, although the United States had declared war on England, the nation did not become an ally of France but chose instead to enter and fight the war alone.

It was almost a fatal mistake. The Americans wrongly believed that they could easily conquer Canada; indeed, they expected the Canadians to welcome incorporation into the American nation. Instead, the Canadians fought successfully against the American invasion, though American forces did burn the Canadian capital city. The most notable American military successes before the end of the war came in naval battles on the Great Lakes and HARRISON's defeat of the Native Americans led by Tecumseh at the BATTLE OF THE THAMES. By summer 1814, Napoleon's France had been defeated in Europe, and the British had turned their full attention to the war in North America. They tightened their blockade of the U.S. coast and invaded the Chesapeake area, capturing Washington, D.C., and burning the Capitol building and the president's residence. Both sides were ready for peace, however, and in December 1814, negotiators concluded the Treaty of Ghent. Two weeks later (because of poor communications), the last battle of the War of 1812 occurred at New Orleans, where ANDREW JACKSON repelled a British invasion force.

In fact, like the BATTLE OF NEW ORLEANS, the war itself was perhaps unnecessary. Shortly after the American declaration of war, the British repealed their Parliamentary acts that had interfered with American trade, a change brought about by a depression and a change of government. Meanwhile, the war was deeply unpopular in certain parts of the United States, especially in New England, where merchants continued to trade with the British, and at the HARTFORD CONVENTION, Connecticut hinted at the possible secession of New England from the Union. Under such circumstances, it is not surprising that negotiations to end the war started soon after it began; the two countries even maintained diplomatic relations throughout the war.

The war's ebb and flow directly affected the negotiations. Early on, the Americans demanded that a peace treaty redress all their grievances involving trade, neutral rights, and especially impressment. By 1814, American negotiators had dropped the impressment issue and sought a treaty which merely restored the status quo antebellum. By then, however, the British were demanding more: territorial concessions in Maine, northern New York State, and the northern part of the future state of Minnesota; and an independent Native-American state in the Great Lakes region as a buffer between the United States and Canada. War weariness and the still-volatile situation in Europe soon led the British to drop their most extreme demands and accept the American idea of status quo antebellum.

For the United States, the Treaty of Ghent had advantages. The end of war in Europe—temporary, as it turned out—had removed the causes for interference with neutral trading rights and impressment. The treaty also restored to the United States the territories the British had occupied

during the war. Further, it demilitarized the Great Lakes and established a lasting peace between the United States and the British in North America and in the world, laying the groundwork for later Anglo-American friendship. Finally, British abandonment of their Indian allies in the treaty, combined with the death of Tecumseh in 1813 and the consequent collapse of his dreams for an Indian confederation in the Old Northwest, largely ended the Native-American threat to white settlement in the Great Lakes region.

Though the United States failed in its primary objective of adding Canada to the Union, the Treaty of Ghent confirmed certain gains made during the War of 1812. In particular, American nationalism had been enhanced. New England sectionalists failed to disrupt the Union, and important symbols of American patriotism emerged from the war, including the "Star Spangled Banner" (written as FRANCIS SCOTT KEY watched the British bombard but fail to invade Baltimore), "Uncle Sam" (a character based on a real person who helped get supplies to American troops), and the White House (painted to cover smoke damage from the fire that had burned it).

## gold, discovery and mining

The first important gold mining within the United States took place in the states of North Carolina and Georgia in the 1820s and 1830s. While they camped on the rushing streams of the Appalachian Mountains, this first generation of American miners panned and washed for gold (a process called placer mining). In the years 1828, 1829, and 1830, placer gold discoveries in Georgia drew a crowd of prospective miners. Gold production in Georgia reached \$110,000 in 1828, a dramatic amount for the age, which would within a generation be dwarfed by events in CALIFORNIA.

The important gold discoveries were those connected with California at mid-century. On January 24, 1848, James W. Marshall, employed by the entrepreneur JOHN SUTTER to construct a sawmill on the American River, picked some mineral flakes out of the tailrace. He identified these specimens as gold, and later primitive tests confirmed his view. Marshall's gold discovery began a series of events that would change the history of California and the history of mining, by bringing the discovery and mining of gold to the

Daguerreotype by R. H. Vance of James Marshall at Sutter's sawmill, Coloma, California, where he discovered gold (*Library of Congress*)

center of events associated with the American West. These influences would last for the rest of the century.

From the first news of its discovery, gold production in California was large and it grew for the next few years, before stabilizing for the rest of the decade. In the first six years from 1849 to 1855, the argonauts (as they were sometimes called) harvested some \$300 million in gold from California.

Gold mining was important to Americans everywhere at mid-century because of the nature of the enterprise. From the beginning of mining in California in spring 1848, the gold was available to everyone, regardless of wealth and technical skill, and it was an enterprise that rewarded hard work, without need for capital investment—or so it initially seemed. New arrivals in the goldfields could learn the rudiments of mining in 15 minutes. Anyone with a pick, pan,

and shovel could become a gold miner, and in 1848, 1849, and even 1850, a miner could expect to make unheard-of sums. Indeed, ordinary miners expected to make from \$15 to \$20 a day, at a time when the normal wage for agricultural laborers was \$1 a day. It is no wonder that so many FORTY-NINERS headed west to the Golden State to participate in this bonanza.

From the beginning, miners worked in groups called “mining companies.” As early as the summer and fall of 1848, the first arrivals in the goldfields immediately understood the advantages of working in clusters of at least three or four; most companies settled on six to eight. By the mining season of 1849, the “mining company” was everywhere in the goldfields.

Whatever the organization, the basic unit of work in the CALIFORNIA GOLD RUSH—at least for the first

half-dozen years—was the human body. The hard, repetitive labor of digging, carrying, and washing was often done in swift, ice-cold, moving water. Contrasting with the icy water of the snowmelt watercourses was the heat of the summer California sun, beating down on the bars and into the still canyons. The work was exhausting, and during the long workdays that stretched into a long mining season, Forty-niners drove themselves forward on a daily basis through a combination of restless energy, hope, self-interest, and group loyalty. The mining companies carried over to living arrangements. For the Forty-niners, it was cheaper and more efficient to live and work in groups. From five to eight men would occupy a large tent or cabin as close to the work site as possible, where they would take turns cooking, cleaning, and making trips to the larger camps for food and mail.

The act of mining in California in the middle of the 19th century was straightforward. Gold was found in the nooks and crannies of old streambeds and in the bottoms of existing watercourses, where it had been left during thousands of years by moving water carrying the mineral downstream until the flow was insufficient to support the weight. Thus, water was a crucial agent in early gold mining, as an instrument in transporting and dropping the mineral, and as a force for its separation from the dirt around it. The first American miners—often tutored by early-arriving Mexicans—quickly mastered the primitive techniques by which moving water flowing through a tin container would separate the gravel carried off by the force of the flow of water from the heavier gold particles, which would sink to the bottom of the pan, where they could be easily retrieved and stored in a small sack. The widespread presence of gold in the streams draining the western slope of the Sierra Nevada and in gold streambeds—where it might be uncovered by removing a layer of top soil—meant an accessibility that made the early gold rush an exercise open to everyone. All that was necessary to participate were the most elementary and easily available tools.

Furthermore, the search for gold was uninhibited by institutional influences. Access to the rivers, streams, and valleys was open, and no licenses were issued by any kind of central authority (although the state of California levied a tax on alien miners in 1850). The issue of land ownership was in abeyance, since the land was sparsely settled and largely unclaimed in a European sense (except for the tracts belonging to John Sutter). The California Indians were sufficiently weakened by two generations of the mission experience and the trauma associated with its destruction to offer little or no resistance, although this did not prevent American miners and politicians from waging an undeclared war against California's NATIVE AMERICANS.

As mining became more crowded—the number of miners in the goldfields grew from 50,000 in 1849 to 100,000 in 1850 to 125,000 in 1851—the Americans felt a rising hostility toward other national groups. The issue began as a struggle over attractive mining claims and the xenophobic argument that the mines were for Americans alone. The initial targets were the Mexicans, followed by the Chileans and the French. This animosity toward foreigners reached a climax with attacks on the Chinese—who came in large numbers after 1851—the group most different by appearance and culture. Anti-Chinese riots became a focus of politics in San Francisco over the last half of the 19th century.

Advances in technology quickly changed the nature of mining. The first new machine was the “rocker” or “cradle” earlier in use in the gold mines of Georgia and North Carolina. The cradle was a rectangular box six or eight feet long, open at the foot, with a coarse grate and sieve at its head and small cleats nailed across a rounded bottom. The principle was the same as before—namely, to let the water do the work of separating the gold from the gravel. The difference was the economy and efficiency provided by a machine that would allow men to pool their labor into larger units. The pan and the cradle—simple to purchase or easy to make from boards of lumber and both relying on the washing action of the water—provided the technology for the first two years of the California gold rush. Most companies operated one or more “cradles.” The universality of both instruments, in spite of rising prices in accordance with supply and demand, ensured that every prospective argonaut could have access to the latest technology in the goldfields.

Mining was changing in other ways, too. By the close of 1849, some miners had banded together to construct dams to divert streambeds for washing. Mercury to separate the gold particles from gravels was rapidly introduced, and by the beginning of 1851, miners had begun what they called quartz mining: the retrieval of gold-bearing rock from deep shafts, the crushing of these gravels, and their processing to capture the gold. River damming, hydraulic mining, and quartz mining gradually transformed or at least severely restricted the opportunities of individuals in opposition to large-scale companies with substantial capital that soon sold shares to the public. Larger units of production with new techniques had replaced simple placer mining, and individuals had become parts of larger companies, with increased investment in season-long mining enterprises. The expanded opportunities for gold recovery were associated with the concentrations of capital and increasingly the sale of shares to the public. Capitalists (or even individuals of modest means) could invest in distant gold-mining enterprises or water companies (almost as profitable as gold) without leaving the comfort of their homes in San Francisco.

It is impossible to overestimate the significance of the California gold rush for mining in the American West. The 10 years of the rush would produce an explosive immigration to the goldfields; transform California into an American state; and establish the basic institutional forms for mining (that would later be codified in the Mining Law of 1872), especially the principle that mining was to proceed without interference from the federal government. It would also serve as a laboratory for the development of mining technology for the next half-century, especially as an introduction to the COMSTOCK LODE, where so many of these technical skills were perfected. Finally, the rush introduced the large-scale forms that would transform mining from an individual into a corporate enterprise, with a large labor force, sophisticated technology, and large capital investment, including absentee ownership and investment. California also proved that in the face of mining strikes, neither well-meaning individuals nor governments at any level could protect the rights of Native Americans from rapacious prospectors, and the California experience outlined a future in which foreign miners (especially non-English speakers) would be subject to discrimination and harassment. California was also the site of the first struggles over mining and the environment.

The gold strikes in California in 1848 and over the next decade generated an ever-widening search for gold throughout the West. Among the most significant of the new discoveries was that associated with the Comstock Lode, which a decade later would become a great silver-producing complex in the future Nevada Territory.

The more immediate gold discoveries that followed the pattern of the rush to California took place in Colorado. The COLORADO GOLD RUSH began in 1857, with strikes along the Platte River close to the present site of Denver, and spread into the mountains in subsequent months. Soon news of the gold finds spread east and west, ushering in a great movement of gold seekers to Colorado in the summer of 1858. Most of these prospective miners came from the East, and they crossed the plains in companies (like their California counterparts a decade earlier) to the village of Denver, from where they moved into the mountains. The Colorado gold rush showed many of the same characteristics as the original rush to California, but in Colorado the actual discoveries were less rich and numerous. For the rest of the century, the California gold rush was the standard by which other gold strikes around the world would be judged.

**Further reading:** Paula Mitchell Marks, *Precious Dust: The American Gold Rush Era, 1848–1900* (New York: William Morrow, 1994); Rodman W. Paul, *Mining Frontiers of the Far West, 1848–1880* (Albuquerque: University of New Mexico Press, 1963).

**Gregg, Josiah** (1806–1850) *historian, trader, explorer*  
The pioneer historian Josiah Gregg was born in Overton County, Tennessee, on July 19, 1806, and he relocated to Missouri with his parents at an early age. He later settled in Independence, Missouri, where he studied mathematics, surveying, medicine, and law. In 1831 poor health compelled him to move to the frontier to recuperate, and he joined a wagon train headed for Santa Fe, New Mexico.

The trip proved beneficial. Having studied Spanish en route, Gregg began working as a trader in the Mexican state. Over the next nine years he made the wagon trip seven more times, all the while recording his observations and experiences in painstaking detail. In 1844 Gregg published these writings as a two-volume set entitled *Commerce of the Prairies*. This memoir provided interesting passages of prairie travel for the entire length of the 800-mile trek, along with observations of Mexican life and culture, which he regarded as degenerate. Gregg's was one of the first and best-written accounts of the early western frontier, and it became enormously popular. It was reprinted five times over the ensuing decade, including three editions in German, and it sparked considerable economic interest and migration to that region.

In 1846 Gregg enthusiastically supported the war against Mexico. He rode 1,200 miles to San Antonio, Texas, to join General William J. Worth's army as a member of the Arkansas Volunteers. In this capacity he wrote several accounts of the Battle of Buena Vista for the newspapers before briefly settling in Saltillo, Mexico, to practice medicine. Gregg soon joined an expedition seeking an overland trail to Northern CALIFORNIA, which finally reached Humboldt Bay in December 1849. He next commanded a party of seven men across the Coast Range of the Pacific on the return leg of the voyage. On February 25, 1850, greatly weakened by hunger and exposure, he died of injuries from a fall off his horse. Gregg is regarded as one of the best of the early western historians, and his rendition of the SANTA FE TRAIL remains a classic of frontier literature.

**Grimké, Angelina** (1805–1879), and **Grimké, Sarah** (1792–1873) *abolitionists*

The children of wealthy planters, Sarah and Angelina Grimké worked the greater part of their lives to abolish the institution of SLAVERY that surrounded them from birth. Born to Mary Smith Grimké and John Faucheraud

Grimké—Sarah on November 26, 1792, and Angelina on February 20, 1805—the sisters were raised on a plantation in Charleston, South Carolina. There they received an education considered fitting for young southern women, consisting mostly of basic literacy and social arts. In addition, the sisters attended the law classes that their father, a legislator and judge, held for his sons. Perhaps the most lasting EDUCATION they received in the South, however, was on the cruelties of slavery. Both Grimké sisters grew to hate the institution that supported them.

In 1816, Sarah Grimké traveled with her father to Philadelphia, where the latter hoped to find treatment for his continued ill health. It was there that Sarah first came into contact with Quakers and became increasingly impressed by their simple lifestyle and opposition to holding slaves. When John Grimké died in 1821, Sarah moved to Philadelphia and joined the Society of Friends, immersing herself in Biblical studies. Angelina Grimké followed her sister to Philadelphia in 1829 and quickly joined the Philadelphia Female Anti-Slavery Society. Over the next six years, the sisters became regular attendees at antislavery meetings. In 1835, Angelina Grimké wrote a letter of support to William Lloyd Garrison, editor of the abolitionist newspaper *The Liberator*. When Garrison printed her letter, the Grimké's public life had begun.

Joined in their commitment to abolitionism, the Grimké sisters nevertheless had their own particular strengths. Angelina began the sisters' public attacks on the institution of slavery with her 1836 pamphlet *An Appeal to the Christian Women of the South*. In it she urged southern women to embrace the political nature of their roles as mothers, wives, and daughters. While the formal avenues of power were closed to women—they could not vote and they could not run for elected office—they were ideally disposed, she argued, to influence the hearts and minds of the men who did. “[I]f you really suppose *you* can do nothing to overthrow slavery, you are greatly mistaken,” she wrote. Her ideas caused outrage across the South, and pamphlets sent to her hometown were burned by the postmaster before they could be distributed. Sarah, meanwhile, used her biblical training to write *An Epistle to the Clergy of the Southern States*, published in the same year. In it she flatly denied that there was any scriptural defense for slavery. The sisters followed up their publications with lectures, first in private homes and then at public meetings, attended by men and women alike.

Opposition to the Grimké sisters' work was varied and strong. In the South, the sisters were reviled for their abolitionist opinions and warned never to return to South Carolina. In the North, however, their public speaking engagements were considered by many to be improper. It

was rare for women to speak in public, and even more so for them to address mixed crowds. The collective clergy of Massachusetts were so disturbed by the Grimké's public appearances that in 1837 they issued a pastoral letter condemning the sisters. Women, they argued, were weak and dependent, their “appropriate duties and influence . . . clearly stated in the New Testament. . . . But when a woman assumes the place and tone of man as a public reformer . . . her character becomes unnatural.” The Grimké sisters, they suggested, were opening the way for general “degeneracy and ruin.”

Rather than persuade the sisters to stop their public work, the letter rejuvenated their determination. In 1838, Sarah published *Letters on the Equality of the Sexes and the Condition of Women*. The book argued that women deserved nothing less than full equality with men in every area of life, including the right to speak in public, and that all women should work toward that end. In turn, Angelina wrote *Letters to Catharine Beecher* (1838), answering that prominent reformer's similar charge that their work stepped too far outside the boundaries of acceptable female behavior. The idea that equality and human dignity were off-limits to women was unacceptable to either sister. As such, their fortitude and eloquent defense of their beliefs became an inspiration to later advocates of women's rights.

On May 14, 1838, Angelina Grimké married Theodore Weld, a fellow abolitionist. The next day, she attended the Anti-Slavery Convention of American Women, one of her last public acts before retiring to private life. Both sisters withdrew from the limelight after Angelina's marriage. Angelina bore three children, whom Sarah helped to raise, and both sisters became teachers in New Jersey as the children grew. On December 23, 1873, Sarah Grimké died in Hyde Park, now part of present-day Boston. Angelina followed on October 26, 1879.

### Guadalupe Hidalgo, Treaty of (1848)

Named for the small town near Mexico City where it was negotiated, the Treaty of Guadalupe Hidalgo ended the MEXICAN-AMERICAN WAR by settling the TEXAS border with Mexico, confirming American control of CALIFORNIA, and granting the United States control of the territory of New Mexico, a vast area containing all or parts of six future

states. Although the treaty achieved the territorial goals of President JAMES K. POLK and his administration going into the war, it satisfied few. Many northerners believed the Mexican War had been started under false pretenses simply to acquire more territory for slave states, and they opposed dismembering Mexico for such a purpose. For their part, southerners demanded the right to move their slaves into any territories acquired from Mexico. There was also a political faction throughout the country which believed that, since the United States had conquered all of Mexico, it should annex the whole country. In the end, the extremes cancelled each other, and the treaty was ratified. The controversy over the status of slavery in the new territory, however, helped provoke the Civil War in the 1860s.

Ostensibly worried about British and French designs in California, after taking office in 1845, Polk had tried to purchase California as well as New Mexico. The Mexicans' refusal to sell was one of the issues cited in Polk's declaration of war in 1846. Another issue was the yet-to-be-determined southern border of Texas, which the United States had annexed in 1845. The United States wanted to set the border at the Rio Grande, while Mexico insisted the Nueces River had been the boundary of Texas before 1836, when it was a Mexican province. The latter dispute most directly precipitated the Mexican-American War, when Polk directed General ZACHARY TAYLOR to occupy the disputed territory, and Mexico sent its army to dispute the occupation.

Once the war began, Polk sent an emissary, Nicholas P. Trist, to accompany General WINFIELD SCOTT's army, which landed on the Mexican coast at Veracruz and marched inland toward Mexico City. Trist, chief clerk at the State Department, was chosen as much for his loyalty as a Democrat and lack of political aspirations (in each case a contrast to Taylor and Scott) as for his acknowledged ability, record of success in Latin American diplomacy, and Spanish language skills. Polk instructed Trist to continue to offer to end the war in exchange for California, New Mexico, and the Rio Grande border for Texas; Trist could also offer up to \$30 million in compensation. After joining Scott's army in May 1847, Trist accepted a British-mediated armistice in August to begin negotiations. The armistice soon broke down, but before it did, Trist indicated his willingness to accept less territory for Texas than Polk wanted. After the war resumed, Scott's army continued its march through Mexico, and by mid-September it had occupied Mexico City. Meanwhile, Polk had gotten wind of the armistice (which he opposed) and of Trist's willingness to make concessions on the Texas boundary. Displeased, the president recalled his emissary to Washington.

Events outpaced Polk's efforts to control them, however. His order for Trist to return to Washington did not reach the diplomat until mid-November, by which time the Mexican government of General ANTONIO LÓPEZ DE SANTA ANNA had fallen and been replaced by one more amenable to negotiations. General Scott and the British consulate in Mexico City urged Trist to ignore Polk's instructions and stay long enough to conclude a peace treaty. This Trist did, and in February 1848 he forwarded the proposed Treaty of Guadalupe Hidalgo to Washington. Perhaps justifiably angry at what he considered Trist's insubordination, Polk nevertheless decided the treaty was one he could accept. Most important, it met his minimum territorial requirements, including the Texas border he wanted at the Rio Grande. Further, Polk decided the treaty could prevent a political collision damaging to the nation. Early in the war, northern antislavery forces had introduced the Wilmot Proviso, trying to prevent the spread of slavery into territory acquired in the war but also angering the president's southern Democratic friends. At the end of the war, ardent expansionists, primarily northern and western Democrats, demanded that the United States annex all of Mexico as the only appropriate compensation for the loss of American lives in the war. Southerners were unhappy that slavery apparently would be excluded from California and had an uncertain status in New Mexico. Still, opponents of the treaty could muster just 14 votes against it in the Senate; 38 Senators voted to accept it.

As approved by the Senate in March 1848, the Treaty of Guadalupe Hidalgo acknowledged the American conquest of California, ceded control of the New Mexico Territory to the United States, and established the Rio Grande as the southern border of Texas. Adding Texas, which had become part of the United States in 1845, Mexico lost over one-half of its territory to the United States in the 1840s. For its part, the United States agreed to pay Mexico \$15 million and to take responsibility for more than \$3 million owed by Mexico to U.S. citizens. In sum, apart from the territory acquired from Mexico in the GADSDEN PURCHASE (1854), the Treaty of Guadalupe Hidalgo completed the United States' continental empire from the Atlantic to the Pacific.

Perhaps because the nation's continental empire was complete, the controversy over the status of slavery in the territories worsened after the Treaty of Guadalupe Hidalgo. Northern opponents of slavery periodically reintroduced the Wilmot Proviso in Congress, without any success in enacting it into law. An important part of the COMPROMISE OF 1850 allowed for slavery's status in New Mexico to be determined by POPULAR SOVEREIGNTY; this idea held that the actual inhabitants of a territory should decide whether

## 182 Guadalupe Hidalgo, Treaty of

or not they wanted slavery in that territory. Popular sovereignty ultimately satisfied neither pro- nor antislavery forces, and the issue of slavery in the territories, reopened by the acquisition of California and New Mexico, remained unresolved until the Civil War.

## Hale, Sarah Josepha (1788–1879) *writer*

One of the most influential women of letters in the 19th century, Sarah Josepha Hale was born in rural Newport, New Hampshire, the third child of Gordon Buell and Martha Whittlesey Buell. Her family encouraged her in her EDUCATION and intellectual development, an advantage not normally available to girls at this time. She studied literature and the classics at home, and her older brother, a student at Dartmouth, tutored her. When she was 18, she started a private school for boys and girls, where she taught for seven years.

In 1813 Sarah Buell stopped teaching to marry David Hale, a local attorney. While no longer instructing students, she continued her own education and began publishing her prose and poetry in local newspapers. The Hales had four children, and Sarah spent most of her time raising them. She became ill with tuberculosis in 1819, but ultimately survived this affliction. Then, in 1822, David Hale died suddenly of pneumonia, just a few weeks before the birth of their fifth child.

Sarah Hale was now the sole provider for her family, a responsibility she assumed with characteristic vigor and creativity. After a brief stint in her sister-in-law's millinery shop, she decided to earn her living by writing. Only a year later, she published a book of poetry, *The Genius of Oblivion* (1823). She also wrote articles for magazines such as the *Boston Spectator* and *Ladies' Album*, and published the influential novel *Northwood: A Tale of New England* (1827). Hale's successes attracted the admiration of Boston publisher John Lauris Blake. In 1828, he asked her to be the editor of his new venture, *Ladies' Magazine*. Thus the 39-year-old Hale began the editing and writing career that would bring her national influence and regard.

At a time when most American periodicals merely reprinted English articles, Hale published the work of American writers such as Lydia Sigourney and Lydia Maria Child. She also wrote a large portion of the magazine's text. Her articles were republished in two collections, *Sketches of American Character* (1829) and *Traits of American Life*

(1835). In 1830, she published *Poems for our Children*, a collection that included her most famous verse, "Mary's Lamb" (more commonly known as "Mary Had a Little Lamb"). She continued to produce and edit works for children and briefly edited *Juvenile Miscellany*, a children's magazine. Many of her verses for children also appeared in the popular children's readers created by WILLIAM HOLMES MCGUFFEY.

In 1836, the *Ladies' Magazine* failed and was purchased by Philadelphian Louis Godey, successful publisher

Sarah Josepha Hale (Hulton/Archive)

of the *Lady's Book*, a fashion magazine. Godey offered Hale the highest position in the new joint publication, which she accepted. She ran the magazine from Boston until 1841, when she moved to Philadelphia. It was as editor of this publication, soon renamed *Godey's Lady's Book*, that Sarah Josepha Hale became a nationally influential figure. Uninterested in fashion, she nevertheless continued to print the innovative engravings of new women's fashions that set *Godey's Lady's Book* apart from other women's magazines. More interested in literary pursuits, Hale elevated the magazine's profile by commissioning the work of respected writers such as Emerson, Longfellow, and Hawthorne. She also wrote large portions of the text, examining numerous topics. She was best known for her articles on what she called "domestic science"—parenting, homemaking, health, and fitness.

Hale also promoted political reforms in her editorials, advocating women's education and the reform of women's property rights. Like her friend EMMA WILLARD, she believed in expanding women's educational and career opportunities but opposed woman suffrage as unfeminine. She advocated separate spheres for men and women and argued that women could best change public morality through private, domestic example. Yet she herself was a public figure who sought changes in the condition of American women.

While she transformed *Godey's Lady's Book* into a literary power, she continued to write books for women, including volumes on cooking and household management. She also compiled an ambitious 900-page reference, *Woman's Record; or, Sketches of All Distinguished Women from "the Beginning" till A.D. 1850*, first published in 1853. She persistently updated this reference, aiming to give her readers a more accurate picture of women's accomplishments throughout history. She kept up her support for philanthropic and civic causes, helping to found the Women's Medical College of Philadelphia and the Philadelphia School of Design for Women. During the years leading to the Civil War, she wrote books and editorials advocating the gradual abolition of slavery and the repatriation of former slaves to Africa. Her most famous civic endeavor was undoubtedly her effort to make Thanksgiving a national holiday. After years of campaigning on her part, Abraham Lincoln proclaimed this holiday in 1863.

By 1860 *Godey's Lady's Book* was the most widely read periodical in America, with a paid readership of 150,000. Sarah Josepha Hale continued to edit the magazine until 1877, when she retired at the age of 89; she died two years later. In her 50-year publishing career, Hale became a powerful force in American culture, promoting her belief in domesticity while gaining a kind of public stature and power rarely attained by women in the 19th century.

**Harrison, William Henry** (1773–1841) *ninth U.S. president*

Soldier, statesman of the WHIG PARTY, and ninth president of the United States, William Henry Harrison was born in Charles City, Virginia, on February 22, 1773, the son of Benjamin Harrison, a signer of the Declaration of Independence. He was educated at Hampton-Sidney College and subsequently studied medicine at the College of Physicians and Surgeons in Philadelphia. However, he became attracted to military service and joined the U.S. Army as an ensign in August 1791. Reporting to the army of Major General Anthony Wayne in western Pennsylvania, he initially served as an aide-de-camp. On August 20, 1794, Harrison distinguished himself at the victory of Fallen Timbers, whereby the Shawnee coalition of Blue Jacket and Little Turtle met defeat. He consequently advanced to captain in May 1797 and assumed command of Fort Washington, Ohio, but then resigned his commission the following year to pursue politics.

In 1799 Harrison gained an appointment as secretary of the Northwest Territory under Governor Arthur St. Clair. The following year he was elected the territory's first congressional delegate. His most notable accomplishment was passage of the Land Act Bill of 1800, which encouraged settlement and granted borrowers up to five years to pay back loans. In May 1800, President John Adams made Harrison governor of the Indiana Territory, a large wilderness tract encompassing present-day Indiana, Illinois, Wisconsin, and western Michigan. Harrison held this post for 12 years, proving instrumental in establishing a legal system, managing land disputes, and supervising Indian affairs. His tenure was also marked by sincere attempts to maintain peace with indigenous Native American nations in the region and included efforts to suppress the sale of liquor and widespread inoculation to curtail smallpox.

Unfortunately, Harrison was also authorized to negotiate as much Indian land away from them as possible. His efforts climaxed in the 1803 Treaty of Fort Wayne, whereby the United States acquired 2.9 million acres of pristine wilderness in exchange for annual subsidies. However, within six years further negotiations were thwarted by two

Shawnee brothers, TECUMSEH and his one-eyed brother, Tenskwatawa ("The Prophet"). Tecumseh maintained that the chiefs who signed the Fort Wayne treaty did not represent all Indians present and therefore it was invalid. His brother, meanwhile, had originated a new religion that called for the expelling of Americans and their culture from the Indian world. Indian resistance to further white encroachment coalesced around these two figures. Harrison met with Tecumseh repeatedly at Vincennes, the capital of Indian Territory, to seek accommodation but failed to sway his mind. The course was now set for a confrontation between civilizations.

In autumn 1811 Tecumseh ventured south to recruit Creek Indians into his anti-white confederation. Harrison availed himself of this absence by advancing with 1,000 men toward the Indian village of Prophetstown on Tippecanoe Creek. This was a move calculated to intimidate the inhabitants, but on November 7, 1811, Tenskwatawa's warriors suddenly lashed out at the intruders. A stiff fight ensued with heavy losses to both sides, but Harrison ultimately prevailed. The victorious Americans then burned Prophetstown and retired back to Vincennes without ceremony. Harrison's "victory," a close call militarily, was portrayed in the newspapers as decisive, and he basked in the newly acquired glow of national fame. Tippecanoe, however, was simply the first salvo in a bloody and protracted frontier war. It also threw Tecumseh's people into an armed alliance with Great Britain just as the WAR OF 1812 was beginning.

When war with England recommenced in June 1812, Harrison was not a major contender for a regular army commission, so through the intercession of HENRY CLAY he became a major general of the Kentucky militia. By August, the war effort was in serious trouble, and he became a brigadier general in the regular army. His orders were to recapture Detroit, disgracefully surrendered that month by General WILLIAM HULL. However, he was unable to weather endemic manpower and supply shortages, and his campaign stalled. Worse, when the army of General James Winchester was destroyed at Frenchtown, Michigan, in January 1813, British forces under General Henry Procter went on the offensive. Harrison, now a major general, countered by constructing Fort Meigs at the headwaters of the Maumee River, Ohio, and awaited their approach. Procter besieged the Americans and defeated a determined sortie by Harrison on May 5, 1813, but he lacked the manpower to storm the fort. The British withdrew to Canada, while Harrison kept accumulating men and supplies. Once Procter returned and suffered a sharp repulse at Fort Stephenson in August 1813, he withdrew from American soil altogether. Harrison then waited for Commodore Oliver Hazard Perry to win the decisive BATTLE OF LAKE ERIE on September 10, which gave Ameri-

can forces command of the waterways. Detroit was finally recaptured, and Perry thereupon transported the bulk of Harrison's army across the lake and into Canada. Several days of hard marching ensued before Harrison cornered Procter and Tecumseh at the Thames River on October 5. The affair was settled quickly by a mounted cavalry charge under Colonel Richard M. Johnson that crushed all opposition. Procter managed to escape, but Tecumseh was slain and with him died the last hope of a viable Indian confederation. In 1815 a victorious Harrison presided over the Spring Wells Treaty, which sealed the fate of Indian lands in the Old Northwest. In light of his services, Harrison was feted as a national war hero, and he received a congressional gold medal.

After the war Harrison settled in Ohio, where he gained election to state office. He returned to the U.S. House of Representatives in 1816 and also served a term in the Senate from 1825. Harrison initially functioned as a close ally and confidant of Henry Clay, a longtime aspirant to the presidency, but the two ambitious men drifted apart. In 1828 President JOHN QUINCY ADAMS appointed Harrison ambassador to Colombia, where he remained until the election of ANDREW JACKSON to the presidency. His only

William Henry Harrison (*Library of Congress*)

notable accomplishment was to enter into a dispute with General Simón Bolívar over the latter's alleged intention to establish a monarchy. Harrison then resumed a quiet life at his home in North Bend, Ohio. As a politician and diplomat, he had handled himself competently but without great distinction. Meanwhile, growing resistance to Jackson and the DEMOCRATIC PARTY culminated in the foundation of a new political party, the Whigs, in 1836. This prompted Harrison to reenter politics, and he campaigned to win the Whig nomination for president against Democrat MARTIN VAN BUREN. However, he failed for being a sectional candidate whose name appeared in only a few states. Fortunately for the Whigs, the PANIC OF 1837 ensued the following year, and public support for the Democrats dropped precipitously.

In 1840 Harrison again determined to run for the White House. Taking a leaf from Andrew Jackson, popularly known as "Old Hickory," Harrison sought broad-based, national voter appeal by packaging himself as "Old Tippecanoe," a reference to his War of 1812 endeavors. Moreover, the Whig party leadership was searching for a candidate that, in contrast to the assertive Jackson, would be more pliant towards congressional wishes. For this reason, Harrison edged out Clay as the party's nominee, despite the latter's attempt to portray him as something of a bumpkin. Thus was born the "Log Cabin and Hard Cider" campaign. Harrison was quick to adopt and exploit the imagery, contrasting his "homespun" persona against the solidly aristocratic credentials of Van Buren. His efforts were greatly abetted by a new political strategy that bore all the trappings of a modern presidential campaign: souvenirs, slick campaign publications, songs, and slogans all emerged in abundance for the first time. Harrison himself broke new ground by becoming the first American presidential candidate to stump for votes around the country. Buoyed by the famous slogan "Tippecanoe and Tyler, Too" (in reference to running mate JOHN TYLER of Virginia) Harrison easily defeated Van Buren in autumn 1840 to become the first Whig president.

Harrison did not live long enough to savor his victory. He caught a cold during his inauguration in March and died of pneumonia on April 4, 1841. Having become the first American executive to die in office, he was succeeded by Tyler, and his political legacy remains conjectural. Harrison is best remembered as a competent, if not brilliant, militia leader during the War of 1812, who did much to resurrect the reputation of American "citizen-soldiery." Regardless of his shortcomings as a politician, the memory of his earlier victories was sufficient to carry him into the White House.

## Hartford Convention

Beginning December 15, 1814, delegates from the five New England states, representing the Federalist Party, met at Hartford, Connecticut, to discuss the alleged encroachments of the national government. The convention was primarily a protest of the WAR OF 1812 (1812–15), and much has been made of the fact that the delegates discussed secession from the Union. Although such drastic steps were not taken, the Hartford Convention still made its mark by declaring the rights of states to deny the legitimacy of government acts that they believed were unconstitutional.

Some tension had begun prior to the start of the war, as New England Federalists had opposed the embargo of 1807 and other government measures against the British. Since their ECONOMY was closely linked to Britain, New Englanders were understandably alarmed by the declaration of war between the United States and Great Britain in June 1812. However, the increased wartime demand for provisions was quite a benefit, and many New Englanders ignored the embargo Congress had passed and sold supplies to British troops. On the other hand, the war was harmful to other foreign commerce and to the fishing industry. In spite of whatever profits there were to be gained from the conflict, Federalist leaders believed the interests of New England were being pushed aside for the interests of the southern states and the Democratic-Republican Party. Some New England states began to try to hinder the war effort, initially by refusing to supply militia to the federal government, and they did not support the federal loan of 1814. Finally, in 1814, several leaders in Massachusetts issued a call for a convention to address the regional grievances.

In December that year, 26 Federalists representing Connecticut, Rhode Island, and Massachusetts, sent by their state legislatures, and New Hampshire and Vermont, chosen by the Federalist Party, met in Hartford, Connecticut. George Cabot, a moderate Federalist from Massachu-

setts, presided, while Theodore Dwight served as secretary of the convention. The underlying aim of the convention was to protect the privileges of the individual states against apparent violations by the federal government. The meetings were held in absolute secrecy. Although the moderates prevailed at the convention, some extremists proposed secession from the Union and others suggested a separate peace between New England and Great Britain. The proposal to secede was ultimately rejected, but the delegates did produce a final report that was critical of James Madison and the war. The convention also recommended several changes to be enacted through constitutional amendments that would remedy the advantage New Englanders felt the South had gained. The convention urged that taxation and representation in each state should be proportionate to its free population, that no naturalized citizens should be allowed to hold office in the federal government, that the presidency should not exceed one term and the president should never be chosen twice successively from the same state, and that Congress should not interfere with foreign commerce or declare offensive war except by a two-thirds vote.

Unfortunately for the cause of the Federalists, their recommendations had little power, because the TREATY OF GHENT had been signed on December 24, 1814, while the convention was still in session. The futile Hartford Convention, which concluded on January 15, 1815, signaled the approaching end of the Federalist Party, which was already in decline because of its pro-British reputation.

### Hastings, Lansford W. (1819–1868) *developer of Hastings Cutoff*

The influential pioneer Lansford Warren Hastings was born in Mount Vernon, Ohio, in 1819, where he studied law and became a practicing attorney. In 1842 he encountered Dr. Elijah White, then passing through town with a party of emigrants bound for Oregon, and he joined the group. Hastings adapted quickly to pioneer life. Once in Oregon, he helped to survey the settlement of Oregon City for the Hudson's Bay Company.

After delving into work as a fur trader and a salmon packer, Hastings quit Oregon and ventured to Northern CALIFORNIA, where he settled in the area of present-day Sacramento to become a business partner to JOHN SUTTER. It dawned on him that business could be greatly expanded if prospective settlers back east had a com-

prehensive guidebook to facilitate their migration west. Therefore, throughout the winter of 1843, he composed *The Emigrant's Guide to Oregon and California*, which he had published in Cincinnati in 1844. Among the routes the book discussed was the so-called Hastings Cutoff to Northern California, which the author knew of but had never personally traveled. In 1846 the unfortunate DONNER PARTY attempted this route, became stranded in the High Sierras during wintertime, and lost half of its 80 members. That same year Hastings himself led the first party of California migrants across the Salt Desert to Fort Bridger. There he joined Colonel JOHN C. FRÉMONT's California Battalion and served capably during the MEXICAN-AMERICAN WAR of 1846–48.

In 1849 Hastings served as a territorial delegate to the state constitutional convention, and throughout the ensuing gold rush he resumed his legal activities in Northern California. In the late 1850s he relocated to Arizona City (Yuma) to recover his health. During the Civil War years Hastings sided with the Confederacy. His most memorable act on its behalf was an elaborate but hopelessly futile scheme to capture California, Arizona, and New Mexico for the South. After the war ended, Hastings fled to Brazil, where he again became active in colonization efforts, this time along the Amazon River. In 1867 he returned to Alabama to publish an emigrant's guide to the region. He died the following year on a voyage to recruit prospective settlers. Despite his quixotic nature, Hastings is regarded as an important force in the drive toward western migration in the 1840s.

### Hawaiian Islands

The "Hawaiian pear is now fully ripe, and this is the golden hour for the United States to pluck it," declared the U.S. minister to the Hawaiian Islands John L. Stevens in 1893. Five years later, Hawaii was "picked" by the United States and officially annexed by the government of President William McKinley. The archipelago was fully incorporated into the nation when it became the 50th state in 1959. The U.S. government had been eager to absorb the Hawaiian Islands into its plans for expansion into the Pacific and Asia at the end of the 19th century. However, it was private American citizens more than government officials who took the lead in wresting the islands away from the Hawaiian monarchy and securing them under U.S. sovereignty.

Hawaii is composed of eight main islands (including Kauai, Oahu, Maui and Hawaii, also called the "Big

Island”) and located nearly 2,500 miles from the U.S. mainland. Various Polynesian peoples, principally the Marquesans and Tahitians, originally settled the archipelago more than 1,000 years before English naval captain James Cook first reached it in 1778. Over the course of its early history, Hawaii existed in virtual isolation and remained unknown to the world beyond Polynesia.

The unification of the Hawaiian Islands under a single indigenous monarch, KAMEHAMEHA I (also known as “the Great”) occurred almost simultaneously with the arrival of the first European explorers. As late as the 1780s Hawaii was divided into three kingdoms. By the end of the 1790s Kamehameha had conquered a significant portion of the archipelago, including the islands of Hawaii, Oahu, and Maui. In 1810 the islands of Kauai and Niihau submitted to his rule and signaled the unification of the entire island chain under the Kamehameha dynasty, which would last until the 1890s.

During Kamehameha’s early struggle for domination over Hawaii, Captain James Cook and the crews of his ships the *HMS Resolution* and the *HMS Discovery* first sighted Oahu on January 18, 1778. Two days later, they made landfall on the island of Kauai, introducing the isolated archipelago to the western world. Cook stumbled across the islands as he was attempting to find the legendary pathway across the North American continent known as the Northwest Passage. The initial interaction between the British and the Hawaiians was generally very cordial; the British traded various metal trinkets, which completely fascinated the Hawaiians, for essential provisions.

Almost immediately, social and sexual fraternization began between Cook’s crew and Hawaiian women. The local *kahunas* (Hawaiian shamans) encouraged this interaction as a way to test the divinity of the British in the belief that if these men were gods, they would not desire the women. Cook’s men proved themselves to be quite mortal. Unfortunately, sexual exchange introduced various forms of venereal and other diseases to the Hawaiians. The Native population, which was estimated to have been about 300,000 at the time of Cook’s arrival, fell to under 150,000 by 1820.

Cook named the island chain the Sandwich Islands in honor of his patron, the British noble John Montagu, the Fourth Earl of Sandwich. The name would eventually be replaced as American influence overtook that of the British in subsequent decades. Despite this auspicious beginning, which included Cook’s deification as a local god, hostility developed between the British and Hawaiians over the theft of one of Cook’s boats. This antagonism turned into armed conflict on a return visit in 1779 during which Cook was killed.

Cook’s death, however, did not signal the end of relations between Hawaii and the West. The islands became

a significant provisioning port for American and European trading ships sailing to and from Asia. The Hawaiians felt the impact of the West, and not only in terms of trade and the unfortunate consequences of disease. Kamehameha made use of two captured sailors, John Young and Isaac Davis, as well as a confiscated American vessel and cannons, in his efforts to consolidate power over the archipelago.

Whites, called *haoles* by the Native population, began settling the islands in the early 19th century. Although most of the white settlers were sailors and entrepreneurs, Christian missionaries also came to Hawaii in search of new converts. They played a significant role in imposing western domination over the islands. Under their influence, the traditional Hawaiian cultural system, *kapu*, was terminated, the Hawaiian language was altered, and an extensive public school system was created. Not only were whites exercising social influence in the islands, but they came to dominate local politics and threaten the power of the Hawaiian monarchy throughout the 1800s. In 1840 Kamehameha III called for a change in rule from an autocracy to a constitutional monarchy with a bicameral legislature. Hawaiians also adopted their first constitution and bill of rights that same year. Missionaries were influential in these reform efforts.

Under the Great *Mahele*, carried out in 1848, royal lands were made public and commoners were granted the right to purchase their own property. Unfortunately for the majority of Hawaiians who hoped to benefit from this land distribution, foreigners were granted permission to buy lands in 1850. By the end of the century, rich white businessmen had purchased almost four times as much land as Hawaiians, reducing much of the local population to propertyless tenancy.

White settlement also had great economic impact on the islands. The early 19th century witnessed the massive expansion of whaling in the northern Pacific. As a consequence, Hawaii became the chief port for whaling vessels, particularly those owned and operated by Americans. Much of Hawaii’s agriculture was directed towards provisioning whaling vessels. Yet by the 1850s, interest in whaling was declining and sugar production, introduced to the islands by the American George Wilfong in the late 1840s, was expanding. Sugar production in Hawaii exploded in the second half of the 19th century as an almost insatiable demand for refined sugar in the United States grew. The sugar industry would irrevocably change Hawaiian society.

Because sugarcane production is labor-intensive and the Hawaiian labor force was declining as a result of disease, planters began to import labor in massive numbers with the passage of the 1850 Masters and Servants Act. More than 200,000 laborers, mostly Japanese and Chinese,

would be brought to the islands by the turn of the century. This demographic shift would make Hawaii a veritable rainbow of ethnic diversity. However, it would also push indigenous Hawaiian influence to the periphery of social and political life.

The final blow to Hawaiian rule came in the 1890s. American planters and merchants, led by Sanford B. Dole, instigated the overthrow of the Hawaiian government. The Americans saw their economic interests endangered by indigenous rule and sought closer ties to the United States. They carried out an outrageous, if bloodless, coup in January 1893. They were given armed assistance by Marines from the USS *Boston* and easily toppled the Hawaiian monarchy. Not wanting to see any of her people killed, Queen Liliuokalani reluctantly capitulated. Upon taking over the government, Americans sought the islands' annexation by the federal government, which happened in August 1898. In June 1900 Hawaii became a U.S. territory, and all those residing in Hawaii, whether they wanted to or not, became U.S. citizens.

### **Hicks, Elias** (1748–1830) *Quaker reformer*

A Quaker reformer, Elias Hicks was born in Hempstead Township, Long Island, New York. His parents were formally Anglicans, but his father joined the Society of Friends (Quakers) shortly before his birth. As a youth, Hicks received little formal education and was apprenticed as a carpenter. In 1777 he inherited his family farm, which he managed until his death 53 years later. Throughout his early manhood, Hicks behaved like a typical Quaker of his class. Being well versed in the Bible, early Quaker literature, and basic Christian history, he was commonly present at annual gatherings of Friends in New York and Philadelphia. However, by the early 19th century, he began espousing a radically different interpretation of his sect's beliefs.

During childhood, Hicks had apparently experienced visitations of "divine grace." As he matured, he frequently lectured on the fundamental necessity of acknowledging the "Inner Light." This manifestation of God's will and love, he maintained, was self-evident and open to all. Furthermore, in placing great emphasis on personal revelation from God, he openly downplayed the significance of the Bible as a guide to salvation. He also reinterpreted the story of Jesus as an example of a perfect man aware of the presence of God within him. Hicks's teachings were a radical departure from the established tenets of Quakerism and the source of

a contentious schism among the Friends. Henceforth, from 1828, the Quakers became divided between two distinct sects. The so-called Hicksites embraced their founder's notion of personal revelations for spiritual guidance, while the more traditional Orthodox reaffirmed their emphasis on the Bible and the teachings of Christ as the only source of salvation. Hicks's centrality of the importance of personal salvation also called into question the moral and religious authority of elders guiding the Quaker movement.

In a more practical sense, Hicks was at odds with modernity. He waxed highly critical of fellow Quakers who had grown wealthy and participated actively in the larger community about them. He demanded that they remain aloof from the world and not pursue money or other activities that ground "the faces of the poor." Moreover, Hicks was profoundly abolitionist in outlook and openly condemned Quakers who owned slaves. His beliefs mandated that AFRICAN AMERICANS should enjoy the same intrinsic right to liberty as all human beings, and he advocated the boycott of slave-produced goods such as rice and cotton.

Hicks died at his farm in Jericho, New York, on February 27, 1830. The schism he started, and the theological recriminations it engendered, endured among the Society of Friends long after his passing. For this reason, Hicks is regarded as a major religious reformer of the early to mid-19th century.

### **Horseshoe Bend, Battle of (Tohopeka)**

(March 27, 1814)

This battle between American forces and rebel CREEK (Muskogee) Indians known as the "Red Sticks" effectively ended the Red Stick War of 1812–14. The Red Sticks resisted the Americanization (adoption of white cultural practices) of the Creek, which had been taking place within the nation for decades. There was increasing pressure on the Creek to abandon communal land ownership and adopt the white practice of private land ownership, which would allow them to sell much of their land to the United States. Many of the Creek, led by mixed-blood chiefs, were open to change. However, a considerable number rejected the

changes taking place and erupted into open rebellion with the United States and the pro-American Creek in 1812, causing a civil war within the nation. These rebel Creek, or Red Sticks, wished to return to a more traditional way of living centered on a new prophetic movement designed to restore traditional values. This new religious movement also called for little or no contact with white people and an abandonment of most facets of white culture which the Creek had adopted.

Throughout 1812 and 1813 the Red Sticks skirmished with the pro-American Creek. In 1813, the United States and the Red Sticks began open warfare at the Battle of Burnt Corn. By March 1814 about 1,000 Red Stick warriors and 400 women and children had assembled along the Tallapoosa River in modern-day Alabama. Tohopeka, the town the Red Sticks built there, lay in a horseshoe-shaped bend in the river. Under the guidance of the war chief Menawa, they built fortifications on the land side of the town, enclosing it effectively against attack. Less than one-third of the Red Sticks had guns (although they did not reject the use of guns, they could not acquire any); most had clubs, knives, and bows and arrows. However, the Red Sticks did not fear the upcoming battle, for their religious leaders (or shamans) had assured them that they were protected by sacred forces and could not be harmed by their enemies' bullets.

As the Red Sticks prepared for war, about 1,500 Americans—commanded by ANDREW JACKSON and supported by 500 CHEROKEE and 100 pro-American Creek—marched to Tohopeka. On March 27, 1814, the Americans attacked. The Red Sticks withstood the siege for hours, despite the much larger force and superior arms of their attackers. However, the Americans charged the fortifications while their Cherokee allies crossed the river and assaulted the Red Sticks from the rear, which cut off their means of escape and broke their resistance.

Andrew Jackson promised that no quarter (mercy) would be given to the Red Sticks if they chose to fight. As a result, many of the rebel Creek were killed in the river while trying to escape. The Red Sticks suffered catastrophic losses, as 800 warriors died and 350 women and children were captured. Many of the surviving Red Sticks surrendered after the battle, while some fled to FLORIDA to join with the Seminole. Many of these rebel Creeks fought in the subsequent SEMINOLE WARS of 1818–19. However, the Battle of Horseshoe Bend effectively ended the Red Stick War and allowed for further American expansion into the southern United States.

**Houston, Sam** (1793–1863) *Texas statesman and military commander*

Born in Virginia and later a congressman from Tennessee as well as a political protégé of ANDREW JACKSON, Sam Houston was most significant for his role in the early history of TEXAS. Immigrating to that territory in 1832, he became commander in chief of the army during the TEXAS REVOLUTION and later first president of the Republic of Texas. After Texas was admitted to the Union as a state in 1845, he served as a U.S. senator and finally as governor.

Houston had minimal formal schooling in Virginia. His family moved to Tennessee when he was 13, and he grew up on the Tennessee frontier. During the WAR OF 1812, he served as a lieutenant in the army commanded by Major General Andrew Jackson, and he participated in Jackson's campaigns throughout the South. When the war ended, Houston returned to Tennessee, read law, and became a practicing attorney. It was a youth and adolescence similar to that of many ambitious young men on the early frontier of the trans-Appalachian West.

Like other energetic young men, Houston found himself drawn to politics. He was a friend and partisan of Andrew Jackson's at a time when Jackson was the most famous figure in the state. Houston was elected to the U.S. Congress in 1823, and four years later, he was elected governor of the state of Tennessee. In 1829 he married Eliza

Sam Houston (Library of Congress)

Allen. At this point, his successful personal and political career took another direction. For reasons that he never explained, but perhaps because his wife had left him, Houston resigned the governorship and took up residence in Indian Territory (now Oklahoma), where he became a member of the CHEROKEE nation, taking an Indian name, assuming the dress of that nation, and marrying a Cherokee woman. He lived among the Cherokee until 1832, when he and his Indian family moved to Texas.

Texas was then a state called Coahuila-Texas in the Republic of Mexico. Nevertheless, its population was predominantly Anglo-American settlers recently arrived from the Mississippi Valley. These approximately 20,000 settlers had come to Texas under a system of contracted immigration, arranged by STEPHEN F. AUSTIN, another figure who would be indelibly associated with the formative years of the American occupation of Texas. Houston was a natural leader with important political connections with the government of the United States, and his arrival was widely noted. There were even suggestions that he had come as the personal representative of his friend, President Andrew Jackson, although this connection was never made directly.

Houston found Texas in a state of uneasy confusion. Many prominent Texans were agitating for a greater degree of autonomy—perhaps even independence preparatory to a future union with the United States. The officials of the Republic of Mexico in both Texas and Mexico City were aware of this interest and opposed to it. Austin, the most prominent figure in Texas, favored searching for a redress of grievance through official means, and he supported a continued connection with the Republic of Mexico. When the American settlements drafted a series of petitions to the government in Mexico City, Austin was the unanimous choice to make the case for the Anglo-Texans. Although he gained much of what the Texans sought, Austin was arrested and confined in Mexico City. During his two-year absence, others, including Houston, assumed positions of leadership in the Texas community.

Houston was among those who wanted greater independence for Texas, and this feeling was increasingly shared after the ascendancy to power of General ANTONIO LÓPEZ DE SANTA ANNA, who seemed to threaten the rights that Texans thought were guaranteed to them under the Mexican Constitution of 1824. As Santa Anna pursued a series of military campaigns to solidify his power, he eventually turned his attention to the north, where he saw Texas in what he considered a state of open rebellion. Divided Texan voices and poor military leadership led to military disasters at Goliad and at THE ALAMO, but these defeats only strengthened their resolve for independence. Houston was a delegate to the Convention of 1836, and he signed the Declaration of Independence drafted by that body. In March

1836 the delegates to the convention chose him as commander in chief of the Texas army. Given charge of a small and poorly trained body of men, he pursued an unpopular policy by retreating to the east and north toward the Louisiana border. Then, in a surprise move, he marshaled his forces to confront Santa Anna and the much larger Mexican army near the San Jacinto River, where Houston ordered a frontal assault. In 20 minutes the Texas army had won an overwhelming victory. The Mexican army lost 630 killed and an equal number taken prisoner; the Texan losses were a mere handful. Against all odds, Houston had saved Texas.

As the most popular figure in the republic, Houston easily defeated Austin for the presidency of the new Republic of Texas. The election showed that the immediacy of a military victory had easily overshadowed Austin's contributions in building Anglo-Texas over 15 years. As president of the republic, Houston pursued a cautious policy of engagement with the United States. The American government had backed away from immediate annexation, sensitive to diplomatic criticism of its conduct during the war. Texas's status had also become embroiled in the controversy over SLAVERY, since it was sure to make application to enter the Union as a slave state. In spite of these difficulties, Houston remained convinced that the destiny of Texas was inevitably bound to the United States.

Houston's policy of correct diplomatic engagement with the United States and European nations and even his attempts to come to terms with Mexico aroused political opposition within Texas itself. Furthermore, he was a strong personality who made no secret of his likes and dislikes. Mirabeau B. Lamar led the opposition, and he became Houston's political rival over the next decade. At the end of Houston's first term as president of the Republic of Texas (he could later serve a second, though nonconsecutive, term), Lamar was elected his successor. Lamar pursued a policy of expansion and confrontation with Mexico, with the Indian peoples of Texas, and eventually with the United States over Texan claims to the upper reaches of the Rio Grande. Most important, Lamar moved the capital from Houston to a frontier village soon renamed Austin; it was the most enduring of all his policies.

When Houston was elected governor again, he resumed his patient negotiations with the United States over annexation. With the election of JAMES K. POLK in November 1844, the American nation signaled its expansionist interest, and Texas was a logical object of it. Consequently, both houses of Congress approved a joint resolution for annexation in January 1845. Houston's policy of engagement with the United States had succeeded.

Upon the admission of Texas to the Union in 1845, Houston was elected a U.S. senator. Throughout the 1850s he walked a fine line in his allegiance, always the Texas patriot but often critical of rising southern nationalism.

By the mid-1850s he had come to support the KNOW-NOTHING PARTY as an alternative to southern sectionalism. Increasingly, he showed a strong commitment to the preservation of the Union in the face of growing southern sentiment for secession.

Again elected governor of the state in 1859, Houston immediately expressed his opposition to the convention called in support of secession. When the convention met in early 1861, he refused to take an oath of loyalty to the newly formed Confederate States of America. The state legislature declined to impeach him, probably because of his many services to the republic and the state over 30 years. Instead, it simply declared the office of governor vacant, and his duties were assumed by the lieutenant governor. Houston retired to his home, where he declined to accept an offer of federal troops to support him and his stand. Houston firmly supported the Union, but he refused to engage in a policy that would pit Texan against Texan in a violent confrontation. Houston spent the rest of his life at his home, embittered by Texan secession and the loss of the governorship. He died in 1863.

### **Hull, William** (1759–1825) *soldier*

Distinguished service marked the beginning of William Hull's military career, and a court-martial brought it to an end. Hull was born in Derby, Connecticut, on June 24, 1753. He attended Yale College, where he contemplated entering the ministry but later decided on a career in law. He practiced law in Litchfield, Connecticut, but even the legal profession did not hold Hull's attention. At the onset of the Revolutionary War (1775–83), he devoted himself to the military. Serving admirably in the Continental army, he was promoted to major in 1777 and lieutenant colonel in 1779. He also fought at the battles of Trenton (December 26, 1776) and Princeton (January 3, 1777). After the war, Hull practiced law in Massachusetts and married Sarah Fuller in 1781. In 1787 he assisted in putting down

Shays's Rebellion (1786–87). Elected to the Massachusetts state senate in 1798, he openly sided with the Democratic-Republican Party. In 1805 President Thomas Jefferson appointed Hull governor of Michigan Territory, where he served for seven years. During his terms as governor, Hull successfully acquired land cessions from Indian nations in the territory, including the Chippewa, Ottawa, Potawatomi, Shawnee and Wyandot. Many Indian leaders, such as Tecumseh, disliked Hull for his dealings with NATIVE AMERICANS.

The WAR OF 1812 (1812–15) brought Hull back to the military when he reluctantly accepted a position as a general in the Old Northwest. President James Madison ordered him to invade Upper Canada at the onset of the war, but the campaign foundered immediately. British general Sir Isaac Brock drove Hull's force of 2,000 soldiers back to Detroit, even though the American troops were larger in number. Meanwhile, the British and their Native American allies (many of whom were injured by Hull's Indian policy as governor of Michigan Territory) cut off reinforcements. On August 16, 1812, fearing for the town's population, Hull surrendered Detroit to Brock and returned ignominiously to the United States to face a court-martial. The court found him guilty of cowardice, neglect of duty, and misconduct as an officer, and sentenced him to death for the Detroit debacle. However, President Madison pardoned Hull from the death penalty because of his service during the Revolutionary War and his advanced age. Hull's nephew, Commodore Isaac Hull, restored the family name with his naval performance during the War of 1812.

Hull spent the rest of his life acquitting himself. He wrote two books—*Defense of Brig. Gen. Wm. Hull* (1814) and *Memoirs of the Campaign of the Northwestern Army of the United States: A.D. 1812* (1824)—which sought to explain his actions at Detroit. He died in Newton, Massachusetts on November 29, 1825.

—William J. Bauer, Jr.

## immigration

In the first great wave of 19th-century immigration, about 5 million people entered the United States between 1820 and 1860. Nearly 1.6 million were natives of Ireland, and 1.5 million more were from Germany. During the 1820s, the Irish and Germans accounted for more than 40 percent of immigrants; in the 1830s, they accounted for approximately 60 percent; and in the 1840s and 1850s, they made up more than 70 percent of immigrants. English immigrants accounted for 15 percent or less of the total. Small numbers of Scandinavian and Canadian immigrants also entered the United States during the time. Approximately 80,000 Mexicans became U.S. residents during the mid-19th century, but not through immigration. Instead, they gained the rights of American citizens following the American absorption of TEXAS and much of the American Southwest (comprising modern-day CALIFORNIA, Nevada, Utah, and parts of New Mexico, Arizona, Wyoming, and Colorado) following the MEXICAN-AMERICAN WAR (1846–48). These lands were ceded in the 1848 TREATY OF GUADALUPE HIDALGO between the United States and Mexico. Also in the late 1840s, some 25,000 Chinese immigrants arrived during the CALIFORNIA GOLD RUSH and established residence.

Necessity and opportunity were the primary driving forces for immigration. From the 1830s, declining economic conditions led Irish farmers to emigrate to the United States. During the mid-1840s, the numbers of immigrants increased sharply after potato blights destroyed Ireland's primary source of food and commerce. Compounding the problem was the treatment of farmers by the landowners. Although dairy products and other foodstuffs were raised successfully in Ireland, they were used mainly for export to England. This left tenant farmers dependent on potatoes, and when those rotted from blight, many starved. One million of Ireland's 8 million inhabitants died of hunger and other related conditions during this time. One quarter of those remaining even-

tually immigrated to the United States, in what became known as the Great Migration.

For Germans, economic necessity and failed revolutionary movements in 1830 and 1848 led them to migrate to North America. So many thousands came to the U.S. after the failures of the 1848 European revolutions that they were known as Forty-Eighters. As they had been for decades, peasants and artisans were also solicited by U.S. labor agents, who offered work in a rapidly industrializing country. Agents further enticed potential immigrants with the chance to own inexpensive land in the West. For many European Jews, the United States also offered a chance to escape religious discrimination.

Other Europeans became immigrants for economic reasons. Certain factors were common to all these groups; industrialization and commercial agriculture played important roles. As the large-scale practices of commercial agriculture increased during the early 19th century, small farmers throughout Europe were unable to support themselves. Similarly, the low-cost, factory-made products that industrialization brought to the market ended the livelihood of many European craftsmen. A further stimulus to migrate to the United States was the low cost of steamboat transportation, which made the transoceanic trip possible.

One characteristic of migration was its growth as the 19th century progressed. During the 1820s, 152,000 immigrants entered the United States, which had a population in 1820 of 9.6 million. The 1830 population was 12.9 million, and in the decade that followed, 599,000 immigrants entered the country. The population in 1840 was 17 million; 1,713,000 immigrants entered during the next 10 years. By 1850, the population was 23.2 million; that decade saw the entry of 2,598,000 immigrants. In the 1820s, slightly more than one of every 1,000 U.S. residents was a new immigrant; in the 1850s, it was more than nine of every 1,000. Immigrant Irish brought New York City unprecedented increases in numbers, accounting for 343,000 of the city's 1850 population of 515,547. Overall, the millions of

This engraving shows Irish emigrants getting ready to leave their famine-stricken homeland for the United States. (*Library of Congress*)

immigrants and a fertile young populace combined to make the United States grow more quickly than any other nation during the 19th century, increasing from 5 million to about 31 million between 1800 and 1860.

The boat voyage that brought immigrants to North America was lengthy and hazardous, usually taking place aboard a steamer (known to Irish immigrants as a “coffin ship”) that was overcrowded and invited disease. In 1832, Irish immigrants carried cholera aboard ship to Canada and through to New York, resulting in hundreds of deaths. Most of these and other Irish immigrants were young (under 35 years old) and without money, traveling in small groups or alone. Other family members came when the new immigrant was able to raise funds. In contrast, most German

immigrants traveled as families, and, at least with the early groups, had more money. From 1849, most European immigrants entering New York passed through a receiving station called Castle Garden, in lower Manhattan.

Immigrants from all countries adopted various methods to adjust to an unfamiliar land. From friends and relatives, they learned about the country and of relatively hospitable regions. Although both Irish and German groups settled in northeastern coastal cities, including Boston, New York, Philadelphia, and Baltimore, some settlers moved into the nation’s midsection to work on canals, railroads, and roads. Eventually, many German immigrants settled widely across the United States, establishing farms and homes in the Ohio Valley, along the Mississippi River to Missouri, within

the Great Lakes region in Wisconsin and Minnesota, and in Texas. More than 950,000 Germans migrated to the United States during the 1850s. So great and varied was German settlement that its well-populated states formed a continuous line from New York to Minnesota known as the “German Belt.” Only one in eight of all new immigrants entered the cotton-dominated South.

Once arrived, new immigrants turned to formal and informal ethnic networks that provided information and leads for housing and jobs. Although most colonial-era Irish and German immigrants were Protestants, those arriving during the 19th century were largely Roman Catholics who looked to the church for social support. Ethnic newspapers and social clubs, particularly those for German immigrants, also provided community support.

Types of work and working conditions varied among these immigrants. Although there were some skilled craftsmen, professionally trained people, and intellectuals in the immigrant mix who became artists, journalists, shopkeepers, and political leaders, most immigrants were former farmers and manual laborers. This was particularly true among Irish immigrants. Along the eastern coastal cities, laborers found work (much of it day labor) in construction sites, factories, canals, railroads, or textile mills. Given their need for labor, textile mills were favored sites of employment for Irish immigrant families, since they provided ready sources of work for entire families that needed money. Female Irish immigrants, however, were often subjected to faster work paces and lower pay rates than their native-born counterparts. Some Irish immigrant women were also employed at home doing piecework or as domestic servants. As one journalist wrote in 1860, “There are several sorts of power working at the fabric of this Republic: water-power, steam-power, horse-power, Irish-power. The last works hardest of all.” German immigrants were more likely to work in light industry or crafts work, which utilized their earlier training as artisans. Other immigrants of the era from England, Canada, or elsewhere were less likely to take jobs as domestic servants or day laborers. Instead, they worked as farmers, in construction, or in higher-level machinery work.

Over time, immigrant groups also developed various social and cultural specialties that allowed them to enrich and be integrated into the American way of life. German immigrants became known for their ability to provide various types of entertainment, which spanned the popular venues of dance halls and beer gardens to choral and classical music. For example, in 1835 German immigrants founded the first U.S. vocal music society, the *Maennerchor* (Men’s Choir); in later decades, they led in the formation of musical societies in other cities. German immigrants were also central to bringing classical music to the United States; in 1855, an early conductor of the New York Phil-

harmonic Symphony Orchestra was German immigrant Carl Bergmann.

Many Irish immigrants developed a political expertise that won them local and statewide positions. (President ANDREW JACKSON was the son of Irish immigrants who arrived before the Great Migration.) They were able to establish voting blocs and infiltrate traditionally English and old-immigrant neighborhoods.

From the 1830s through the 1850s, the influx of 2.2 million immigrants, many of them destitute and Roman Catholic in an overwhelmingly Protestant nation, roused deep anti-immigrant sentiment in the United States. Most earlier Irish immigrants were Protestants from northern Ireland and thus easily accepted into American society. Newly arrived German Roman Catholic immigrants held beliefs that were more agreeable with prevailing northern thinking, such as participation in public schools. Pro-Union, in later years they were instrumental in the presidential victory of Abraham Lincoln. Additionally, when they arrived in the United States, German immigrants often had more money than their Irish counterparts and possessed greater training for skilled work.

These anti-immigrant attitudes, which represented the first large-scale nativist movement in U.S. history, were manifested in many ways. Newspaper postings for work and housing often included the catchphrase “Nina”—“No Irish Need Apply.” Beginning in the 1830s, periodicals featured warnings of “popish” plots for the Catholic appropriation of the nation. One notable anti-Catholic spokesman was SAMUEL F. B. MORSE. Now best known for his invention of the telegraph, he was famous then for his 1834 series of letters, *A Foreign Conspiracy Against the Liberties of the United States*.

Violent demonstrations of anti-Catholic opinion occurred throughout the period of the Great Migration, usually in cities with large immigrant populations. One

Immigration to the United States, 1830–60

prolonged argument centered on the ongoing Irish objection to using the Protestant King James Bible in public schools and one school board's response to it. In 1844 the Philadelphia school system exempted Catholics from using Protestant-leaning textbooks and permitted the use of the Catholic Douay version of the Bible. In response, Protestant and Catholic rallies and demonstrations erupted and resulted in two riots, ending in 30 deaths, 150 injuries, and the destruction of two Catholic churches. It was the most violent religious confrontation in the United States to date. In the 1850s ANTI-CATHOLIC RIOTS occurred in Boston and elsewhere.

Anti-immigrant forces also attempted to control immigration and immigrants' rights through political means, forming various political parties to promote their goals. In 1837 the Native American Association was founded to counter nonnative groups, particularly Catholics; its formal political party, the Native America Party, was founded in 1845. Also organized to curtail immigrant rights was the American Republican Party, founded in 1843. Its goal was to prevent immigrants from holding elected office. Most influential nationally was the American Party, more commonly known as the KNOW-NOTHING PARTY. Founded in mid-century as memories of the bloody 1844 Philadelphia riots faded, the Know-Nothing Party aimed to bar immigrants and any Catholic from public office. Affiliated with this party was MILLARD FILLMORE, who became president following the death of ZACHARY TAYLOR in 1850.

In the West during the gold rush, Chinese immigrants faced what would in later decades become escalating discrimination. As prospectors, they were granted access only to gold claims already examined by white prospectors.

Nativist movements and focus on anti-immigration diminished at the end of the 1850s as conflicts escalated between the North and the South. Immigrants were needed to defend the Union; thousands did, serving in many Irish- and German-immigrant divisions. Their participation in the Union army during the Civil War was important to the Northern triumph. Among notable Irish commanders were General Philip Sheridan and immigrant General Thomas Francis Meagher, leader of a Union Irish brigade. German immigrant Civil War generals included Carl Schurz, who later worked for President Lincoln. Such soldiers helped to contribute to the assimilation of all 19th-century immigrants into the United States.

Despite adversity, immigrants who arrived between 1820 and 1860 would be the last group to have relative freedom from immigration laws. The second wave of immigrants, who would arrive between 1880 and 1920, would face more stringent legislation, beginning with an 1862 law prohibiting American ships from bringing Chinese immigrants to the United States. Such legal measures would

increase in scope throughout the century. Still, the immigration surge that began in the early 19th century continued to grow until World War I, seeing its largest number of arrivals—20 million—during the highly regulated period of 1880 to 1920.

## Indian Affairs, Bureau of

The Bureau of Indian Affairs (BIA) is the office of the federal government responsible for many aspects of NATIVE AMERICANS life. Among the several different activities within its jurisdiction in the 20th century are EDUCATION, employment, police, welfare, AGRICULTURE, and industrial development. Because of the BIA's enormous influence over Indian affairs, from the beginning it has been the source of great controversy among Native Americans and white Americans over its duties and their execution.

The BIA has a long history that is deeply enmeshed in the thorny relationship between the United States's majority population and its Indian minority. After the U.S. Constitution was written and ratified, the new government organized in 1789 gave the War Department responsibility for overseeing all relations with Native peoples. This structure reflected the view that Indian peoples were a military issue, and so they were to be dealt with by the military arm of the government. Given the continuing confrontations between settlers and Native Americans in the 1780s and early 1790s, this position was understandable.

In 1806 a separate Office of Indian Trade was organized, again under the aegis of the War Department, to manage the factory system, an attempt to regulate trade with Indian peoples in a fairer and more honest manner than that pursued by private fur-trading companies. Although the factory system was a success in fostering better relations with Indian peoples, it was constantly under attack by fur-trading interests as unfair competition, and Congress abolished the system in 1822. Two years later, Secretary of War JOHN C. CALHOUN established a Bureau of Indian Affairs within the War Department, appointing Thomas L. McKenney its first chief. McKenney had been superintendent of Indian trade from 1816 to 1822. His duties, as defined by Congress, were to supervise the financial arrangements that arose out of "laws regulating

intercourse with the Indian tribes.” In his reports, McKenney called the agency the “Office of Indian Affairs.” (The name remained in use until 1947, when “Bureau of Indian Affairs” again came into use.) In some ways, McKenney was more a financial officer than one concerned with policy. But as in so many cases having to do with the federal government, especially in the 19th century, financial issues became closely associated with issues of policy.

In 1830, when Congress passed and President ANDREW JACKSON signed the INDIAN REMOVAL ACT, it became clear that removal was to become the government’s favored solution to the Indian presence east of the Mississippi River. Partly in response to this new direction, Jackson replaced McKenney, although the latter had strongly supported the Removal Act in 1832. Congress then established the bureau-level Office of Indian Affairs, headed by a commissioner appointed by the president and confirmed by Congress. The office was still an agency of the War Department, and the new commissioner reported to the secretary of war. The commissioner was charged with the “direction and management of all Indian affairs and all matters arising out of Indian relations.” Two years later, another law provided for the reorganization of the Department of Indian Affairs, establishing several new agencies and superintendencies.

The Office of Indian Affairs was responsible for conducting removal negotiations as well as for oversight of existing treaties. In cooperation with the U.S. Army, the Office directed the removal of the remaining nations east of the Mississippi to new reservations in Indian Territory (later the state of Oklahoma). This process was accomplished through a series of treaties of questionable legality and legitimacy, and, where necessary, through the use of force. The most noteworthy example of enforced removal and its disastrous results was the roundup of the remaining Cherokee in Georgia in autumn 1838, and their enforced removal during the winter of 1838–39 on a march known as the TRAIL OF TEARS.

With the removal of Indians east of the Mississippi to the West, debate began anew over whether the management of Native American affairs properly lay within the War Department. In 1849, the Office of Indian Affairs was transferred to the newly created Department of the Interior. By this time, the bulk of its responsibilities had to do with the administration of the Indian Territory reservations as well as the other reservations scattered throughout the nation. The office has frequently been accused of fostering government dependency among Native peoples during this period by arbitrarily depriving them of their traditional lifeways, social structures, and even their own names. Certainly, there have been many examples of unscrupulous government agents. Some agents were known to withhold food rations from recalcitrant individu-

als; others cheated nations out of funds that the government had held in trust. Such experiences spurred feelings of bitterness and distrust on the part of Native Americans toward the government.

The agency’s name was changed to the Bureau of Indian Affairs in 1947, although its mission and its place within the Department of the Interior remained the same. Today, the BIA attempts to work in concert with tribal governments to establish health, education, and economic development programs to benefit Native groups.

## Indian Removal Act

The Indian Removal Act was passed by Congress on May 28, 1830. Most commonly associated with the removal of the CHOCTAW, CHICKASAW, CHEROKEE, CREEK and SEMINOLE nations from the American Southeast, the act authorized the president of the United States to facilitate the exchange of NATIVE AMERICANS lands anywhere in the East for lands west of the Mississippi River. Passed because of pressure from whites, the act marked the beginning of vigorous era of government-sponsored removal. For American Indian nations, the policy would exact a tremendous material, spiritual, and human cost.

Pressure for the government to institute a national removal policy came from several sectors of American society. Proponents of such a policy shared two main concerns. The first was that the United States had a compelling need to expand westward. The second was a fear of Indian attack as such expansion took place.

At the turn of the century, the United States had yet to significantly expand its territory. The fur trade provided the most important contact between white settlers and American Indians across the Midwest. The government had long hoped to open the Ohio Valley up to settlement, believing it would provide the means to settle war debts. The region was rich with timber, while its waterways offered the makings of a transportation network and source of mechanical power. In the Southeast, American Indian communities controlled a significant part of Georgia and most of present-day Florida, Mississippi, and Alabama. To white Americans, this region’s fertile soil held the prospect of expanded cotton production, a lucrative

enterprise thanks to improvements in spinning technology in industrial Britain. This and the increase of the American population pressured the government to smooth the way for expansion into the West.

American designs on Indian lands were compounded by cultural prejudice. Few Americans believed that American Indians made productive or sensible use of their land. Many observers, journalists, and politicians argued that Native American groups relied on hunting, an enterprise that ought to give way to settled agriculture under the principles of natural law. Confusion over appropriate gender roles lay at the root of much of this belief. To white Americans, a society was best judged by the actions of men. Observers therefore viewed the business of hunting, diplomacy, warfare, or limited participation in AGRICULTURE as a male prerogative. In most American Indian communities, farming was a female activity, a fact that many observers argued showed the laziness of Indian men and the backwardness of Native American culture. In reality, many American Indian communities across the Southeast thrived on the intensive agriculture they practiced. Men and women had their own particular responsibilities which contributed to the health of the nation, and even those Native groups who relied on hunting and gathering engaged in the careful and purposeful cultivation of wild food sources.

While most Americans shared the idea that Indian communities were a 'problem' for the expanding nation, not all agreed that removal was an appropriate response. A reform movement flourished in the first three decades of the 19th century, arguing that through education and religious instruction, Native American communities could be remade in the image of the U.S. ideal. Religious groups such as the Quakers, Moravians, and the American Board of Commissioners for Foreign Missions made heavy investments of time and money to this end.

Many Americans believed, however, that Native American groups were fundamentally hostile. In 1800, peace in the Ohio Valley was only five years old. After the Revolutionary War, a series of fraudulent treaties were imposed upon the Iroquois and their allies, who had battled to protect their lands. In the South, the Creek and Cherokee had engaged in similar conflicts. Skirmishes between American settlers and American Indian nations continued through the early 19th century, becoming particularly fierce during the WAR OF 1812. The result was that a generation of Americans, living at the boundaries of the existing United States, remembered war with Indian nations from personal experience. They demanded protection from the threat they perceived.

The fusion of these considerations resulted in pressure for Indian removal. ANDREW JACKSON was the president who put the policy into effect. A renowned Indian fighter

who had personally negotiated treaties between the government and the nations of the American Southeast, Jackson was in favor of removal for economic and military reasons. A shrewd politician, Jackson used the rhetoric of reform to further justify his ideas during his presidential campaign. Native American communities must be moved out of the way of white settlement, he argued, in order to give them a real chance to adapt to western ways of life.

While Jackson supported removal, it was events in Georgia that forced him to act on his beliefs. Many of the southeastern nations had made cultural adaptations over the course of the early 19th century, in an effort to nullify criticism of their lifestyles and forestall attempts to remove them. While adaptations took place among each southeastern nation, it was the Cherokee who made the most widespread changes. Indigo, tobacco, and cotton were grown as cash crops, while prominent families built large, plantation-style homes and kept slaves. By 1817, the Cherokee had their own legislature, judicial system, and chief executive, and a written constitution was passed in 1827. Education was readily available at a number of schools, and in 1821 a Cherokee syllabary (vocabulary) was adopted. The Bible was at least partially available in Cherokee by 1824, and by 1828 the nation was publishing a bilingual newspaper, *The Cherokee Phoenix*.

Rather than assuage the concerns of white Americans in the region, however, these changes convinced them that the Cherokee would never give up their lands of their own free will. In order to force the issue, proponents of Cherokee removal pointed to splits in the nation between those who had made cultural adaptations to the world around them and those who had not. The latter suffered grave poverty and alcoholism, and Georgian citizens argued that it was imperative that all Cherokees be removed for their own survival.

The passing of the Cherokee constitution infuriated Georgia's legislators. Claiming that it was unconstitutional for a state to exist within a state, Georgia extended jurisdiction over the Cherokee nation on December 20, 1828. The state gave notice that it would refuse to recognize Cherokee laws or law enforcement and would make Cherokees citizens liable for taxation. These changes would go into effect on June 1, 1830. Newly elected as president of the United States, Andrew Jackson had until that date to resolve the conflict between the two groups.

Jackson's solution was to press forward with removal. In his first State of the Union address, the president committed himself to the policy of moving Indians to the West and urged Congress to act on the matter with haste. By February 24, 1830, the removal bill was out of committee and the subject of bitter debate in Congress. Despite eloquent arguments made in favor of leaving American Indian communities alone, the bill passed the Senate 28-19 on

April 23, 1830, and passed the House 102-97 on May 24. Jackson signed the bill into law that same day.

The Removal Act was used to displace Native American communities across the United States, often by force. The experience of the southeastern tribes was particularly harrowing. Despite appealing their case to the Supreme Court and insisting that the government treat them fairly, the nations were ultimately divested of their lands. Forced to travel to present-day Oklahoma without adequate notice, clothing, food, or transportation, thousands of Indian men, women and children died. The removal process became known as the TRAIL OF TEARS.

## industrialization

Industrialization is the process by which an agricultural society is transformed into one based primarily on large-scale, mechanized factory production. It first occurred in Great Britain in the Industrial Revolution starting in the mid-18th century, and began to spread to the United States in the early 19th century, though a full-scale industrial revolution did not take place there until after the American Civil War (1861–65).

Industrialization in America first took root in New England. The WAR OF 1812 stimulated manufacturing in New England by encouraging reliance on domestic industries rather than those of the British enemy. But just as important was the ingenuity of enterprising textile manufacturers. Britain prohibited export of its profitable textile machinery, but British-born Samuel Slater memorized blueprints and brought them to America, where he and partner Moses Brown built the country's first mechanized cotton-spinning mill, or factory, in Rhode Island in 1790. Soon several mills owned by their firm, Almy, Brown, & Slater, were churning out mass quantities of cotton yarn. As is characteristic of industrial facilities, Slater's mills achieved efficient, inexpensive mass production of goods by using machines worked by large numbers of employees.

In 1814 Francis Cabot Lowell, a Boston merchant, developed the first American power loom, an improved version of English prototypes. With partners, he founded the Boston Manufacturing Company in 1813, the first mill or factory in America to handle all the operations involved in turning raw cotton into finished cloth. After his death in 1817, his partners gave his name to Lowell, Massachu-

setts, a textile manufacturing center incorporated as a city in 1836.

Through operations such as Slater's and Lowell's, the factory system for cotton spinning and weaving became established. It depended on raw cotton from the South, a product that had itself been affected by mechanization: The cotton gin, invented by Eli Whitney in 1793 to separate seeds from fibers, had greatly increased the profitability of cotton farming and made it the basis of the southern economy. By the presidency of JAMES MONROE (1817–25), manufacturing was overtaking shipping as the primary interest in New England and Pennsylvania. By 1840 about 2.25 million spindles were in use in 1,200 cotton cloth factories, two-thirds of them in New England. Woolen manufacturing also advanced during this period, though at a slower pace. By 1850 more than 1,500 wool factories at places like Lawrence, Massachusetts, were producing flannel and blankets.

In addition to textile plants, numerous other kinds of factories sprang up in antebellum America. Near New Haven, Connecticut, Eli Whitney developed a system of interchangeable, standardized parts to mass-produce guns for the U.S. government. The system worked well enough to be widely copied, and Whitney applied it to making clocks. In Delaware, Oliver Evans founded a grist mill that mechanized the entire process from grinding to packing. In North Salem, New York, in 1835, the Howe Company began mass-producing straight pins at the rate of 50 a minute. In Philadelphia, Stuart & Company manufactured hollow ironware while the Disston Company made saws. SAMUEL COLT perfected Whitney's techniques for mass-producing guns in his arms plant at Hartford, Connecticut, where, beginning in 1848, he turned out six-shooters (pistols with six revolving chambers). Other thriving industries in this period included gunpowder, associated with manufacturer Eleuthère Irénée Du Pont; soap and candles, linked with such entrepreneurs as William Colgate and the partnership of William Procter and James Gamble; and rubber, which flourished after Charles Goodyear discovered in 1839 how to vulcanize rubber to keep it elastic in all weathers.

As a result of all this activity, from 1819 to 1849 private production income from manufacturing grew from \$64 million to \$291 million. In 1850, more than \$1 billion worth of manufactured goods were produced in America. In the late 1830s the United States began to export more goods than it imported, a characteristic shift in nations undergoing industrialization. However, manufactured goods remained a relatively small percentage of sales to other countries, accounting for only 12 percent of exports as late as 1860.

Manufacturing in America at this stage was mainly powered by water. The domestic coal industry, essential to steam power, was still developing, as were the iron and steel industries. By 1850 Americans were still importing almost

Showing the power looms of textile manufacture, this label was the early trademark of the Merrimack Manufacturing Company. (*Museum of American Textile History*)

twice as much iron and steel as they were manufacturing at home. But iron production had begun to move out of small blacksmith shops to industrial forges and mills. From 1810 to 1850 the annual output of pig iron increased from 50,000 to 600,000 gross tons. Peter Cooper was among the entrepreneurs who shaped the American iron industry in this period.

In many cases, industrialization was helped by government support. For example, at the urging of textile magnate Francis Cabot Lowell, the tariff law of 1816 imposed duties on imported cotton cloth, aiding the domestic textile industry. Local, state, and federal governments directly or indirectly financed many enterprises through such means as tax exemptions and special franchise and monopoly privileges. Increasingly liberal state laws made it easier for enterprises to obtain financing from banks and to be organized as corporations that could sell stocks and bonds to raise money.

From 1820 to 1840 capital funds invested in the nation's factories increased fivefold, from \$50 million to \$250 million. Much of the capital came from overseas: Up to 1839, the British had invested more than \$170 million in American businesses. The relatively unrestricted flow of capital spurred industrial growth but also contributed to financial instability and devastating panics, or depressions, when confidence in the economy fell, notably the PANIC OF 1819 and PANIC OF 1837.

For industrialization to increase its pace, it was vital to have faster ways to get finished goods to far-flung markets and to get food, supplies, and raw materials to industrial centers. Steamboats, canals, and RAILROADS provided solutions. In 1807 American engineer Robert Fulton launched the first commercially viable steamboat, the *Clermont*, and this mode of transportation was improved and adapted throughout the antebellum years. In 1815 regular steam-

boat service began on the Mississippi River. However, rivers and lakes did not connect every market or production center, so a spate of canal-building began. From 1817 to 1825 the ERIE CANAL was constructed, spanning 365 miles from Albany to Buffalo, linking the Hudson River and the Great Lakes. By 1840 there were over 3,000 miles of canals in the United States. (See CANAL ERA.)

Horse-drawn railways went into operation, such as the Granite Railway in Massachusetts between Quincy and the Neponset River, opened in 1826. But these were only a precursor to the steam locomotive, which was soon everywhere. Industrialist Peter Cooper introduced the first U.S.-built locomotive, the *Tom Thumb*, in 1830, the same year that the BALTIMORE & OHIO RAILROAD (B&O), based in Baltimore, began using steam locomotives for rail service. Other railroads followed quickly, linking cities along the eastern seaboard to each other and the West. The Pennsylvania Railroad was chartered in 1846; the Pacific Railroad Company, the first railroad west of the Mississippi, was begun in 1849; and the New York Central Railroad was started in 1853. By 1850 there were more than 9,000 miles of railroad track; by 1860, about 30,000 miles. Railroad manufacturing itself became an important industry, as factories were established to build locomotives, car parts, and track. The telegraph, demonstrated by SAMUEL F. B. MORSE in 1844, became important in scheduling and dispatching trains, as well as in facilitating other kinds of business communications.

Improved transportation was useful not only for shipping goods, but for moving people. By steamboat or train, as well as by older modes of transport, rural residents and new immigrants migrated to urban centers to take up jobs in factories. During the 1840s alone, towns and cities of 8,000 or more people grew by 90 percent, a much faster rate than the U.S. population as a whole, 36 percent. Between 1820 and 1850 the combined population of Baltimore, Boston, Philadelphia, and New York more than tripled to 1.2 million. The state of transportation was such that daily commutes over long distances were still difficult to manage, so company towns, built to house workers, sprang up around mills.

Farm mechanization freed laborers for factory work while also ensuring enough food for the growing cities. In 1831 CYRUS HALL MCCORMICK invented a mechanical, horse-drawn reaper that dramatically improved the efficiency of harvesting. In 1838 JOHN DEERE began manufacturing steel plows, which was an improvement over iron plows and initiated a new industrial empire, that of Deere agricultural equipment.

As is usual with nations undergoing industrialization, the economy grew and per capita income rose, but it did not do so equally. It is estimated that the share of wealth owned by the top 1 percent of Americans grew from 13

percent in 1774 to 29 percent in 1860. In Boston from 1833 to 1848 alone, the share of wealth held by the top 10 percent grew from 75 percent to 82 percent, while the share owned by the bottom 80 percent fell from 14 percent to 4 percent.

Industrialization lowered prices for many goods, making them more available to the middle and lower classes and so improving their standard of living. Wages were relatively high at first, especially for skilled mechanics who understood or could learn how to repair and build machines. American factories attracted immigrants by paying wages that were a third to a half higher than were available in Europe. But as more workers became available, wages fell. Men in general earned more than women or children: Men in Massachusetts earned \$5 a week, women \$1.75–\$2.50, and children \$1–\$2.

Working conditions were often hard. Factory workers typically toiled from dusk to dawn for 11–13½ hours a day. The Lowell Mills, under the influence of British socialist Robert Owen, offered a neat, educational, chaperoned environment for the young women who worked there as “factory girls.” But working conditions in other factories were not so attractive. In the company towns of New York and Pennsylvania, workers had to buy what they needed at company-owned stores, frequently going into long-lasting debt to their employers.

The factory system was rapidly making domestic craft labor obsolete. Before industrialization, most manufactured products had come out of the homes and workshops of skilled artisans. Cloth manufacturing, for example, had been done at home, in domestic weaving operations where the worker owned her own tools. Increasingly, domestic enterprises were replaced: by 1840, more goods were manufactured in mills than in homes and workshops. However, in many businesses, such as boot- and shoe-making, skilled craftsmanship and domestic manufacturing remained the norm until after the Civil War.

Even as workers carried the burden of industrialization, capitalist entrepreneurs prospered. Whereas wealth before the 19th century had been primarily measured by land ownership, industrialists such as Lowell, Cooper, Du Pont, Colt, and Colgate made fortunes. By the 1840s, the phrases “millionaire” and “labor union” had both entered the American lexicon, an indication of the development of new social classes and of the growing struggle between them. In the 1830s, textile and craft workers organized to demand a 10-hour day. From 1834 to 1837, union membership grew from 26,000 to hundreds of thousands.

The benefits of manufacturing were distributed unequally by region as well as class. The North was far more heavily industrialized than the South, particularly in the Northeast, site of the first textile factories in New England; and in the Midwest, where Cincinnati, Chicago, and

St. Louis became industrial centers by the 1850s, providing manufactured goods for settlers. In the South, however, the heavily agricultural economy was centered on cotton farming, with slaves picking cotton to be shipped north to be spun and woven into textiles.

By the end of the antebellum period, the majority of American workers were still on farms, but industrialization was clearly in the ascendancy. The proportion of American workers engaged in AGRICULTURE declined from 71.8 percent in 1820 to 68.6 percent in 1840 and to 58.9 percent in 1860. By 1849, private manufacturing income amounted to an eighth of total national income from private sources, with manufacturing the economy’s most rapidly growing segment. The pace of industrialization quickened even more from 1860 to 1890. By the late 19th century, the United States was the world’s largest industrial power.

## Interior, Department of

The Department of the Interior, a cabinet-level office of the federal government’s executive branch, was established by an act of Congress on March 3, 1849. The department was originally organized to bring together many of the government’s disparate procedural responsibilities. A number of independent offices and bureaus, as well as large departments such as the Department of State and the Department of War, had been in charge of such tasks as patent registration, census administration, supervision of federal buildings, oversight of Indian affairs, enforcement of land laws, and the administration of military pensions. All these areas were reorganized under the auspices of the new Department of the Interior.

Over time, the department’s mandate has changed. Today it is responsible for the protection and use of the United States’ natural resources, national parks, historic sites, and wildlife. While many of its original responsibilities have now been given over to other federal agencies, the BUREAU OF INDIAN AFFAIRS remains within the Department of the Interior, as it has since 1849.

### internal improvements

By the beginning of the 19th century, Americans began to advocate for the construction of new transportation routes in order to facilitate western settlement and efficient trade. These “improvements” on the natural landscape—roads, canals, bridges, turnpikes, and, later, RAILROADS—would allow Americans to take advantage of the abundant resources in the West. Proponents also argued that, by connecting different regions, these improvements would create a more unified and prosperous nation. By the 1830s, enthusiasm for the transformative power of internal improvements was widespread, as various states and the federal government planned new transportation projects.

In newly settling western states, officials thought that they could encourage rapid development by building canals and roads, thereby providing access to huge tracts of federally owned land. Once transportation routes had been provided, settlers would be more likely to buy tracts in these unsettled areas. The sooner these areas were settled, the sooner the state could become solvent via a substantial tax base. With increased revenue, still more infrastructural improvements could be started.

Beginning in the first two decades of the 19th century, the first major improvement to receive federal support was a system of toll roads or turnpikes. By 1810, approximately 300 turnpike companies had been chartered in the Mid-Atlantic states and New England. By the 1820s, all major northern cities were connected by roads; in the South, efforts to improve transportation routes would proceed much more slowly. But how would roads be established in the new western territories? Thomas Jefferson’s original grid plan for western settlement did not include space or provisions for roads. Congress began to rectify that oversight in 1802 and 1803. In the acts that admitted Ohio as a state, members of Congress placed stipulations requiring that 5 percent of the proceeds from the sale of public lands be used to build roads in the state. These funds financed construction of the Cumberland Road, also called the NATIONAL ROAD. This western road would begin in Cumberland, Maryland, then go to Wheeling, Virginia, then on to Columbus, Ohio, and then Indiana, terminating in Vandalia, Illinois. The plan for the National Road was approved in 1806, with the Army Corps of Engineers responsible for surveying and constructing it. Actual construction began in 1811, and the road reached Wheeling by 1818, Columbus by 1833, and Indianapolis by 1850. At this point, the federal government handed over funding and construction to the states through which the road would run. In thinly

populated states like Wisconsin, Michigan, and Indiana, settlers asked the federal government to help build other roads. The government offered land grants to construct three roads in this region. Slowly, a system of smaller roads developed that connected larger areas to the main arteries. In the trans-Mississippi West, most roads were constructed by military forces as part of their efforts to impose white settlement and contain Native American populations. These efforts were assisted by the INDIAN REMOVAL ACT, which became official federal policy in 1830.

The evolving road system was heavily traveled, but maintaining it was difficult and expensive. Enthusiasm for completing the National Road project diminished as roads became more common, and less-cumbersome transportation methods, such as canals, emerged.

Thus, the second great improvement initiative centered around the construction of artificial waterways, or canals. Although costly and difficult to build, canals were supposed to be quicker and easier routes than the bumpy, muddy roads. The stunning success of the ERIE CANAL in New York encouraged other states to view canals as an essential element of development. State officials hoped these canals would promote rapid settlement in the Northwest and strengthen regional economies. While the Erie Canal was state-funded, most of the canal projects in the West relied more heavily on federal support and private funding, because the new states had few sources of capital. One of the few states to succeed on the New York model, Ohio began to construct a canal system the year before the Erie Canal was completed.

By 1833, 341 miles of canal had been built from Portsmouth (on the Ohio River) to Cleveland, and from Cincinnati to Dayton. As hoped, this canal system raised land values and increased settlement and commerce. Other projects meant to connect the Northwestern states to the Great Lakes through lateral canals were not completed until the 1830s, when the states were finally able to borrow the money they needed for construction. Still, many states defaulted on loans they had taken out to build canals. The PANIC OF 1837, along with risky and unsound planning, caused many improvement projects to fail. Nevertheless, traveling by canal or by Robert Fulton’s new steamboats was the fastest, most efficient method of transportation until the 1840s, triggering rapid development in the trans-Appalachian West.

Railroads displaced canals as the favorite internal improvement by the 1850s. Faster and more versatile than canal or river travel, railroads became the major carriers of people and goods to and from the West. The first railroad companies, such as the Mohawk and Hudson Railroad (1826), connected coastal cities and seaports with the surrounding regions. The first American rail company to reach over the Appalachians, the BALTIMORE & OHIO RAILROAD

(B&O) was chartered in 1828 and began running trains in 1830. Construction to Wheeling was completed by 1852. The Chicago and Rock Island Railroad reached the Mississippi River in 1854, connecting this crucial river system with the Great Lakes region for the first time. Other important early railroads include the New York Central Railroad; the Chicago, Burlington, and Quincy Railroad; the Chicago and Northwestern Railroad; and the Chicago, Milwaukee, and St. Paul Railroad. Just as the Erie Canal had transformed New York City into the most important American seaport, the railroad system made Chicago the center of the expanding western market. While the whole nation would not be connected from sea to sea until 1869, railroads were well on their way to transforming space, time, and production before the Civil War.

Throughout this period of infrastructural expansion, Americans contended with a key question: Who should fund these improvements—private parties, states, or the federal government? Officials debated whether the federal government should be financing such projects, since the Constitution did not specifically name internal improvements as a federal responsibility. HENRY CLAY and other Whig proponents of the AMERICAN SYSTEM argued that federal funding for improvements was necessary for the nation to grow economically strong. In order to reach a compromise with Democratic opponents (among them President ANDREW JACKSON), Clay proposed that the proceeds from land sales be distributed to the states, where they could then use this money to build improvements. A similar plan proposed by JOHN C. CALHOUN was eventually passed in 1836, making \$28 million available to states to build improvements. Before this point, some projects had been funded federally, others by the states or private parties.

In 1841 Congress tried to equalize the federal contributions to state road construction. Through the Distri-

bution-Preemption Act, Congress granted half a million acres of public land to every state that had not yet received federal money for constructing internal improvements. Less-populous western states were angry about the distribution method, which granted funds based on population figures. But preemption rights, or giving settlers already on the land the right to purchase that land first, was a welcome change in the law. The distribution requirement was eliminated in 1842. Some states used the half-million acre grant to complete existing canal and road projects; others used the acreage to begin building that most revolutionary 19th-century improvement, railroads. In 1850 Congress began to grant lands specifically for railroad construction, usually by designating alternate sections along a proposed route.

In the first half of the 19th century, the craze for internal improvements exemplified high hopes about the nation's future growth and a commitment to rapid economic expansion in many segments of American society. The antebellum debate over how to accomplish internal improvements reveals concerns over the role of government in promoting the economy that still divide Americans today. The first improvements in road, canal, and rail construction provided the initial transportation web that enabled Americans to spread throughout the continent and begin connecting regions together in trade networks.

**Jackson, Andrew** (1767–1845) *seventh U.S. president* Seventh president of the United States and the first president who did not reside in one of the original thirteen colonies, Andrew Jackson was a frontier general and Indian fighter. Elected president on a platform that anointed him as the candidate of democracy and the common man, he served two terms of office (1829–37) that were marked by bitter controversies over states' rights, the tariff, the spoils system, Indian removal, and banking policies. A man of volatile temperament and strong convictions, Jackson used his presidential power vigorously and left his mark on the era.

The period of Jackson's influence, approximately 1820–45, has been dubbed by many historians as "The Jackson Era," or "The Age of Jackson." This was a time of rampant economic, political, and social growth, as the market economy burgeoned with revolutions in transportation and manufacturing, and westward expansion took place at an amazingly fast pace. Regional diversification was the result of much of this expanding economy, but so was regional separation and enmity; the views of North and South moved toward diametrically opposed positions regarding matters of states' rights and the expansion of SLAVERY.

The child of poor Scots-Irish immigrants, Jackson grew up in the backcountry of the South Carolina-North Carolina border, where he attended frontier schools. He was orphaned during the American Revolution when his widowed mother died of smallpox. Although still a boy, Jackson participated in the war as a messenger and orderly. Afterwards, he set himself up as a saddlemaker and sometime schoolteacher on the South Carolina frontier. He eventually moved to Charleston and then to North Carolina, where he read law and gained admission to the bar. In 1787 Jackson established a law practice and soon became a successful lawyer and land speculator. Shortly thereafter, he migrated to Nashville, Tennessee, where he became involved in politics.

In 1791 Jackson married Rachel Donelson Robards. This was Rachel's second marriage, which was risk enough to an aspiring politician during this period. However, when it was learned that no divorce from her first husband had ever been granted, it became a personal and political nightmare for the Jacksons. After Robards's divorce, they remarried in 1794, but the damage had already been done. Gossips and political opponents attempted to make a scandal out of Jackson's happy marriage. While Rachel suffered the slanders in silence, Andrew often preferred to use dueling pistols to avenge his wife's honor.

Jackson served as a delegate to the Tennessee constitutional convention in 1796 and as congressman from Tennessee (1796–97). His congressional career was undistinguished, marked primarily by his fierce opposition to the Washington administration's conciliatory stance toward Great Britain and the western Indian nations. He was elected U.S. senator in 1797, but financial problems forced his resignation and return to Tennessee in less than a year. After serving as a Tennessee superior court judge (1798–1804), he retired from the bench to devote all his energies to business ventures and to his plantation, the Hermitage, near Nashville. His political career seemed to be over, as his efforts to gain appointment as governor of Louisiana were rebuffed by President Thomas Jefferson.

The WAR OF 1812 changed his political fortunes. In March 1814, assisted by Native American allies, Jackson crushed CREEK resistance at the BATTLE OF HORSESHOE BEND. As terms of surrender, he demanded and got enormous tracts of land ceded by Indians—friend and foe alike—in both Alabama and Georgia. This stunning victory impressed the federal government sufficiently to place him in command of the defense of New Orleans, which "Old Hickory," as Jackson was called by his admirers, swiftly organized. On January 8, 1815, his forces completely routed an invading British army, unaware that Britain and the United States had signed a peace treaty several weeks earlier.

Andrew Jackson (*National Archives*)

Jackson's victory at New Orleans, coming at the end of a war marked by military ineptness and humiliating defeats by the United States, was seized upon widely by an American public hungry for vindication of national honor. Not even the news that the war had been officially over could diminish the national fervor attached to its new hero. The BATTLE OF NEW ORLEANS had made Andrew Jackson a legend—a symbol of American virtue and power.

General Jackson continued to add to his legend during subsequent years. After pursuing the Seminole Indians into FLORIDA (a Spanish possession) in 1818, Jackson exceeded his authority when he deposed Spanish authorities and executed two British subjects. This brought about the U.S. acquisition of Florida in 1819. Not only did Jackson avoid censure and dismissal for his actions, he was appointed territorial governor of Florida in 1821.

A traditional westerner, pro-tariff and pro-internal improvement, Jackson became a presidential candidate in 1824. The demise of the Federalist Party, long out of presidential power and now discredited by its opposition to the War of 1812, had left the nation, for all practical purposes, with a one-party system in 1824. The Demo-

cratic-Republicans were unable, however, to agree on a common presidential candidate. Riddled with factions, the party put four major candidates on the ballot: William H. Crawford of Georgia, Henry Clay of Kentucky, Andrew Jackson of Tennessee, and John Quincy Adams of Massachusetts.

Jackson won the popular vote but not a majority of the electoral vote, forcing the election to be decided in the House of Representatives. Henry Clay released his electoral votes to Adams in return for Adams naming Clay secretary of state. Adams won the election by a one-vote margin. The deal struck between Adams and Clay became referred to as the "corrupt bargain," and many thought Jackson had been robbed of the presidency. The public outcry was strong, and the stigma would haunt Adams's presidency; it would be instrumental in allowing him only a single term.

Capitalizing on the public and political outrage over the Adams-Clay "corrupt bargain," MARTIN VAN BUREN, a staunch Jeffersonian Republican, put his formidable skills as an organizer to work and began to forge a national alliance between the Democratic-Republicans of the North and the planters of the South. Because of these changes, the Democratic-Republicans became known as the Democratic Party, which nominated Jackson as their candidate for president in 1828.

Critical of Adams's nationalist policies and lack of concern for states' rights, the Jackson organization represented Old Hickory as a champion of the common man. They attacked Adams and Clay for the "corrupt bargain" that, they alleged, revealed the aristocratic principles of both men and their contempt for democracy. Adams's supporters in turn attacked Jackson for the irregularity of the first years of his marriage and portrayed him as an ignorant and uncouth barbarian. Yet the Jacksonian Democracy was triumphant in 1828. In an election marked by mudslinging and character assassination on both sides, Jackson defeated Adams's bid for a second term.

Jackson's victory was marred when Rachel Jackson died of an apparent heart attack soon after the election. While the occasional local reference to the "bigamist" Rachel had occurred over the years, for the most part the Jacksons' marriage scandal blew over until the 1828 election, when Adams tried to raise the old slurs and gossip for his advantage. Jackson was convinced that his wife's death was the fault of Adams and his administration, and he never forgave them for it. As president, Jackson introduced the spoils system into national politics, which rewarded party loyalty and service with political offices. The system, with its official label of "rotation in office," was hailed by Jackson as a Democratic device for allowing the common man a voice in the government. In any event, he relied more heavily on his "Kitchen Cabinet" of personal advisers than he did on his official cabinet.

In 1830 Jackson signed the INDIAN REMOVAL ACT, which called for the general resettlement of Indians to lands west of the Mississippi River. The following year, the Supreme Court ruled in *Cherokee Nation v. Georgia* that the CHEROKEE were not a “foreign nation” within the meaning of the Constitution, but a “dependent nation.” This essentially made the Indian Removal Act of 1830 unconstitutional. Undaunted, Jackson was reputed to have said, “[Chief Justice] John Marshall has made his decision. Now let him enforce it.” The decision was ignored, and between 1831 and 1839 the Five Civilized Tribes of the Southeast (CHOCTAW, CHICKASAW, Cherokee, Creek, and SEMINOLE) were forcibly relocated to Indian Territory (Oklahoma). On the TRAIL OF TEARS, thousands of Native Americans perished in this removal. Henry Clay called Jackson’s Native-American policy “a stain on the nation’s honor.” However, Jackson’s antipathy toward Indians was typical of the frontier mindset, and because this policy opened more land to settlement, a majority of the public and Congress supported it with enthusiasm.

In December 1831 the National Republicans once again nominated Henry Clay for the presidency. Clay, senator from Kentucky, returned to the national spotlight feeling pessimistic about his chances against Jackson. His main goal was to bring a measure to Congress that would put the administration in an embarrassing position. He therefore proposed a modification of the tariff, lowering it but leaving the protective elements in. By lowering revenues, this would have put off Jackson’s intended repayment of the national debt by nearly a year. If the president vetoed it, he would alienate northern states, like Pennsylvania, whose votes he needed. If he signed it, it would alienate his southern supporters. In the end, Clay’s strategy failed when Congress passed a bill moderate enough that Jackson could sign it without alienating either faction.

The election of 1832 marked the first time that presidential candidates were chosen by party conventions. The chartering of the SECOND BANK OF THE UNITED STATES was the most important campaign issue. The National Republicans, with Henry Clay as their candidate, supported the bank, while Jackson and the Democrats were adamantly opposed to it. Jackson won a second term easily.

Before Jackson entered his second term, South Carolina threatened nullification of the tariff of 1832. Although Jackson was a champion of states’ rights, he always stood firm behind the supreme powers of the federal government in any struggle that placed the interests of a state above those of the Union. He therefore made it clear that he considered a state’s nullification of a federal law to be unconstitutional, inconsistent with the principles and spirit on which the union was founded, and destructive to its continued existence. Jackson also pushed through Congress a

force bill that authorized the use of federal troops to collect the tariff.

The crisis was eased when Henry Clay promoted a compromise tariff in 1833 along with the force bill. As a last defiant gesture, South Carolina accepted the tariff but nullified the force bill. Jackson had preserved the Union, but NULLIFICATION remained a great question.

In spring 1833 Jackson embarked on a tour of the country, mostly in the Northeast, where pro-Union sentiment was especially strong. He was greeted by huge cheering crowds wherever he went and received an honorary doctorate of law from Harvard, to the disgust of John Quincy Adams. He finally had to cut the trip short because of “bleeding at the lungs,” at least partly due to a bullet he had carried in his chest for more than 20 years (the result of a duel).

At this height of his popularity, Jackson set out to ensure the demise of the Second Bank of the United States. He spent the summer of 1833 looking for banks into which federal deposits could be made should they be withdrawn from the Bank of the United States. As the withdrawal of funds went forward, the bank began a severe tightening of funds, restricting loans, and calling in as many debts as it could. This caused a financial panic resulting in an economic recession.

As the recession continued and deepened in 1834, the country became more polarized. It was during this period that the National Republicans became the WHIG PARTY. This name conjured the ghost of the antiroyal, pro-Parliament, English factions of the 17th and 18th centuries. In that spirit, Whigs labeled Jackson “King Andrew I” and drew political cartoons depicting him as a king, with a scepter labeled “Veto.”

Before 1834 was over, many former friends of the Second Bank became disgusted at its conduct, and in the end, the Bank of the United States was stripped of the funds the government had placed in its keeping. It lost its friends, including Clay, and quietly lost its standing as a national bank. Rechartered as a state bank in Pennsylvania, it only lasted a few years more.

Jackson lived to the age of 78, despite chronic sickness and a bullet in his chest, and died peacefully at home on June 8, 1845. His era had radically changed the American party system and methods of electioneering. The firmness and arguably violent nature of his positions and actions gave birth to a strong new opposition, the Whigs. He left the presidency much stronger than it had been, and he strengthened the notion of the United States as a nation rather than a number of states with an agreement to act in concert.

## journalism

During the first half of the 19th century, technological advances, the growing U.S. population, an emerging market economy, and a widespread egalitarian sensibility brought tremendous growth to the popular press. Between 1830 and 1840 alone, the urban U.S. population increased by over one-third to 1.5 million; the number of weekly newspapers swelled from 650 to 1,141, and daily newspapers increased from 65 to 138.

Nearly all of these papers were inexpensive journals called “penny papers” such as the *New York Journal*, which drew a large circulation of two to five times as much as an 18th-century paper. Antebellum magazine readership also grew markedly, with the *Godey’s Lady’s Book* reaching the highest circulation—150,000 by the end of the 1850s.

While traditional newspapers continued to be published, they were eclipsed in number and importance by penny papers. These self-proclaimed democratic publications gained popularity by serving all members of society and by offering a variety of up-to-date information that came to be known as “news.”

### Newspapers

From the 18th century into the 1820s, most newspapers were relatively expensive items that cost a few pennies—usually six cents—and were sold by subscription to a select portion of society, the mercantile class and political leaders. These papers depended on political parties, not commercial advertising, to support them. Popular newspapers of the era included the *Boston Daily Advertiser* and the *Baltimore Daily Advertiser*.

Reflecting their audience, subscription newspapers held definite views on what were considered proper topics for coverage and advertising. Among them were business-related segments such as stock listings, ship dockings, and foreign reports; political information consisted largely of

editorials, which favored the party supporting the newspaper. Considered unfit for the paper were topics concerning everyday life, from local problems to crime. Also improper were advertisements for personal products and services as well as entertainment.

During the 1830s, the look and content of newspapers were transformed with the introduction of the commercially driven “penny paper.” Unlike the six-cent paper, this newspaper was priced at a penny. Not underwritten by political parties, it accepted advertising to pay for itself. It was also not sold by yearly subscription to those who could afford it, but rather bought on the streets by all social classes. It was particularly favored by middle-class urban dwellers—shopkeepers and salesmen, for example—who bought the paper from roaming child vendors known as newsboys.

Within months of their introduction, the penny papers’ circulation more than doubled subscription paper rates and became the cities’ primary sources of information and idea exchange. In New York, 11 penny papers were available by 1835; among the most influential were New York’s *New York Sun* (founded 1833), *Evening Transcript*, and *New York Herald* (both 1835). Other notable urban newspapers included Philadelphia’s *Philadelphia Public Ledger* (1836), Boston’s *Boston Daily Times* (1836), and Baltimore’s *Baltimore Sun* (1837).

Who ran the penny papers and what did they contain? Many of the founding editors of the penny papers were entrepreneurial businessmen whose newspaper ownership reflected the increasingly heterogeneous society in which they lived. Among them were James Gordon Bennett, who controlled the *New York Herald* (1835), the most widely read penny paper in the United States and Europe. Bennett founded the paper in 1835 on \$500 and simple goals: to concentrate on news reporting but aim it, in his words, “to interest the merchant and man of learning, as well as the mechanic and the man of labor.” Politician and veteran newspaper editor Horace Greeley founded the *New York Tribune* in 1841 and distinguished it from competitors through its eclectic views, which included abolitionism, women’s rights, and nationalism. Influential in shaping public opinion, the *Tribune* was also known for such writers as MARGARET FULLER and Karl Marx, who was a foreign correspondent.

Other notable editors included Benjamin Day, founder of the *New York Sun*, whose newspaper grew to a readership of 10,000 within months of its 1833 founding. Day was also known for his early use of newsboys to sell papers. Borrowing from the London practice of selling newspapers on the street, Day sold boys and girls copies of 100 papers wholesale (at 67 cents) or on credit (at 75 cents); the street sellers then sold papers at a profit to readers.

Amidst the general-interest newspapers were several important specialized papers arising during the period.

Representing the African-American audience was the pioneering black-press-published *Freedom's Journal*, founded in 1828 by the Reverend Samuel E. Cornish and John B. Russwurm. Before ceasing publication in 1831 (under the name *Rights of All*), the newspaper championed the antislavery movement and contested black stereotyping in other newspapers. Abolitionist William Lloyd Garrison inaugurated his weekly newspaper *The Liberator* in 1831. Campaigning in print against SLAVERY and other social ills, it generated violent public response before it ended publication in 1865.

Influential as specialized newspapers were, they did not have the large audience of the general-interest penny-press newspapers. In part, this was due to the overriding aim of most penny papers: to appeal to the widest possible audience by following no set political views and being non-partisan in reporting. While some papers, such as the *New York Transcript*, initially professed disinterest in political issues, most, like the *New York Tribune*, pledged itself to covering the broad world of politics and local events. This shared stance of the penny papers marked the beginning of modern-day news coverage: the timely, accurate, and adept presentation of events.

As reporting of news events increased in the penny papers, the importance of the editorial page of opinion declined. A central element of the six-cent paper, the editorial page had previously been written for a circumscribed audience. Such a set opinion would not represent the varied penny-press audience. Instead, accuracy and timeliness became the impartial standards by which a heterogeneous audience judged a newspaper.

The up-to-date information required for the penny paper sharpened the role of the news reporter. Rather than reprinting a political speech as was done in six-cent papers, penny-press newspapers unearthed news. They did so through the innovative practice of assigning reporters on regular assignments or beats, or postings at foreign locations. For example, by the mid-1830s New York papers established reporters on regular court, police, sports, and society duty; others were stationed domestically in Washington, D.C., in eastern cities, and in Europe.

In addition to offering reporting from specified beats, some penny papers offered analyses of important issues. Pioneered by the *New York Tribune*, these writings, notably what became known as the “money articles,” provided original analysis and business speculations for readers who might otherwise have shunned the inexpensive paper. Through this coverage, penny papers came to represent varieties of everyday life, from marriages to habits of political and cultural leaders to analysis of economic trends.

Central to the proliferation of the popular press were the technological and transportation advances that improved the speed and efficiency of the printing and delivering of

periodicals. Printing advances had been improving the speed and quality of printing since the early 19th century and entered domestic use in 1823, when the European-based steam-driven press was first used to print U.S. books. Simultaneously, printing for major newspapers and other periodicals was also being adapted to the cylinder press, which was first used in 1835 by the *New York Sun*. After being refined into a two-cylinder version, it was used to print a newspaper, the *Philadelphia Public Ledger*, in 1847, and gained widespread use shortly after the Civil War.

Making fast newspaper delivery possible was the growth of the railroad across several states during the antebellum years. Between 1830 and 1850, several thousand miles of train track were laid over several states, a vast increase from the several dozen miles of track laid in the 1820s.

Another technological development increased the speed of information delivery and raised questions about the content of reporting: the telegraph. Invented in the 1840s, the telegraph made it possible to transmit news by wire nationwide. In an early application, the telegraph was particularly useful to penny papers in delivering news during the MEXICAN-AMERICAN WAR (1846–48).

To provide the largest number of newspapers with this timely information, several New York-based newspapers formed the first wire service, the Associated Press, in 1848. To resolve the problem of how to present the information to varying newspapers, the Associated Press reported news without political slant or commentary. Other similarly objective wire news services followed, including United Press (later United Press International).

Another change in newspapers was its source of financial support. Unlike its subscription predecessors, the penny paper paid for itself through commercial advertising. No longer limiting its advertising sources, penny papers accepted ads from various commercial sources, including personal products and popular entertainments. Summarizing the common penny-press position, one paper wrote, “It is sufficient for our purpose that the advertisements are paid for, and that . . . we are impartial, and show no respect to persons, or to the various kinds of business that fill up this little world of ours.”

### Magazines

To a lesser extent during this period, magazines also gained wider readership and influence. The 19th century began with the dominance of literary and political journals such as *The Monthly Magazine and American Review* (1799) and *The American Register* (1807), both founded by Charles Brockden Brown; and the Federalist *Port Folio*, edited by Joseph Dennie (1801).

Founded in 1815, the intellectual journal the *North American Review* was an early champion of American

letters and the most influential journal of its kind until the mid-19th century. Contributors included Henry Wadsworth Longfellow and historian Francis Parkman; editors included clergyman Edward Everett and historian John Palfrey. Other notable journals of the 1820s included *American Quarterly Review* (1828).

The introduction of penny-press newspapers and the technology that accompanied them gave rise to a new kind of periodical, the general circulation monthly magazine. Influential representatives of the era included *Graham's Magazine* (1826). Founded by Samuel C. Atkinson and Charles Alexander as the *Casket*, it gained dominance under the editorship of George Rex Graham, who changed the magazine's name and paid unprecedented fees for contributions by important writers, such as James Russell Lowell and RICHARD HENRY DANA. Also prominent during the era, particularly in New York, was the *Knickerbocker Magazine*, founded in 1833 and edited by Washington Irving.

Also gaining popularity was the diverse regional weekly, which was designed to offer a wide range of information for weekend readers. Prominent among these entries was the *Saturday Evening Post*. Founded in 1821 by Charles Alexander and Samuel Atkinson, it became hugely popular in the 1840s and 1850s after incorporating the magazine the *Saturday Bulletin* in 1832 and including popular serial fiction.

Notable antebellum literary quarterlies included the literary magazine the *Dial* (1840), which represented the thinking of the TRANSCENDENTAL MOVEMENT through its contributors and editors RALPH WALDO EMERSON and Margaret Fuller. Southern writing was represented in *The Southern Review* (1828) and the *Southern Quarterly Review* (1842).

Political magazines during the period were often distinguished by their regional views. Reflecting northern attitudes were the *Democratic Review* (1837), which featured noted writers of the day including Nathaniel Hawthorne; and *Niles' Weekly Register*, a newspaper digest. Southern views were presented in the *Southern Literary Messenger* (1834) and *DeBow's Review*, the former edited for two years by Edgar Allan Poe.

Female readers were considered an important, separate group that was represented largely by *Godey's Lady's Book* (1830). Reaching an audience of 40,000 readers, *Godey's Lady's Book* was the most influential women's magazine during the pre-Civil War years and beyond. Founded by Louis A. Godey, it was driven by SARAH JOSEPHA HALE, who became its editor in 1836. In addition to shaping opinion on fashion and matters of domestic life, it

published works by leading writers including Edgar Allan Poe and Ralph Waldo Emerson. In later years, Hale and the magazine were central to establishing Thanksgiving as a national holiday. *Godey's* closest competition was *Peterson's Ladies' National Magazine* (1842).

Another magazine that proved influential after the Civil War was founded in 1855 by Frank Leslie. Combining the magazine *Frank Leslie's Ladies Gazette of Fashion and Fancy Needle Work* and the *New York Journal*, a newspaper, he founded *Frank Leslie's Illustrated Newspaper*, a hybrid of periodical and newspaper that would become known for its timeliness and colorful writing.

Aside from the observable changes of INDUSTRIALIZATION and the growth of the urban population, newspapers and periodicals during the 19th century grew in popularity for an intangible reason: The U.S. public considered newspapers important on a personal basis. As a more democratic, commercial ECONOMY developed, newspapers and periodicals became significant items that an up-to-date household could acquire.

Along with this attraction to periodicals came a growing skepticism at the press's aims. Nearly two centuries before current critiques of the media, author and critic James Fenimore Cooper perceived the problem. In his 1838 nonfiction work *The American Democrat*, he wrote, "If newspapers are useful in overthrowing tyrants, it is only to establish a tyranny of their own. The press tyrannizes over publick [sic] men, letters, the arts, the stage, and even over private life."

At the same time, the American press was coming to view its own role as central to promoting democracy. Unlike subscription papers of the past, whose titles reflected their business or political ties, papers founded in the mid-19th century bore names such as the *Beacon* or *Herald* that looked outward to the wider world. As the *Baltimore Sun* promised, "Our object will be the common good, without regard to that of sects, factions, or parties; and for this object we shall labor without fear or partiality." The ideal of the honorable presentation of knowledge has clung to newspapers for two centuries.

## **Kamehameha I** (ca. 1753–1819)

Historians are uncertain when and under what circumstances Hawaii's great warrior king and national unifier was born. The year ranges between 1753 and 1758. According to legend, Kamehameha's mother, Kekuiapoiwa, gave birth to the future king on the island of Hawaii (the "Big Island") in secret because *kahunas* (Hawaiian shamans) prophesied that he would grow up to slay his rival chiefs and rule the HAWAIIAN ISLANDS. To protect her son from the murderous plots of chiefs who saw the infant as a threat, Kekuiapoiwa entrusted Kamehameha to a faithful servant. Kamehameha was raised in relative isolation, and because of this he acquired the nickname "the Lonely One."

Kamehameha proved himself to be a ferocious, intelligent, and successful warrior. When the great chief of the Big Island and Kamehameha's uncle, Kalaniopuu, died, he passed his kingdom on to his son Kiwalao. However, he made Kamehameha the keeper of the family war god. The result of this was jealous rivalry between cousins. Kamehameha began a war against his cousins Kiwalao and Keoua for dominance of the Big Island; it lasted almost nine years. The result of this warfare was a shaky truce between Kamehameha and Keoua; Kiwalao was killed in battle.

By the 1780s, the Hawaiian Islands were divided roughly into three kingdoms. The Big Island and a small portion of Oahu were under the rule of Kalaniopuu and his heirs. The chief Kahekili ruled the rest of Oahu as well as the islands of Kahoolawe, Lanai and Oahu. His brother Kaeo had control over Kauai. As Kalaniopuu's heirs were struggling for power on the Big Island, Kahekili conquered Kalaniopuu's portion of Oahu and gained influence over Kauai through family marriage. Power in the islands was at a deadlock, and only the arrival of westerners and their technology tipped the balance in Kamehameha's favor. The Lonely One made an immediate and lasting impression on

British captain James Cook and other westerners he met. According to one of Cook's officers, Kamehameha had "as savage a looking face as I ever saw, it however by no means seemed an emblem of his disposition, which was good natur'd & humorous."

Following a fatal encounter between Hawaiians and an American vessel, which occurred shortly after Cook's death in 1779, Kamehameha took two sailors, Isaac Davis and John Young, prisoner. He also captured their vessel, the *Fair American*. The two sailors were soon won over by Kamehameha's humane treatment and, with the *Fair American's* cannons, helped him vanquish his rivals and gain control over the entire archipelago. By 1796, Kamehameha was the undisputed ruler of all the major islands of Hawaii. The entire chain fell under his sovereignty in 1810 when Kauai, which was nominally independent, and Niihau submitted entirely to him.

Under Kamehameha's rule, which lasted from 1796 to his death in 1819, Hawaii flourished in peace and enjoyed its last period of traditional Polynesian culture and society. The political economy resembled European feudalism with the *ali'i* (warriors) and the *maka'ainana* (peasants) functioning as vassals and serfs respectively. The *kahunas* served in significant positions as advisers and doctors. The Lonely One also enacted laws that gave greater equality to commoners by restricting their exploitation at the hands of the nobility. Finally, under Kamehameha, Hawaiians lived according to the traditional *kapu* system that regulated daily life, family relations, divisions of labor, and gender dynamics. Kamehameha made Lahaina, on the island of Maui, the royal court. The monarchy he established would continue for another 100 years. However, as more westerners came to settle in the islands after 1819, particularly whalers and missionaries from the United States, the Hawaiian society Kamehameha created would gradually give way in almost every respect to American political, economic, and cultural dominance.

**Kearny, Stephen Watts** (1794–1848) *U.S. Army officer, American explorer*

An American general in the Mexican War, Stephen Watts Kearny's expeditions in the Southwest served to enlarge U.S. territorial holdings by more than a million square miles. Born in Newark, New Jersey, Kearny enrolled at Columbia College. On the outbreak of the WAR OF 1812, he served as an officer in the Thirteenth Infantry Regiment. A brave troop leader, he was wounded and captured by British forces. At the close of the war, he remained in the army, transferring to the Second Infantry Regiment. In 1819, he was transferred to the West, where he joined an expedition exploring a part of the Louisiana Purchase acquired by the United States in 1803. Meriwether Lewis and William Clark had first crossed this vast landscape between 1804 and 1806. Further exploration had been delayed by worsening relations with Great Britain and with the Indian nations of the region. After signing the TREATY OF GHENT in 1814, ending the War of 1812, the government renewed its interest in the huge domain west of the Mississippi River. Kearny was among the first army officers to make a professional career in the West.

As a means of exerting control over the many Indian peoples of the region, Kearny commanded a regiment of mounted dragoons that established the nation's military presence on the Great Plains. He was an excellent unit commander, a strict disciplinarian, and a fine representative of the strength of the American government. He made the dragoons into an elite unit, renowned for their discipline, mobility, and ability to intimidate. As a result, over the next 20 years, Kearny rose steadily in rank.

With the outbreak of the MEXICAN-AMERICAN WAR in 1846, the War Department ordered Kearny to organize an army to conduct a campaign across the West into New Mexico and California, two of the main objectives of American military operations. With 1,600 men in his command, Kearny and his "Army of the West" left FORT LEAVENWORTH for the Southwest. In August 1846, they entered Santa Fe, where the officials in New Mexico surrendered without a fight. Kearny declared New Mexico a part of the United States and appointed CHARLES BENT as governor.

It was in Santa Fe that Kearny received news of his promotion to brigadier general. He soon left New Mexico and headed west to CALIFORNIA by way of the Gila River. With

Stephen Watts Kearny (Library of Congress)

a much-reduced army numbering no more than 120 men, he defeated a Mexican force at San Pasqual, California, and early in 1847 he and his army reached San Diego. There he joined Commodore ROBERT FIELD STOCKTON in a brisk and bloody campaign to subdue Mexican forces along the coast of Southern California. The combined force won a series of engagements and captured Los Angeles in January 1847.

Before Commodore Stockton retired, he appointed Captain JOHN C. FRÉMONT as governor of the conquered province of California. Kearny was outraged and challenged the appointment, arguing that Stockton had no authority to appoint the governor. On March 1, 1847, Kearny organized his own government with himself as governor, but Frémont refused to recognize this authority. Kearny charged Frémont with insubordination (failure to obey the orders of a superior officer) and mutiny. A court-martial found Frémont guilty, and he resigned from the army.

In summer 1848, Kearny was military governor at Vera Cruz and Mexico City. Promoted to the rank of major general, he returned to St. Louis to command the Sixth Military Department. In autumn that year, he died from yellow fever.

**Keokuk** (ca. 1790–1848) *ally of Americans, rival of Black Hawk*

Keokuk (Watchful Fox) was a Sac and Fox chief who facilitated U.S. military and expansion interests. He was born in Saukenuk (Rock Island, Illinois) to a Sauk warrior and a French mother. His mixed-blood status would normally have precluded any access to tribal leadership positions, but Keokuk proved himself ambitious and eloquent. By the WAR OF 1812 he had risen to become a war chief of significance. In this capacity he established himself as a rival to the ardently pro-British Black Hawk, and thereafter Keokuk became closely identified with American interests.

After the War of 1812 Keokuk went to great lengths to accommodate U.S. demands and effectively persuaded his followers to do likewise. Such compliance only increased the belligerence of Black Hawk and his faction, which sought to retain traditional tribal hunting lands in Illinois. The issue came to a head in 1832, when Keokuk sold his tribe's remaining lands to the United States and led his followers across the Mississippi River to Iowa. Meanwhile, Black Hawk returned to wage the disastrous BLACK HAWK WAR of that year. The outcome—an American victory—basically eliminated Native American resistance east of the Mississippi, and the victors gave Keokuk authority over the now disgraced Black Hawk.

Keokuk, chief of the Sac and Fox (Library of Congress)

After the Black Hawk War, the Sac and Fox formally relocated to new lands in Iowa. Here Keokuk increased his tribal power by diverting government annuities into the hands of other chiefs and supporters, raising accusations of cronyism from his own people. But he strongly resisted government attempts to allow missionaries on his lands. He also secured the right for them to war against neighboring Sioux, a traditional enemy. In 1836, 1837, and 1842, the chief was involved in further negotiations with the American government, and he concluded treaties that forced the Sac and Fox to abandon Iowa for new homes in Kansas. Keokuk, always cognizant that armed resistance would be disastrous for the tribe, acquiesced and moved as requested; his acquiescence, however, only deepened divisions in tribal relations. The chief died of dysentery after an alcoholic binge in 1848. Nevertheless, the grateful government constructed a bronze statue of him in the Capitol Building in Washington, D.C. He was succeeded by his son, Moses Keokuk, a Baptist preacher.

**Key, Francis Scott** (1779–1843) *lawyer, author, poet*  
Best known as the author of “The Star Spangled Banner,” Francis Scott Key was a lawyer from Maryland. His moment of fame came near the end of the WAR OF 1812, when he was a spectator aboard a British ship during the attack on Fort McHenry in the BATTLE OF BALTIMORE (September 12–14, 1814). Key had traveled through the British lines to arrange the release of Dr. William Beanes, who had been taken captive in the British campaign against Washington, D.C. Although the British agreed to release Beanes, they detained the Americans during the night of September 12–13, as they launched a massive bombardment on Fort McHenry. After watching the attack from aboard a British warship, and seeing the American flag still flying in the morning, Key was inspired to write a poem—“The Star Spangled Banner.” Although it is not known with certainty when he wrote the words, family and friends claim that he did so while in a British longboat taking him ashore on September 13. Nevertheless, he soon shared the lines with others, and within days of the great victory at Baltimore, the poem was published as a handbill. Soon it was being sung to the tune of the British drinking song, “To Anacreon in Heaven,” in taverns throughout the nation.

Key wrote some other poetry, but little of real note. He focused most of his energies on his law career and served as the U.S. district attorney in Washington, D.C., from 1833 to 1841. Written at a time of rising American nationalism, his best-known work remained popular. In 1931, Congress adopted “The Star-Spangled Banner” as the U.S. national anthem.

### Know-Nothing Party

The Know-Nothings were members of a nativist political movement in the United States in the 1840s and 1850s that was organized to oppose the great wave of immigrants who entered the United States after 1846. Know-Nothings began as a secret fraternity called the “Order of the Star Spangled Banner” who enlisted over a million members across the country in 1854 and 1855. When asked any questions about it they replied “I know nothing.” Thus, they were swiftly labeled the “Know-Nothings.”

IMMIGRATION grew sharply in the 1830s and 1840s and became increasingly Roman Catholic with the arrival of large waves of Irish and Germans. Simultaneously, a Protestant revival flourished in a climate of economic change and insecurity. Evangelists demonized Catholics as “Papists” who followed authoritarian leaders, imported crime and disease, stole jobs, and practiced moral depravities. A barrage of such agitation led Protestant workingmen to burn

the Ursuline Convent near Boston and to riot in several cities; 30 were killed and hundreds injured in Philadelphia in 1844. The Know-Nothings grew out of this increasingly nativist atmosphere. Their anti-immigrant doctrines became even more popular when Irish and German Catholic immigration swelled to unprecedented numbers after 1845.

The new immigrants appeared to assimilate too slowly, clinging tenaciously to their old ways. The Germans retained their language, and the Irish adhered closely to the Catholic Church. Both, moreover, depressed the labor market while the Irish, especially, showed considerable political zeal—and usually voted the Democratic ticket.

The Know-Nothings attracted working-class and middle-class voters angered by the job competition from immigrants, the increase in crime, public drunkenness, and pauperism that accompanied immigration; the supposed pollution of the body politic by ignorant immigrant voters; and an assertiveness by Catholic clergymen that supposedly threatened the nation’s Protestant values and institutions. Such nativist sentiments had long existed among many Americans, but they had never before been expressed in such powerful form.

Among the chief legislative aims of the Know-Nothings were an extension in the period required for naturalization from five to 21 years, the exclusion of the foreign-born and Catholics from public office, the limitation (or prohibition) of alcohol sales, and the restriction of public-school teaching to Protestants.

As early as the 1840s, there were local nativist parties in several northern states that drew support away from the DEMOCRATIC PARTY and WHIG PARTY. The movement was temporarily eclipsed by the MEXICAN-AMERICAN WAR and the debates over SLAVERY. However, when the slavery issue was temporarily quieted by the COMPROMISE OF 1850, the nativist movement again came to the fore. By the early 1850s, there was a trend to organize nationally against the presumed immigrant threat. The old parties, the nativists said, had not confronted the danger. The Democrats, it was charged, were supported by the aliens; the party needed their votes and catered to their whims.

Growing rapidly, the Know-Nothings allied themselves with the group of Whigs who followed MILLARD FILLMORE. In the 1854 election, they almost captured New York State, swept the polls in Massachusetts and Delaware, and had local successes in other states. The disintegration of the Whig Party aided them in their strides toward national influence. Looking toward extension into the South, in 1855 they openly assumed the name American Party and cast aside much of their characteristic secrecy. By the mid-1850s the nativist American Party (a.k.a. “Know-Nothings”) had won six governorships and controlled legislatures in Massachusetts, New Hampshire, Connecticut, Rhode Island,

A pronativist cartoon that depicts an Irish and a German immigrant stealing a ballot box (Library of Congress)

Pennsylvania, Delaware, Maryland, Kentucky, and California. They enacted numerous laws to harass and penalize immigrants (as well as newly annexed Mexicans), including the first literacy tests for voting, which were designed to disenfranchise the Irish in particular.

By 1855, 90 U.S. congressmen were linked to the party. They attracted many northern Whigs to their point of view, along with an important number of Democrats. Southern Whigs also joined because of growing sectional tensions caused by the reintroduction of the slavery issue into national politics in 1854. For a time it seemed as if the Know-Nothings would be the main opposition party in the United States.

By 1856, when the party had abandoned secrecy and campaigned publicly as the American Party, many people expected it to elect the next president. But at the national convention in February 1856, which nominated ex-Whig Millard Fillmore for president, Know-Nothings split along sectional lines over the slavery extension issue. The Know-Nothings of the South supported slavery, while northern members opposed it. At the 1856 convention, 42

northern delegates walked out when a motion to support the MISSOURI COMPROMISE was ignored. This time the slavery issue split the Know-Nothing movement as it had the Whigs. While the American Party presidential candidate, Fillmore, won more than 21 percent of the popular vote and eight electoral votes, the national strength of the Know-Nothing movement was broken.

That same year, the great majority of northern Know-Nothings joined the Republicans in supporting JOHN C. FRÉMONT for president, and between 1856 and 1860 almost all the rest of Fillmore's northern supporters became Republicans. Those converts helped Lincoln garner 500,000 more votes in 1860 than Frémont had won in 1856.

Know-Nothing parties remained strong in a number of northern states in the late 1850s, but the party was spent as a national force before the election of 1860.

### labor movements

Given the divergent regional economies in the antebellum North and South, laborers' efforts to get fair treatment for their work varied widely. In the North, wage-earning workers fought and sometimes struck for direct improvements to work conditions and in the ability to organize as an affiliated group, such as a union. Although these efforts were often bloody, they marked what would become a standard employee-owner/employer state of coexistence. In the slave-labor South, slaves lacked the standing as employed workers to present such demands. Nonetheless, slaves entered into varieties of negotiations and work slowdowns with planters, overseers, and other members of the staple-crop (cotton, rice, sugar) hierarchy to acquire and maintain a modicum of independence.

A factor militating against union formation was the geographic mobility of American workers. Throughout the antebellum period, laborers were seldom stationary for more than a decade, and they were readily replaced by other transients or by newly arrived Irish and German immigrants. When workers, regardless of gender or skill level, acquired the wherewithal to move, most simply did so. The ongoing transportation revolution promoted this trend; it is doubtful that any other nation possessed so mobile a working class as the United States in this period. Such lack of personnel continuity discouraged any sustained unionism in the trades.

#### *The North*

After the American Revolution, many people searched for ways to create a more just and perfect society. At the same time, an increasingly industrialized workplace was bringing various constraints to workers. The interaction of high-minded reform and the practical fight for humane work conditions helped to fuel early labor movements during the first half of the 19th century. Since the late 18th century, skilled urban workers had joined in local groups to protest wage cuts, but trade unions did not begin in earnest

until the 1820s, with the formation of unions such as the Mechanics' Union of Trade Associations in Philadelphia in 1827. Over the next decades, several skilled trade unions formed, with some, such as the International Typographical Union (1852), representing several countries.

As industrial capitalism increased over the period, workers experienced growing financial and social distance between themselves and owners. In addition to work-related demands, this perceived inequality fostered another reason for labor reform: changes that would build a more socially equal society. Thus, in addition to fighting for higher wages, the labor movement also enacted reforms such as labor-related political parties and campaigns for equal rights. These two strands of the labor movement—one for improving job-related concerns, one for improving society—would dominate northern labor reform during the antebellum years. But generally, most trade unions were galvanized into action through pursuit of a 10-hour workday; this became a rallying point for the New England Association, which represented factory hands, mill workers, and skilled craftsmen. The association unsuccessfully struck for a 10-hour day in Boston in 1832 and 1835, but its efforts induced a successful movement for workers in Philadelphia.

For much of the antebellum period, journeyman workers (those less experienced and below master workers) linked their case for better working conditions to the ongoing universal aim of a just society, the ideal that Americans fought for during the American Revolution. For example, when the ECONOMY revived after the PANIC OF 1819, many unions called for improved conditions, such as the ongoing call for the 10-hour workday. Among them were New York workers in 1827, who contended that employers who sought to extend the workday to 11 hours were "aggressors upon the rights of their fellow citizens . . . [and] justly obnoxious to the indignation of every honest man." At mass demonstrations in eastern cities such as Philadelphia and New York, workers of various craft unions united in their

goals for what the Philadelphia Mechanics' Union of Trade Associations called the need to fight "the desolating evils which must invariably arise from a depreciation of the intrinsic value of human labour . . ."

Workers also took direct action in the form of strikes to demonstrate displeasure with owner actions. Continuing a practice that began with artisans during the late 18th century, workers often staged a turnout, in which a group of workers remained unemployed until wages reached a given level. Generally, strikes in the early 19th centuries occurred in cities and involved skilled members of trade groups, such as shoemakers and tailors. Concerns involved improving the pay scale or reducing the length of the workday. As strikes increased during the 1820s and 1830s, small labor groups that discovered shared goals united to form larger and potentially more powerful associations. Although violence occurred during these strike protests, no strike-related deaths occurred until 1850, when two tailors were killed as police attempted to break up a striking crowd.

To increase the chances for labor reform, laborers and reformers during this time sought political representation and power by forming political parties. In the late 1820s, the Philadelphia Mechanics' Union, a pioneering multicraft union, formed the Workingmen's Party of Philadelphia. Other Workingmen's Parties arose in eastern cities, including Boston and New York, and at least one representative was elected to a position in local government. Some party leaders' positions undercut support among more moderate party members. New Yorker Thomas Skidmore, for instance, called for equal rights, an end to inherited land, and the redistribution of wealth. But some ideas, such as reducing special privilege among the financial elite, controlling monopolies, opening public lands for homesteading, and creating a large-scale public school system, gained widespread popularity between the 1820s and the 1840s. Further, many of the Workingmen's Party's ideas came to be expressed by more powerful political parties, notably Democrats and Whigs. As a result, most Workingmen's Parties dissolved during the 1830s.

However, the unity among trade unions that developed during the 1820s continued and resulted in several dozen new multitrade unions during the next two decades, such as the General Trades Union and the National Trades Union. These unions embodied an increasing understanding of the need for all workers to pool their efforts to counter increasingly sophisticated campaigns of commercial interests. Such efforts were epitomized in an opinion in the *Journal of Commerce*, which equated strikes with "war with the order of things which the Creator has established for the general good." Debate over which public policy was true to democratic ideals—building a society upon accepted views of equality and justice or allowing society to emerge amidst

economic freedom—continued throughout the antebellum period (and beyond).

Shortly after strikes became regular practices after the close of the 18th century, employers sought defense through the courts. Successful prosecutions of striking workers were mounted before the 1820s on criminal conspiracy charges. By 1829 in New York, a law was passed to censure any collective action that is "injurious to public morals or to trade and commerce."

Despite such rulings, strikes for improved hours and pay continued through the 1830s, as did employer and other forms of community-based attacks. In 1836, New York journeymen tailors began a strike over violations of negotiated agreements on pay rates and hiring union labor. After an outdoor protest, a grand jury indicted several of the protesters, 20 of whom were convicted on conspiracy charges. A massive demonstration that included over 10 percent of all New York residents protested the decision.

Although popular support for the labor demands of male workers was increasing, women often gained little favor for their labor protests. Since the 1810s, females dominated the textile mills in Massachusetts and formed associations in the 1820s. Many male laborers disparaged female workers and considered the presence of women in the workforce a twofold attack. The female worker attacked domestic society, in which women were to restrict their sphere of influence to the home; and the workforce in general, where their menial jobs lowered the overall standard of a trade. Still, female workers continued to form other trade associations, such as the Tailoresses' Society, and protested wage cuts. At the Lowell, Massachusetts, textile mills in 1834 and 1836, women staged two widespread strikes over increases in room and board charges and reductions in pay, one involving over 15 percent of mill workers. At one point, more than 1,000 girls marched through Lowell streets, singing, "Oh, isn't it a pity, such a pretty girl as I / Should be sent to the factory to pine away and die?"

This first wave of unionizing began to lose ground in 1836, when employers made concerted efforts to break strikes and collapse unions. The unions themselves were politically divided over their exact jurisdiction and how to effectively respond to the challenge posed by management. Then they suffered a tremendous blow when the PANIC OF 1837 swept the land. The ensuing depression, which was economically profound and lasted seven long years, basically erased all union gains to that point.

As mid-century approached, however, unions began to gain more rights under U.S. law. In 1842, the appeal ruling of Chief Justice Lemuel Shaw in *Commonwealth v. Hunt* granted unions the right to organize. The case involved an 1840 conviction of seven labor leaders for criminal conspiracy in calling a strike by the Boston Journeymen Boot-

makers' Society against the hiring of nonunion employees. Justice Shaw's ruling allowed the right of a union to make its presence and requests known by a strike. Nonetheless, strikes did not resume in earnest until the early 1850s, when hundreds of strikes were launched.

Well into the 1830s, trade unions represented only skilled workers such as tailors and printers. But the issue of unskilled labor and unionization came into discussion as tens of thousands of European, primarily Irish, immigrants entered the United States during the 1820s and 1830s to toil as unskilled laborers. Working at ship construction, railroad building, and as dock workers, these workers often formed secret groups to stage protests and targeted acts of violence. In 1835, skilled and unskilled workers united for a general strike in Philadelphia. This joint experience led the large General Trades Union to open membership to unskilled workers and pointed to the workers' understanding that all workers share common goals. As striking tradesmen on the street yelled, "We are all day laborers!"

Throughout the antebellum decades, economic conditions directly affected union growth. Particularly destructive were economic declines. The depression of 1819 caused businesses to close, dismiss workers, or drastically reduce wages. In turn, workers viewed unions as tangential to creating work, and many of them ended their existence. Businesses welcomed the erosion of unions; the *Journal of Commerce* called it a welcome step toward eliminating morally diseased unions "thoroughly." The PANIC OF 1837 and a depression that lasted from 1839 to 1843 generated prolonged unemployment that similarly diminished union power.

By the early 1850s unions and union membership had increased, with ethnic groups such as the Irish and Germans now actively mobilizing and joining forces. While craft hierarchy and ethnic tensions continued, labor leaders sought to unite workers. As one leader said of business in 1855, "They wish to separate the American mechanics from the German, and the German from the Irish; they want to keep you in a divided condition so that you cannot concentrate your action for the benefit of yourselves and fellow workingmen." This solidarity aided workers in the panic of 1854–55 and for decades to come, as voiced by a German worker: "We all belong to one great family—the Workingmen's family!"

### ***The South***

Although large-scale plantation owners viewed themselves, in the words of one planter, as "kind masters" and the slaves' lot as protected, the millions of slaves who worked the farms viewed their lives differently: as paths of modification and resistance. The negotiations that slaves devised in working under their owners and overseers mark the pri-

mary form of labor action in the South during the antebellum period and the slaves' main method for achieving some scraps of independence.

Slaves on large plantations, which held between 20 and 100 of them, had the greatest chance for family stability; their work was needed, and for that reason families might be kept together. How they would be treated by their masters was less predictable. All masters wanted productivity from their slaves, but some used physical punishment to achieve it, while others employed various types of personal inducements. Among them might be the right to hunt, fish, and plant one's own garden and market its crops. Such activities allowed slaves to have some portion of life that belonged to them, not to the plantation.

In coastal cities, transient day laborers (who were often white but without land) working the plantations and farms displayed different methods for gaining acceptable treatment. They argued with workers and owners, were unruly and unpredictable, and maintained a sense of social superiority. Through these actions, they demonstrated that they were above slaves and had no connection to the plantation (where slaves worked).

Acts of slave resistance were common, as they consisted of any action not requested by an owner. Typical behaviors included spilling food and drink on a member of the owner's family, breaking equipment, or working inefficiently. Slaves viewed such rebelliousness with equanimity. As one young slave said, "They always tell us it's wrong to lie and steal, but why did the white folks steal my mammy and her mammy?" Other slave practices of self-preservation included the establishment of secret trading groups that exchanged liquor for stolen plantation goods. In addition to providing goods, this secret trading allowed slaves and white traders to discuss matters from family concerns to escape. Any of these interactions was considered an act of disobedience and subject to punishment.

Rarer and more feared by owners were overt acts of physical aggression or sabotage. Among such acts were the 1822 insurrection led by a free slave named DENMARK VESEY and the 1831 insurrection of NAT TURNER. Concerned about curtailing such unrest, political leaders passed laws limiting slave education. In Virginia and North Carolina, slaves were prohibited from learning to read. The just society that reformers and workers were fighting for in the North was far more distant in the South.

In sum, labor movements of the antebellum period were fractious and episodic, but also demonstrated a nascent class conscientiousness across a spectrum of workers, all of whom determined to secure a more equitable share of profits produced by their labor. Still, organized labor as a whole would not revive until after the Civil War, when many veterans of that conflict went on to found the Knights of Labor in the 1870s.

### Lafitte, Jean (ca. 1780–ca. 1825) *pirate*

A notorious pirate and hero of the BATTLE OF NEW ORLEANS (January 8, 1815), Jean Lafitte lived an adventurous life packed with intrigue. Believed to have been born in France, Lafitte eventually made his way to the United States, where he led a group of pirates headquartered on the Baratarian coast, south of New Orleans. Starting around 1810, he and his cohorts frequently targeted Spanish ships, and, with the help of Lafitte's brother Pierre, used New Orleans as a depository for the confiscated goods and slaves that came into their possession.

The WAR OF 1812 (1812–15) interrupted the smuggling and piracy enterprise of Lafitte's operation. In September 1814 he was approached by the British and offered a large sum of money as well as land and a commission in the Royal Navy if he and his men would join with British forces in an assault on New Orleans. Lafitte turned down the offer, and a few days later his ships and headquarters at Barataria were raided by the U.S. Navy. In exchange for a pardon, Lafitte told the Americans about the British offer and agreed to help the United States stop the impending British attack. Indeed, Lafitte and a number of his men served admirably in the Battle of New Orleans, dutifully manning artillery pieces and earning the praise of General ANDREW JACKSON for bravely contributing to the American victory. After the war, Lafitte received a pardon from President James Madison for attacks on U.S. citizens and property as a reward for his service.

Lafitte took advantage of this new lease on life and almost immediately returned to piracy. With the United States in firm control of Louisiana and the eastern approaches to the Gulf of Mexico, Lafitte and his men moved westward. In 1817 they settled near present-day Galveston, on the southern coast of the province of Tejas, in Spanish territory. From there they engaged in numerous smuggling and piracy operations, and Lafitte's empire expanded. He went from having only a few hundred men to just over a thousand, and for the next three years he successfully attacked American and Spanish ships in the Gulf of Mexico and the Caribbean without any trouble. In 1820, however, the U.S. Navy went in search of Lafitte after some of his men seized American property. Under pressure and fearing capture, he and a band of followers left Galveston in 1821 and probably continued their activities from the coast of newly independent Mexico. The cause of his death is unknown, but he is believed to have died around 1825.

### Lake Erie, Battle of (September 10, 1813)

The Battle of Lake Erie was a pivotal contest during the WAR OF 1812 (1812–15). It gave American forces control of Lake Erie and compelled the British to retreat from western Canada.

In the early months of the war, the British controlled both Lake Ontario and Lake Erie, enabling them to capture Fort Detroit and supply their troops and Indian allies farther west. The Americans, realizing the need to take control of Lake Erie, assigned the task to Lieutenant Oliver Hazard Perry. Perry was only 27 years old, but he had been in the U.S. Navy since the age of 13. He was the ideal man for the job, with great confidence, excellent administrative skills, and experience in shipbuilding. As commodore, Perry immediately had his men begin constructing ships on the beach near present-day Erie, Pennsylvania. Within a few months, they had produced two brigs and four schooners.

The British commander on Lake Erie was Lieutenant Robert Barclay, who, like Perry, was young, energetic, and ambitious. Although he temporarily held the upper hand, he had a smaller fleet and fewer men and resources. Barclay was unable to convince his superiors to divert men and supplies to Lake Erie from the Lake Ontario region. Eventually he was forced to improvise in equipping his ships. He even stripped local forts of their guns for his squadron. As a result, Barclay's flagship alone had guns of six different calibers, many of dubious effectiveness.

After considerable jockeying for position on the lake and attempting to blockade each other, the two sides met on September 10, 1813. The more heavily armed American force had 10 vessels to the British six. Nevertheless, the battle was a closely fought affair, with each side inflicting severe damage on the other. Perry's flagship the *Lawrence* was disabled, and he was forced to transfer to the *Niagara*. He then daringly sailed straight at the British line and in a matter of minutes was able capture the British flagship and force their squadron to surrender. There were many killed and wounded on both sides, including the seriously wounded Barclay. After the battle, Perry sent the message "We have met the enemy and they are ours" to General HARRISON.

As a result of his victory Commodore Perry became a national hero, and Congress voted extra pay and generous prize money for him and his crew. The victory gave the Americans a substantial psychological boost and control of Lake Erie. The British general Henry Procter was forced to retreat, and the British relinquished control of Lake Erie to the Americans. This helped to eliminate the danger of British attacks on American forces in the West. Less than a month later, American troops crossed the lake into Canada and won an important victory at the **BATTLE OF THE THAMES** (October 5, 1813), forcing the British to relinquish their control of the area and cancel their invasion plans. The navy promoted Perry to captain, and he went on to commands in the Mediterranean and the South Atlantic. He never again engaged in combat and died of yellow fever in 1819. Following the War of 1812, there was no more naval warfare on the Great Lakes, and the Canadian-American border was eventually demilitarized.

### Lamar, Mirabeau B. (1798–1859) politician

Mirabeau Lamar was the second president of the Republic of Texas. Lamar was born in Louisville, Georgia, on August 16, 1798, and raised in Milledgeville, Georgia. He was educated at several academies and expressed an early interest in poetry and art, but he ultimately pursued a career in politics. In 1823 Lamar became the secretary of Governor George M. Troup. By 1828 he was editor of the *Columbus Enquirer*, which endorsed Troup's policies. The next year, however, he withdrew from a state senate race following his wife's death. A strong proponent of states' rights and SLAVERY, Lamar lost two elections for a seat in Congress in 1832 and 1834.

In 1835 he accompanied James W. Fanin to Texas. That region was then in the throes of a revolution against Mexico, and Lamar cast his lot with the rebels. Good conduct in battle won him command of a regiment of cavalry, and Lamar distinguished himself at San Jacinto in 1836. That September he parlayed his newfound fame into politics and was elected the first vice president, under President SAM HOUSTON, of the new Republic of Texas. Nonetheless he spent the majority of his time traveling, studying Spanish, writing poetry, and establishing the Philosophical Society of Texas.

In 1838 Lamar cleverly arranged the defeat of Houston's handpicked successor and was himself elected president of Texas. In this capacity, Lamar proceeded to spend the

fledgling country into bankruptcy by promoting an extensive public education system, launching several preemptive wars against the Cherokee and Comanche in Texas, and supporting several ill-timed and unfortunate filibustering expeditions against Mexico. ("Filibusters" were American citizens who sought to gain territory by waging private wars in Central America and the Caribbean.) He also relocated the capital from Houston to its present-day location of Austin, much closer to the republic's center. His expensive education system provided for the creation of two universities, including the modern University of Texas, which adopted his slogan, "A cultivated mind is the guardian genius of democracy."

After Lamar was succeeded in office by Houston in 1841, he returned to private life in Richmond, Texas. He spent several years writing history and poetry. During the MEXICAN-AMERICAN WAR of 1846–48, he served as lieutenant colonel of the Texas Volunteers under General ZACHARY TAYLOR. In 1857 he gained appointment as the U.S. minister to Costa Rica. Poor health necessitated his return to Texas, where he died at his Richmond plantation on December 19, 1859.

**Lamy, Jean Baptiste (Jean-Baptiste Lamy)** (1814–1888) *Roman Catholic missionary*

Roman Catholic missionary and later archbishop in the American Southwest, Jean Baptiste Lamy was responsible for the establishment of the first school for teaching English in Santa Fe. Lamy was born in 1814 in Lempdes, France, and ordained a priest at Clermont-Ferrand in December 1838. After volunteering for missionary work, he came to the United States to minister to the growing Catholic community in Cincinnati, Ohio.

Under the terms of the TREATY OF GUADALUPE HIDALGO, which ended the MEXICAN-AMERICAN WAR, the United States took the northern third of the Republic of Mexico, a vast area that today includes the states of CALIFORNIA, New Mexico, and Arizona. In response to the new U.S. sovereignty, Lamy was named vicar apostolic of New Mexico. His authority extended over New Mexico, Arizona, and parts of modern Colorado, Nevada, and Utah, a vast area with a then-sparse population mostly Mexican in origin, living in small and widely dispersed villages.

From the beginning, Lamy's new office was a challenging one. He arrived in Santa Fe to find great resentment at the appointment of an outsider to a position of such author-

ity. In 1853 he was named bishop. He worked with Anglo-Americans, Mexicans (Mexican Americans after the treaty), and NATIVE AMERICANS across a vast landscape. In New Mexico he encountered a church that had become self-contained and partly secularized by distance, neglect, and personal choice. Some local priests had married into the most influential families in New Mexico, and Lamy's attempts at reform became closely intertwined with politics. One of the defrocked priests, Jose Manuel Gallegos, became head of an anti-Lamy faction and won election as New Mexico's territorial delegate in 1853. Father Jose Antonio Martinez represented this local authority, and after continuing disagreements, Lamy removed Martinez.

In 1875 Lamy was raised to archbishop. He was again drawn into politics by a bill in the Territorial Assembly that proposed to limit the Catholic Church's influence in the territory's educational system. Lamy actively opposed the bill, and it was defeated. He died at Santa Fe in 1888 after more than 35 years of service to his adopted region. His reforms reshaped the Catholic Church in the American Southwest.

**Further reading:** Paul Horgan, *Lamy of Santa Fe; His Life and Times* (New York: Farrar, Straus & Giroux, 1975).

**Larkin, Thomas Oliver** (1802–1858) *businessman, diplomat*

Merchant and U.S. consul in Mexican California, Larkin mounted an extended propaganda campaign in favor of the American acquisition of CALIFORNIA. A native of Massachusetts, Larkin moved to California in 1832. Settling in Monterey, he quickly became a powerful commercial force in the town. He used his connections with Boston and the New England merchants to direct the growing trade of California's pastoral economy. With the secularization of the CALIFORNIA MISSIONS after 1833, the region's economy shifted from the missions to the growing number of ranchos. These large pastoral estates, many of them benefiting from the acquisition of mission lands, began to develop a thriving trade in hides and tallow, carried almost exclusively in ships from New England ports. Larkin was at the heart of this growing trade.

Many American merchants who settled in California in the 1830s and 1840s married into the leading Californio families and established roots in the local Mexican community. Larkin, by contrast, remained a citizen of the United States. He married Rachel Hobson Holmes, a widow, and he was proud that his children were the first born in California to U.S. citizens. As an alien resident, he did not participate in politics, but he did discreetly support the activities of Juan Bautista Alvarado to establish an independent California.

In 1844 Secretary of State James Buchanan appointed Larkin American consul in California. In this capacity, Larkin wrote long and detailed letters to the secretary about affairs in Mexican California, ever mindful of the nation's economic and strategic interests there. He came to believe strongly in British designs on naval anchorages along the Pacific coast, especially the harbor at San Francisco. In October 1845 Buchanan gave him an additional appointment as "confidential agent." Buchanan asked Larkin to work for the secession of California from Mexico, with a view to its eventual annexation to the United States. In January 1845, Congress had annexed the Republic of Texas as the 31st state, and this provided a model of the direction in which Buchanan wished to move American policy regarding California. Larkin was to play a vital role in the U.S. plans.

However, these plans were cut short by JOHN C. FRÉMONT's activities, and with the outbreak of the BEAR FLAG REVOLT, Larkin found his diplomatic initiatives superseded. The beginning of the MEXICAN-AMERICAN WAR the next year was President JAMES K. POLK's shortcut to the acquisition of California.

With the discovery of gold in California in January 1848, Larkin became one of the American government's main sources of information about developments in the region. His correspondence with Buchanan offers one of the clearest and most insightful commentaries on the early impact of gold on California's society and economy. In late 1848, Larkin served as a delegate to the California Constitutional Convention. Thereafter, he left public life to concentrate on his business and real estate holdings. He died in 1858.

## lead mines

Lead mining first achieved significance in the English-speaking colonies in 1750, when quantities of that ore were extracted and smelted in Dutchess County, New York, and at what became known as the Austinville mine in Virginia. The industry grew exponentially during the Revolutionary War, when demand for lead bullets led to the mining of deposits in Massachusetts, Connecticut, Maryland, Pennsylvania, and North Carolina. The relative abundance of lead and the ease of smelting this useful metal allowed a homegrown armaments industry to flourish and greatly facilitated the ultimate victory over Great Britain.

Out west, the first important lead mines were found in upper Louisiana, in what would become the state of Missouri. Located in St. Francis County, some 70 miles south of St. Louis, these deposits produced some 9 million tons of pig lead, most produced after 1800. The first

Europeans to work the surface ores included the sieur de Bienville, one of the founders of French Louisiana. In 1719, Philippe Renaut began systematic mining in the Illinois Country with 200 experienced French miners and 500 slaves purchased in St. Domingue and brought to the site. Mine La Motte and Mine à Breton produced the first lead for trade. The mines and the trade they fostered were an important part of the French settlements by the 1740s. Still, the Missouri mines remained only marginally productive, as the attention of colonial entrepreneurs shifted to trade in furs. In the years of Spanish rule, MOSES AUSTIN moved from Virginia to Missouri and took an active part in the lead-mining business. Austin established a large furnace and a shot tower along the Mississippi River as early as 1798, and within a few years his company was producing 3 million pounds of lead annually. These facilities were added to the national resources in 1803 after the Louisiana Purchase gave the United States control of the region. With the profits from his mines, Austin moved his family (including son STEPHEN F. AUSTIN) to St. Louis in 1816.

The second area of lead mineral lay in the upper Mississippi Valley, at the intersection of what would become the states of Illinois, Wisconsin, and Iowa. The area was much larger but less rich than the deposits in Missouri. The earliest leading figure in the region was Julien Dubuque, a French-Canadian entrepreneur who began mining on the Upper Mississippi in 1788, near the site of the present city of Dubuque. Indian peoples knew of these mineral deposits and had mined them sporadically. Dubuque urged the Sauk and Fox to resume work, and he bought lead ore from the Indian miners and shipped it south to St. Louis. By the time of his death in 1810, Dubuque had also begun mining on the Fever River (later renamed the Galena River) and other sites along the Mississippi. The NATIVE AMERICANS continued to mine and smelt lead until the late 1820s, when an influx of American settlers and their African-American slaves led to their gradual displacement. The Sauk and Fox were subsequently relocated across the Mississippi River in the wake of the aborted BLACK HAWK WAR of 1832, at which point lead-mining activities became an exclusive purview of Americans.

In 1819, after the close of the WAR OF 1812 had established a degree of peace with NATIVE AMERICANS, American miners moved into the region. By the middle of the 1820s, an early mining rush—much like those later to mining sites in the Far West—was underway to the area. Important towns appeared to mark the sites of these mining enterprises: Galena (Illinois), Mineral Point (Wisconsin), and Dubuque (Iowa). Of these towns, Galena was the most important, perhaps because Illinois was early organized as a territory and so offered a degree of institutional structure. Miners here, as later in the Far West, made do

with their own rules and regulations. They organized mining districts and adopted local rules for claims and adjudicating disputes, thus laying the foundation for many techniques in mining and organization that would later be used in the CALIFORNIA GOLD RUSH. The so-called Scotch hearth, invented in 1834 by Peter Lorimer, simultaneously increased productivity and lowered production costs. With this technology the lead-mining industry was able to spread farther into the Midwest, and there was a commensurate rise of communities dedicated to that process. By 1845 Dubuque and Galena boasted a combined population of 10,000 people and an annual output of 54 million pounds of lead. The final product was either shipped down the Mississippi to New Orleans or transported overland by wagon to the ERIE CANAL and then shipped to ready markets along the East Coast. The growth and profitability of lead mining had an indelible impact on the Upper Midwest: It was probably the leading factor propelling the region's relatively rapid early settlement. After 1848 this trend was accelerated when Congress decided to abolish the reservation of mineral lands; these lands became available to any prospective miner or entrepreneur wishing to mine lead. Lead mining expanded across the three sites through the 1830s, but by 1840 the richest of the deposits had been mined out. With the news of the gold strikes in California, an emigration of lead miners to the West depleted the lead region.

The experiences of lead mining in Missouri and on the upper Mississippi River were important in preparing a foundation for large-scale mining activities in California and eventually across the length and breadth of the West. Underground mining in the lead mines evolved slowly and through trial and error, but it did evolve. Furthermore, many of regulations and procedures that emerged from the lead mines would be transported across the plains with the FORTY-NINERS and reappear in the goldfields. These included the mining claim—namely, how claims would be laid off, recorded, and worked and under what conditions claims might be vacated and sold. The institution of the miner's court first appeared in the lead mines, along with the idea of the mining district as a sovereign body empowered to make and change its rules of conduct.

The lead mines also represented a significant challenge to the orderly distribution of public lands. Since 1785, the nation had evolved a procedure for the survey and sale of acreage to the public. PUBLIC LAND POLICY had consumed much time in Congress, and the continuing advance of settlement to the West had made land sales a necessary part of the frontier's development. In the lead mines of the upper Mississippi, the federal government confronted an awkward variation in its policies. In response to the spread of population and the land system to the upper Mississippi Country, the federal government issued a proclamation

reserving lead lands from sale. The policy proved unworkable, and like so many infringements on the public domain, was ignored and reversed.

**Lee, Jason** (1803–1845) *settler, missionary*

Jason Lee was a Methodist missionary and a leader of the settlers' movement in Oregon Territory. Born in Stanstead, Vermont, on June 28, 1803, Lee eventually relocated to Wilbraham, Massachusetts, where he studied at the local academy and converted to Methodism in 1830. Three years later he became a church elder and, consistent with the teaching of that faith, volunteered for missionary work among NATIVE AMERICANS out West. Accordingly, on April 28, 1834, Lee accompanied NATHANIEL J. WYETH's second expedition from Independence, Missouri, to the West Coast. Lee arrived at FORT VANCOUVER five months later and there encountered resistance from local authorities toward the establishment of a mission. He therefore headed south and took up residence along the Willamette River near present-day Salem, Oregon, where he conducted religious work among the Chinook (or Flathead) Indians.

Lee was conscientious in his work but gradually grew convinced that the mission, if it were to succeed at all, required more New England settlers to spur economic development. In March 1838 he departed Oregon for the East Coast, briefly visiting Washington, D.C., to drop off the settlers' territorial petition to Congress, and eventually found 51 willing recruits for the mission. These people, known in the Methodist Church's history as "The Great Reinforcement," accompanied him back to the West Coast aboard the ship *Lausanne*, arriving at the COLUMBIA RIVER in May 1840.

Lee resumed his missionary duties, but he also became increasingly drawn into the growing political arena of the region. As a major political figure himself, he authored the plan for what eventually became Willamette University. In February 1844 Lee once more departed Oregon for the East Coast to find additional volunteers, only to learn that the Methodist Board of Overseers had relieved him of his duties as head missionary. He angrily appealed their decision but grew despondent when he was not reappointed to the mission. He returned to Vermont later that year, where he contracted a severe illness and died on March 12, 1845. Lee's decade-long association with the settlers' movement in Oregon renders him a significant pioneer figure of that region. His detailed accounts of the western frontier, when

published in the next decade, spurred thousands of settlers to venture down the OREGON TRAIL.

## Liberia

Liberia is a West African nation founded in 1822 by American ex-slaves and subsidized by the AMERICAN COLONIZATION SOCIETY. The circumstances surrounding Liberia's founding reveal the conflicting motivations of Americans, black and white, who were concerned about SLAVERY and the presence of Africans in the young republic. Some whites supported colonization because they wanted to rid the nation of African people, whom they deemed unfit to live in a democracy. Some southern slaveholders advocated the removal of free blacks, whom they considered a threat to their ability to control their slaves. Other whites were more sympathetic to the discrimination experienced by free blacks in the United States; they argued that blacks would be relieved of such racism if they were returned to Africa. Other whites believed that ex-slaves should return to Africa to bring Christianity and European civilization to the continent. All of these groups were skeptical about whether African Americans would ever be accepted by a white populace whose political ideologies were increasingly racist.

Free blacks were also conflicted about the colonization issue. Some shared the view that African Americans would never be treated fairly in the United States, and should therefore return to Africa. Others disagreed, arguing that ex-slaves should stay in the United States to fight for civil rights as citizens and demand the abolition of slavery. Many saw the colonization effort as a cynical plot devised by slave owners to secure domination of their slaves.

Amid this growing debate, the American Colonization Society (ACS) was founded in 1817. As was common practice among reform societies of the time, the ACS raised funds by selling lifetime membership. By 1820, the society had published the first issue of *The African Intelligencer*, a magazine designed to spread the word about colonization. Edited by aspiring missionary Jehudi Ashmun, the journal contained articles about the slave trade, the prospects for founding an African colony, and a copy of the ACS constitution. Support for the cause was meager, however, and publication ceased after the first issue. However, by 1822 the Society was able to purchase land and establish a colony on the West African coast. Ashmun traveled to the new colony that same year, becoming one of the early leaders of the repatriation effort.

By the mid-1820s, support for the ACS had grown, and emigrants began to sail for the new colony, called Liberia. Influential political figures such as HENRY CLAY and former President James Madison were heavily involved in the organization. Sale of lifetime memberships had increased, giving the society the funds needed to continue developing and expanding the venture. Ashmun purchased or leased additional lands along major waterways, establishing the colony as a regional power able to intimidate neighboring tribes. In an 1825 treaty, several native kings agreed (often because Ashmun threatened to use force) to cede land in return for tobacco, rum, gunpowder, and other goods. The colonists established the first Liberian town at Cape Montserado, which they renamed Monrovia after President James Monroe. Members of the ACS continued to promote settlement, sending dispatches back to the United States that told of the emigrants' great success.

By the 1830s, colonization efforts were coming under attack by more radical reform groups working to abolish slavery. Abolitionists such as William Lloyd Garrison criticized the ACS for colluding with slave owners. This new school of abolitionists thought that colonization efforts were an attempt to strengthen slaveholders by removing the members of society most likely to question the slave system: free blacks. Abolitionists believed that colonizationists were undermining efforts to eradicate slavery by removing slave allies and by implicitly arguing that blacks should not be part of American society. The colonization effort continued, however, as free blacks emigrated to Liberia, and the ACS maintained their financial support. The organization even managed to convince some American state legislatures to help finance the effort.

Yet by the 1840s, the ACS could no longer afford to financially support Liberia. The colony was also in political jeopardy because it was not an official colony of the U.S. government, nor was it a sovereign nation. This precarious position endangered its future, because Liberians had no way to repel a political takeover by the British. In 1846, when the U.S. government refused to claim Liberia as an official colony, ACS leaders urged a declaration of independence. Thus, in 1847 the colony became the independent nation of Liberia, with Americo-Liberians (ex-slave emigrants and their descendants) controlling the government.

In the first decades after its founding, Liberian relations with the United States were strained. Because of the worsening American controversy over slavery, the federal government did not recognize Liberia until 1862. African Americans continued to emigrate to Liberia before and after the Civil War, but never in huge numbers. By the 1870s, the American Colonization Society had helped send over about 15,000 emigrants. The nation prospered at first, but it soon experienced economic decline due to competition from European commercial interests. Conflicts

between the American-Liberian elite and indigenous tribes also jeopardized political stability. These problems continue to plague the West African nation, which went on to endure civil war and rampant political corruption during the 20th century.

## Liberty Party

The Liberty Party was the first political party to run on an explicitly antislavery platform, nominating candidates for president in 1840 and 1844. The party, which was dominated by abolitionists, had little to say on issues other than SLAVERY. It generally garnered only scattered support at the polls but helped to lay the foundations for the FREE-SOIL PARTY in 1848 and then the REPUBLICAN PARTY of the 1850s. Members of the Liberty Party, many of whom were evangelical Christians, focused on the sinful nature of slavery and on rights for African Americans. They were also abolitionists who had broken with William Lloyd Garrison over whether they should involve themselves in electoral politics.

The AMERICAN ANTI-SLAVERY SOCIETY, which had been wracked by internal disputes for years, finally collapsed completely in 1839–40. Abolitionists such as Gerrit Smith of New York grew disillusioned with the WHIG PARTY when their leader HENRY CLAY came out in support of compromising with slave interests. They therefore began to search for a way to advance their cause in the political arena. The beginning of the Liberty Party as an independent political organization was controversial among many abolitionists, who feared that their efforts would divide their ranks and ultimately benefit the Democrats, the party most associated with slavery. The Liberty Party at its inception drew support from both Whigs and Democrats, but mainly from the former.

James Birney, the party's nominee in both of its presidential elections, was a Democrat. Born in Kentucky, Birney's father was a slaveholder who supported emancipation, as some of that class did at the turn of the 19th century. Birney himself later moved to Alabama, where he became one of the few proabolition members of that state's legislature. An early supporter of colonization, Birney freed his own slaves in 1834 when he moved back

to Kentucky. He later moved across the Ohio River to the state of Ohio, where he was indicted for harboring a runaway slave. Having renounced colonization, he embraced abolitionism and subsequently broke with the followers of William Lloyd Garrison in that he wanted a political and constitutional solution to slavery. Birney and others also did not share Garrison's belief that women should have equal voting and officeholding rights with men within abolitionist societies.

Members of the new Liberty Party believed that slaveholders could be persuaded to get rid of their slaves, as Birney had done. He was nominated at the first convention of the Liberty Party in Albany, New York, in 1840, along with Thomas Earle, an abolitionist Democrat from Pennsylvania, as six states sent delegates. He did not conduct anything resembling a campaign; in fact, he was in London attending the World Anti-Slavery Convention throughout the 1840 election season. When the votes were counted, his total was about 7,000, nearly all of them from the New England states as well as New York, New Jersey, Pennsylvania, Ohio, Illinois, and Michigan. Thus, the center of Liberty Party support, such as it was, came from areas strongly influenced by New England Yankee culture. The party ran candidates for state and local office in New England and in other northern states. Among those who supported the Liberty Party were Quakers and Presbyterians, including some from the South who had migrated into the states of the old Northwest.

The debut of the Liberty Party, despite its lack of success at the polls, was significant, as this was the first time there had been a national political party which ran on an avowed antislavery platform. Its weakness in its initial outing was demonstrated by the fact that an estimated 90% of those in abolitionist societies did not vote for the Liberty Party but instead mainly supported the Whigs and their successful candidate, HARRISON. When Harrison died soon after taking office and was replaced by a southern slaveowner, JOHN TYLER, some Whigs who had hesitated to leave their party for the Liberty Party now joined the ranks of the latter.

In 1844 the Liberty Party nominated Birney once again, this time with Thomas Morris, a former Democratic senator from Ohio, as the vice presidential candidate. That year, Joshua Leavitt, the editor of the *Emancipator*, the Liberty Party newspaper, published a controversial pamphlet, *The Great Duelist*, in which he linked Whig nominee Henry Clay to dueling and slavery. Leavitt portrayed Clay as a violent and sinful man who did not possess sufficient moral character to be president. In the election that year, the Liberty Party garnered 62,000 votes, which represented a nearly ninefold increase over their 1840 results and 2 percent of the national total. In the key northern states of New York and Michigan, Liberty Party voters, most of whom would have otherwise gone to Clay, were a crucial factor

in deciding the election in favor of Democratic nominee JAMES K. POLK of Tennessee.

The Liberty Party met again in convention at Buffalo, New York, in late 1847 to nominate a ticket for the next year's election. With Birney became incapacitated from injuries suffered in a fall from his horse, delegates nominated Senator John P. Hale of New Hampshire, an anti-slavery Democrat. Hale opposed slavery in principle but for constitutional reasons was reluctant to support the Liberty Party goals of abolishing slavery in Washington, D.C., and banning the interstate slave trade. For this reason, he waited almost two months before accepting the nomination. Before the campaign could begin in earnest, however, the Liberty Party dissolved as its members became one of the main groups that formed the new Free-Soil Party. That party had a broader constituency and wider set of goals, including providing settlers in the West with free homesteads and other provisions to draw Democrats and Whigs, than did the single-issue Liberty Party. Nonetheless, the Liberty Party had influenced the outcome of at least one presidential election and forced the nation as a whole to face more squarely the entire question of slavery. The party did fail in that its solution to slavery, that of repentance and peaceful dismantling of the slave system, did not come to pass, but rather its demise came about only after a horrific civil war. Even so, the Liberty Party can be considered one of the more important third parties of the 19th century.

## literature

In the years following the Revolutionary War Americans began to develop new forms of political and social life. At the same time, they began to create a new literary culture—one that was influenced by a combination of European sources and North American experience. In the colonial period, Americans were heavily influenced by literature from Britain and western Europe. Novels, poetry, religious tracts, political treatises, and other kinds of literature circulated in the colonies, shaping cultural and political identity. But the exchange was not one-sided. Not only did European works discuss America, Americans increasingly published homegrown literary works in response to conditions in the colonies and Europe. While American writers looked to European models and established writing techniques, they also looked to the frontier world around them to examine new American themes, concerns, and experiences.

In the course of the generation after 1815, new strands appeared in American literature, including writings by Native Americans, African Americans, and a new kind of popular literature, aimed at a more broad-based audience. William Apess (or Apes) (1798–1839) was a Native American whose varied writings made him a literary figure of some influence. Born in Franklin County, Massachusetts, to a Pequot mother and a mixed race father (part Pequot, part Anglo-American), Apess aspired to be a Methodist minister. Denied a license to preach as a Methodist because of his Indian ancestry, Apess left the Methodist Episcopal Church and joined the Methodist Society, which ordained him without reservation in 1829. The same year, Apess published *A Son of the Forest: The Experience of William Apess, a Native of the Forest*. Although this autobiography may have been written as part of a church requirement to document his religious life, its publication was a powerful statement that Native Americans were equal to Euro-Americans in the sight of God, and it called for fair and equitable treatment of these people. Over the next nine years, Apess preached and wrote. He published three other books and a collection of sermons. The message of these works, like his first, was a challenge to the prevalent Euro-American assumptions of racial superiority. He also attacked the uses of European missions to the Indians as an exploitation of Native peoples and he described missionaries as agents of Euro-American imperialism bent on keeping the Indian peoples in an inferior position in American life. These strands came together in the practical arena with Apess's defense of the Mashpee and their lands in Massachusetts.

The 19th century saw the appearance of a broad-based popular literature for the first time. Washington Irving and James Fenimore Cooper were among the first American authors with a wide appeal to an American audience, but others who wrote in an even more popular vein followed them. The most important of these authors was George Lippard. Born on a farm in Chester County, Pennsylvania, Lippard first worked as a lawyer's assistant in Philadelphia, where he encountered the underside of American urban life. In 1842 he left the law to write a satirical column for a Philadelphia newspaper, *The Spirit of the Times*. In 1844 he published his first novel, *The Ladye Annabel; or, The Doom of the Poisoner*, a gothic tale of torture and the grotesque. His friend Edgar Allan Poe praised the inventive nature of the work. The next year, Lippard published the novel that would make him famous and would give him a place in the annals of American literature. *The Quaker City; or, The Monks of Monk-Hall* (1845) was an account of sexual depravity and drunkenness among Philadelphia's upper class. It marked Lippard's transition to social reformer and social commentator as well as gothic novelist. The novel was an instant best-seller, and it sold some 60,000 copies in

the first year, the largest sale for an American novel until the publication of Harriet Beecher Stowe's *Uncle Tom's Cabin* (1852). Lippard wrote several other novels that dramatized upper-class depravity and urban corruption. Among the most important were *The Empire City* (1850) and *New York; Its Upper Ten and Lower Million* (1853). Lippard became a popular lecturer, and he worked tirelessly on behalf of labor groups. His novels are noteworthy as among the first products of a popular culture, whose themes had a pointed social message mixed with the gothic formula of the period.

With the emergence of the abolitionist movement in the 1830s came an interest in slave narratives. Written with a striking immediacy, these accounts of life in slavery became an important part of the abolition movement and entered into the life of American literary publications. The most important of these writings was Frederick Douglass's *Narrative of the Life of Frederick Douglass, Written by Himself*. This autobiography, an account of his early life in slavery and his escape, was written in part as exposition of the evils of the institution of slavery and in part as a way to establish the legitimacy of Douglass's early life as a slave. The book sold 30,000 copies in the United States and Britain, and it helped to make Douglass the most important African-American representative in the abolition movement and the most significant African-American author of the day. An accomplished writer and charismatic public speaker, Douglass appeared before northern audiences for 30 years. His autobiography was perhaps the most powerful literary statement in the anti-slavery roster of written accounts. Douglass also founded and edited his own newspaper, *The Northern Star* (1847). In 1852, Douglass published a novel, *The Heroic Slave*, which is generally considered the first major African-American fiction. The novel's central character was the leader of a violent slave revolt, and the book represented Douglass's shift in opposing slavery from moral suasion to activism, including armed rebellion.

The most prominent writers of the early 19th century included Washington Irving and James Fenimore Cooper, members of what became known as the Knickerbocker School. Irving's writings attempted to create a kind of American folk literature, with his satirical stories of early New York told by "Diedrich Knickerbocker." His *Sketch Book* (1819–20) introduced the famous stories "Rip Van Winkle" and "The Legend of Sleepy Hollow." He also published several histories, including his famous *Life of Washington* (1855–59). Irving's characterizations of American life were intended not only to entertain but also to develop his ideas about national identity and his sense of specifically American values.

Cooper's most important works were collectively known as the *Leather-stocking Tales*, some of the first American novels set in the rapidly developing American frontier.

In *The Pioneers* (1823), Cooper combines elements of the sentimental and adventure novels to tell the story of life in the frontier town of Templeton (based on Cooperstown, New York, the settlement started by his father in the post-revolutionary years). He continued this story of the struggle between civilization and primitive savagery on the frontier at various points in American history with *The Last of the Mohicans* (1826), *The Prairie* (1827), *The Pathfinder* (1840), and *The Deerslayer* (1841). Cooper also wrote sea-adventure stories and volumes of social criticism that detailed his aristocratic fears about democracy run amok in the Jacksonian era. Other writers in the Knickerbocker School included poet William Cullen Bryant, James Kirke Paulding, and Fitz-Greene Halleck.

In a movement that became known as the "New England Renaissance," writers from this region developed a distinctive literature and philosophy from the 1830s to the Civil War. The transformation of intellectual life in New England could be said to begin with the Unitarian sermons of William Ellery Channing, who challenged religious orthodoxy and promoted a more liberal vision of spiritual life. The critiques raised by Unitarians later influenced the thinking behind the TRANSCENDENTAL MOVEMENT. Transcendentalists like RALPH WALDO EMERSON and HENRY DAVID THOREAU believed in the sanctity of individual experience and the divinity of nature. They promoted self-determination, the primacy of individual experience, and the divine connection between all living things. This philosophy was most apparent in Emerson's *Nature* (1836), *The American Scholar* (1837), and *Poems* (1847). Thoreau's most famous work, *Walden* (1854), detailed his experience living the simple life by Walden Pond in Concord, Massachusetts. In this account and his 1849 essay "Civil Disobedience," Thoreau presented a vision of principled action against the state and the right of individuals to listen to a higher moral law in place of a state law. Other transcendentalists included MARGARET FULLER, George Ripley (founder of the influential but short-lived BROOK FARM), Bronson Alcott, and Orestes A. Brownson. These thinkers were interested not only in realizing individual consciousness but in reshaping society to help people better realize social harmony.

Transcendentalist ideas about the place of the individual in the universe influenced other New England writers, most notably Nathaniel Hawthorne and Herman Melville. Both writers were more pessimistic about human potential than the transcendentalists were, but their singular styles owed a great deal to the ethos of the New England Renaissance. Hawthorne's greatest works examined the interior lives and sins of New Englanders. In *The Scarlet Letter* (1850), he gives his interpretation of the moral and spiritual conflicts of Puritan New England. In *The House of the Seven Gables* (1851), he again uses history as a major

Nathaniel Hawthorne (Library of Congress)

theme, showing how the sins of the past are revisited on the present within an old New England family. His other writings include *Twice-Told Tales* (1837) and *The Blithedale Romance* (1852).

Melville began his writing career with sea romances like *Typee* (1846), *Omoo* (1847), *Mardi* (1849), and *Redburn* (1849). These tales derived partly from his own experiences as a sailor, and were well received by the public. His later works, beginning with his masterpiece *Moby-Dick; or The Whale* (1851), transcended the sea-tale genre, developing a completely singular style and a dark sensibility. Indeed, although several of his later works were set at sea, they were more concerned with larger moral questions than in detailing life on the sea. His story “Benito Cereno” (1856) deals with the horrors of slavery, and his novella *Billy Budd* (published posthumously in 1924) describes conflicts between loyalty and justice, love and betrayal. Melville also wrote several works dealing with the dark side of the emerging American urban life, most notably “Bartleby the Scrivener” (1856) and *The Confidence-Man* (1857).

Other major writers examining the emerging urban America were Walt Whitman and Edgar Allan Poe. Whitman’s poetry collection *Leaves of Grass* (1855, later expanded) expressed his optimism about human potential, celebrating democracy and the teeming urban life of New York City. Poe’s style, in poems and prose, was much darker, dwelling on elements of the romantic, horrific, and grotesque. His major poems include “Annabelle Lee” (1847) and “The Raven” (1845). He published only one

novel, the bizarre sea adventure *The Narrative of Arthur Gordon Pym* (1837); and numerous masterful and macabre stories, including “The Gold Bug” (1843), “The Murders in the Rue Morgue” (1843), “The Pit and the Pendulum” (1842), and “The Tell-Tale Heart” (1843). Other important poets of this period include Henry Wadsworth Longfellow and James Russell Lowell.

Probably the most influential and popular literary works of this period were written by women. Writers like Lydia Maria Child, Catharine Maria Sedgwick, Harriet Beecher Stowe, SARAH JOSEPHA HALE, Susan Warner, and Mrs. E.D.E.N. Southworth wrote some of the most loved and esteemed works in the decades before the Civil War. Their writing could be categorized as sentimental and concerned with social and individual reform. These “reform novels” addressed some of the most controversial issues of the day, attempting to reach a wide audience and appeal to their moral conscience. Warner’s *The Wide, Wide World* (1850) became the best-selling novel since *Charlotte Temple*, only to be topped two years later by the phenomenal success of Stowe’s antislavery novel *Uncle Tom’s Cabin* (1852). Stowe continued her attack on SLAVERY and FUGITIVE SLAVE LAWS with *Dred: A Tale of the Great Dismal Swamp* (1856). Her novels are credited as among the most influential forces to bring the conflict over slavery to a head in the 1860s. The rise of professional women writers in America signalled an advance in women’s opportunities to become part of the public sphere.

Another important literary development in the antebellum period was the increasing availability of reading materials. Improvements in the printing process triggered the rise in periodicals and the penny press—pulp genre fiction that could be mass-produced and sold cheaply. The establishment of free public education, libraries, and lyceums provided ready access to all types of literature. These institutions and the books they supplied were supposed to promote moral and social improvement through learning. The dissemination of such a diverse American literature reflected and shaped the controversies of the antebellum period, such as slavery, the position of women, the expansion and settlement of the West, and the rapid growth and INDUSTRIALIZATION of cities.

**Lovejoy, Elijah** (1802–1837) *abolitionist, editor*

An abolitionist and editor of several antislavery newspapers, Elijah Lovejoy lost his life while guarding one of his presses. Born in Maine in 1802, he graduated from Colby College in 1826, taught school, and in 1827 moved to St. Louis. In 1832, having made the decision to enter the ministry, Lovejoy enrolled in the Princeton Seminary. After receiving his license to preach, he returned to St. Louis to edit the *St. Louis Observer*, the Presbyterian weekly paper. Gradually over the next few years, his editorials in the paper moved from theology to antislavery and the TEMPERANCE MOVEMENT. The St. Louis area was a hostile one for his new principles. Rather than change the content and tone of his writings, in 1836 Lovejoy moved across the Mississippi River to Alton, Illinois.

Illinois was a free state, but its southern and western boundaries were the Ohio and Mississippi Rivers, and SLAVERY was entrenched on the far side in Kentucky and Missouri. Alton had a strong community of former New Englanders who welcomed Lovejoy's views. It also had a surrounding countryside and a southern reach toward Cairo that supported the institution of slavery and violently opposed any suggestion of greater rights—whether political, economic, or social—for African Americans. Lovejoy changed the name of his paper to the *Alton Observer*

and continued to publish his outspoken views on the evils of slavery.

Lovejoy's struggle to express his increasingly radical views and the appearance of a violent resistance against him came to revolve around his printing press. His first press was seized from the wharf in Alton and dumped into the river. A meeting of local citizens deplored this act and pledged support for another press; at the same time, they were careful to distance themselves from the editor's abolitionist ideas. The views of this meeting seemed to express a consensus of the town: Lovejoy was welcome to publish a newspaper about Presbyterian Church issues; he was at risk when he ventured into the areas of slavery and abolition.

Lovejoy promised to confine his published views to church issues, but he gradually returned to his abolitionist foundations. On July 4, 1837, he printed an editorial that called for a meeting of antislavery followers in the Alton area to form a branch of the AMERICAN ANTI-SLAVERY SOCIETY. This call reawakened his opposition, and attacks on his newspaper became ever more vehement. The meeting took place, and the new antislavery society was organized in October 1837. As anger and tension rose, Lovejoy's friends urged him to leave Alton, if only temporarily. He refused. The Ohio Anti-Slavery Society promised him another press to continue his work. When the new press

This engraving shows the mob attack on the offices of Elijah P. Lovejoy. (Library of Congress)

arrived on November 7, a riot took place between proslavery and antislavery factions, and in the confusion that followed, Lovejoy was shot and killed. He thus became one of the great martyrs of the ABOLITION MOVEMENT.

## lumbering

Wood had been an essential commodity to Americans since colonial times, and in the first half of the 19th century lumbering became one of the most important parts of the national economy. Its products were used in virtually every aspect of everyday life, from construction of housing and bridges to nails, hinges, locks, tools, and other household implements. As early as 1839, no less than 84 percent of all personal dwellings were made from wood. A high volume of wood was made into staves, which were used to construct barrels for such perishable items as tobacco, sugar, whiskey, pork, and pickled beef, as well as tar and pitch, which were essential for the naval stores industry. But above all, wood was a cheap and reliable source of energy for home and industrial heating.

By the 1840s the demand for wood increased because of the growth and spread of RAILROADS: Wood was a far easier and cheaper fuel to procure than coal. As late as 1860, the majority of 4,000 locomotives operating in the United States were fired by wood, with only 400 or so powered by coal. Wood was also a vital construction material for railroad ties, railcars, water towers, and bridges.

Not surprisingly, the need for wood grew exponentially with the rising American population. Lumber production rose with demand, expanding from 1.6 million board feet in 1839 to 8 billion board feet by 1859. Not until the 1880s did wood begin to be replaced by iron and stone in the construction industry. Meanwhile, increased mining of coal made that material sufficiently inexpensive to compete with and eventually eclipse wood as a source of fuel.

Initially, there was major lumbering activity in northern New England and the southern coastal states, but the industry drifted westward as supplies of white pine, the most sought-after wood, were exhausted in those regions. By 1839 the center of the industry had relocated to western New York and Pennsylvania, and within a decade lumbermen migrated farther west to exploit the tall timber of the Great Lakes states. By 1840 Wisconsin, Michigan, and Minnesota were the most important sources of wood production in the United States, and they remained the industry locus until the turn of the century.

Lumbering's growth was helped along by the adoption of new technology. Common axes gave way to two-man

crosscut saws, and sawmills began to use water- and steam-powered machinery to cut planks and boards. For many years transportation was limited to shipment by water, which required lumbering operations to be situated near rivers so workers could float log rafts to market. By the 1850s, however, an extensive network of railroads allowed lumbering concerns to arise in relatively remote areas along established railroad lines. In this manner Chicago and other interior cities accessible by railroads became major marketing and wholesale centers for the lumbering industry.

## lyceum movement

The lyceum movement was the first adult-education program in America. It was a major force in American cultural life from the mid-1820s through the 1850s. From its origins in New England, the lyceum concept spread across the nation's northern states and territories, traveling to the West Coast with the movement of the frontier settlers. It influenced the development of public education, fostered such ideas as abolitionism and women's rights, and nurtured the rise of American arts and letters.

Connecticut-born educator Josiah Holbrook (1788–1854) opened the first American lyceum in 1826 in Millbury, Massachusetts. Holbrook aimed to use lectures and debates to bring new ideas—both philosophical and practical—to members of his own community. The name and, to some extent, the concept was based on Aristotle's famous Lyceum in ancient Athens. Holbrook hoped that his lyceum would become a study group that would meet on a regular basis and allow all members to teach one another and share learning experiences. He believed that learning should continue through the course of a lifetime and that no social factor such as class, gender, age, profession, or lack of previous education should be permitted to stop that process.

Holbrook's lyceum was so successful that local lyceums began to spring up throughout Massachusetts. In 1831, he formed the National American Lyceum, which encouraged the development of local lyceum groups, first in New England and later across the country. By 1834, there were an estimated 3,000 lyceums in the United States. Some were set

up under the aegis of Holbrook's national organization, but many more were independent groups. The National American Lyceum closed in 1839, but the lyceum movement itself continued to grow. Holbrook toured the country, speaking about and gaining favor for his ideas until his death in 1854.

Many lyceums soon began to offer lectures given by outside speakers, de-emphasizing the mutual learning model envisioned by Holbrook. The speakers initially worked for little or no money, but as demand for their services grew, their fees rose. It was as difficult then as it is now to support oneself by one's pen, and men and women of letters quickly realized that the speaking fees offered by lyceums could make up a crucial component of their income. RALPH WALDO EMERSON, HENRY DAVID THOREAU, Oliver Wendell Holmes, Frederick Douglass, and many more of the leading intellectual lights of the day made lecture tours on the lyceum circuit. It was a common practice for writers to "test-market" their latest poems or philosophical ideas on lyceum audiences before attempting to publish them. Inevitably, booking agencies sprang up to

place speakers in the lyceum venues, whose numbers had grown to perhaps 5,000 nationwide by 1839.

The lyceum movement remained forceful throughout the 1850s, but the turmoil brought by the Civil War forced many local lyceums to close. The movement never regained its strength once the war was over, although individual lyceums continued to thrive in subsequent decades. The lyceum movement did raise public expectations for educational opportunities for both adults and youths, and these expectations encouraged communities to establish public schools, libraries, publicly supported museums, endowed lecture series, university extension courses, home-study programs, and the Chautauqua movement of the 1870s.

## **Magoffin, James W.** (1799–1868) *trader, spy*

James Wiley Magoffin was a successful Santa Fe trader, a spy in the MEXICAN-AMERICAN WAR, and the founder of El Paso. Magoffin was born in Harrodsburg, Kentucky, in 1799, although little else is known of his early years. He was apparently active in trade along the SANTA FE TRAIL, and in 1824 he was dispatched by boat to serve as the American consul in Tampico, Mexico. Magoffin managed to survive a shipwreck in Matagorda Bay before taking up residence there, and over the next decade he married a Mexican woman and established a lucrative mercantile business. When the TEXAS REVOLUTION began in 1836, he relocated his family from Saltillo to Chihuahua City and resumed his thriving business activities in the Santa Fe trade. In time Magoffin became prominent in local politics and was hailed as “Don Santiago” by his neighbors.

In 1844 Magoffin moved his family to Independence, Missouri, where he maintained two wagon trains in the Santa Fe trade. In 1846 he tendered his services to General STEPHEN W. KEARNY in the Mexican-American War (1846–48). His knowledge of northern Mexico proved extremely useful, and it was apparently a clandestine meeting with Governor MANUEL ARMIJO, his wife’s cousin, that induced the governor to abandon New Mexico without firing a shot. Magoffin subsequently worked as a spy for General John E. Wool in Chihuahua, but he was caught and imprisoned for the remainder of the war. In 1849 Magoffin received a secret payment of \$30,000 from the United States government for his intelligence work.
